GERMANY.—The *Leipsic Gazette* states that the late Duke Ernest of Saxe Coburg and Gotha has left personal property to the amount of twelve millions of florins, and has not disposed by any will or testament of this large fortune. It was supposed that according to the laws of inheritance in Saxony, by which personal property left by a father is equally divided between the children, this large fortune would be divided between the now reigning Duke Ernest and Prince Albert, whose share in that case would have been about 600,000*l*. The statement, however, appears to be erroneous, as the estates are all strictly entailed, and will of course devolve upon his Royal Highness's eldest brother.—A letter from Vienna of the 12th inst. says it is now certain that the Emperor and Empress of Russia will honour that part of the world with their presence in the course of next winter. The Empress intends to pass several weeks at the baths of Bohemia for the benefit of her health; and the Emperor it is said will visit Vienna. The Duke de Bordeaux had, on his arrival at Goritz, found the Duke d'Angoulême much better; but the Prince would appear to have since had a sort of relapse.

ITALY.—Accounts from Italy state that the disturbances in the Pope's dominions are on the point of being renewed. A letter from Ancona of the 6th, states that the Carnival has been suspended there in consequence of the assassination of Judge Alessandrini, one of the Members of the Extraordinary Commission instituted to prosecute the rebels of Bologna. It appears that as the Judge was passing down the street, escorted by two gendarmes, a man wearing a mask rushed on him, and plunged a dagger into his back. The crowd opened its ranks to the assassin, who mingled with the other masks that filled the public way, and escaped. M. Alessandrini is not dead, but no hopes are entertained of saving his life. The police have not as yet discovered the murderer.—The Pope consecrated as bishops four of the cardinals on the 11th ult. This is the first instance it is said for 150 years of the Pope having performed this ceremony in person. The Prince of Wurtemberg, Don Miguel, and all the diplomatic corps, were present on the occasion.—Letters from Naples mention that the King has adopted an extraordinary resolution. He has reduced the interest on the public debt from five to four per cent. by a Royal decree, which was to be published on the day the packet-boat sailed. This act created a great fall in the funds, and increased the discontent which for some time previously had been manifest throughout the kingdom. The Count de Aquila was to leave Naples on the 15th for Rio Janeiro, in order to celebrate his marriage with the Princess Januaria. The Princess will leave the Brazils with her future husband for two years, but will return at the end of that time should the Emperor of Brazil have no children.

GREECE.—Letters from Athens of the 10th ult. state that the Legislative Assembly continued engaged in discussing the draught of the Constitution. The first 15 articles had been adopted, and were for the most part a literal translation of as many articles of the French charter. The paragraph relative to the form of Government had been the occasion of a lengthened and animated debate. The people were anxious that there should be only one Chamber, but the opinion of the champions of that principle had been overruled, and after two eloquent appeals from M. Metaxa, the President of the Council, and M. Petsalis, the member for Kalcis, the Assembly had decided that the Government should consist of a King, a Senate, and a Chamber of Deputies. They moreover resolved that the crown should be hereditary, and descend in a right line to King Otho's legitimate heirs, and that in

the event of his Majesty dying without issue, it should devolve upon his younger brother and his legitimate descendants. The successor to the throne must be a member of the Greek orthodox church. King Otho had been very ill for some days, but had recovered.

SWEDEN AND NORWAY.—Accounts from Stockholm of Feb. 18 state that the King had very restless nights from the 11th to the 16th, with great pain in the leg. Notwithstanding his weakness, His Majesty had sufficient strength of mind in the latter days of last week to listen to the articles in the journals, and to have the bulletins read to him before they were published. In the proclamation of the Norwegian Government, announcing the transfer of the Administration to the Crown Prince, reference is made to a resolution of the Diet of the 4th of May, 1818, so that the doubts which were entertained here whether the transfer would be legal in that kingdom are removed.

SWITZERLAND.—Princess Galitzin, grand-daughter of the renowned Russian General Suwarrow, has arrived at Berfoix, where she resided for several years after she embraced the Protestant faith. During her last residence in the Russian dominions the Princess was by orders from high authority, confined in a convent, from which it cost her much trouble to get liberated. Her children are not permitted to be with her.—One of the most eminent political writers of Switzerland, and the chief of the aristocratic party, M. Charles Schnell, committed suicide lately by drowning himself in the river Aar, near Langenthall.

UNITED STATES.—The packet-ship Washington arrived at Liverpool on Thursday, having left New York on the 9th ult. Mr. Benton offered in the Senate, on the 30th Jan., a resolution inquiring whether slaves escaping to the British dominions since the treaty of 1842 had been given up; and also a resolution proposing that the provision of the treaty of 1842 relative to the surrender of criminals escaping from justice be terminated. On the following day the first resolution was agreed to; and the second, on the motion of Mr. Benton, was postponed. On the 5th Feb. Mr. Hannegan presented some extravagant resolutions from the Legislature of Indiana, instructing their senators to use their efforts to procure measures for the immediate possession of the Oregon territory, "*peaceably* if they can, *forcibly* if they must." The resolutions speak of the "grasping spirit and insatiable ambition of the British Government," and they were, it seems, passed unanimously, or nearly so. In the House of Representatives the report on the rules was considered, and Mr. Stiles of Georgia spoke in favour of the 21st rule. He contended that it did not abridge the right of petition; that it left the people free to petition for the redress of grievances; that slavery was not a grievance to the petitioners in the contemplation of the Constitution; that the Constitution gave no power to remove such a grievance; and that slavery and the Constitution were linked together, and both must stand together.—The weather continued to be unprecedentedly severe; it had closed up the ordinary channels of communication, suspended all transit by water, and interfered with the progress of business. No less than 11 mails were due from New Orleans. The Boston papers detail, with tedious minuteness, the exertions which were made to free the Britannia from her ice-bound position. Out of the 400 men who were employed to cut her through the ice, which appears to have been a task of immense labour, many were frost-bitten and seriously injured.—The New Orleans papers report the death of Judge Porter, which took place at his plantation, in the parish of St. Mary, on the 13th ult. He was a native of Ireland, formerly a member of the State Legislature, Judge of the Supreme Court, and at the time of his death, a member of the United States Senate.

Parliament.

HOUSE OF LORDS.

Friday.—The Bishop of EXETER, as we stated briefly in our last, moved for the appointment of a select committee to consider the provision made, and which may be required to be made, for the spiritual worship and instruction in the union workhouses in England and Wales. He prefaced his motion by detailing to their Lordships the several instances in his own diocese, and in many parts particularly of the north of England, of the disastrous effects upon the morals and habits of paupers occasioned by the want of chaplains and proper instructors. He denounced the pecuniary savings thus screwed from the poor by political economists and jealous Dissenters, and demanded of the Government to do something to compel the Poor Law commissioners to issue instructions to the several boards of guardians to provide for the spiritual and educational wants of the inmates of their workhouses.—Lord WHARNCLIFFE hoped the right Rev. Prelate would not consider that he wished to advance any general defence of the boards of guardians for their conduct on this subject, for he really thought they ought to appoint chaplains, but it should not be forgotten that the general body of the Poor Law guardians in many parts of the country consisted of those whom it was very difficult to satisfy that they ought to incur any expenses which they were not themselves impressed with the necessity of. The Poor Law commissioners were not much to blame, because they had only a doubtful power under the Act, which they were obliged to execute with the greatest discretion. With respect to the motion of the right Rev. Prelate, he objected to it because he thought that if the proposition to go into a committee upon this subject were adopted, it would excite feelings elsewhere which would be prejudicial rather than advantageous to the object it was desired to promote. At the same time it might be well to introduce some more stringent provision on the subject of appointing chaplains into the Bill now before the House of Commons for the amendment of the Poor Law, and he hoped it might be possible that this might be the case, and that the law might be assimilated, perhaps, to that which was contained in the Irish Poor Law Act.—The Bishop of SALISBURY rejoiced at the prospect of a remedy being supplied to the general lack of spiritual instruction, by the means suggested by the President of the Council; and the Bishop of EXETER expressing himself satisfied with the opinion announced by Lord Wharncliffe, allowed his motion to be negatived without a division.

Monday.—A desultory conversation took place between the Marquesses of NORMANBY and WESTMEATH respecting a statement that a Roman Catholic priest had been suspended by his Bishop for having refused to collect the Repeal rent; but they were called to order by the Duke of WELLINGTON, who having pointed out the inconvenience of such a growing practice, reminded the Noble Lords that there was a standing order of the House, which forbade any Peer to make a speech unless he concluded with a motion, or spoke to some motion regularly before their Lordships.—Lord BROUGHAM said, amidst much laughter, there never was an order so much violated. He often heard Noble Lords making long speeches without concluding with a motion. His Lordship then put two questions, without notice, to the Foreign Minister, concerning Otaheite and the Poles of Posen.—The Earl of ABERDEEN pleaded Lord Brougham's last opinion on Parliamentary etiquette as an answer to the question.—Lord CAMPBELL called attention to an incidental remark made by Lord Roden in the late Irish debate concerning the conduct of Mr. R. O'Gorman, one of the Grand Jurors on the late trials in Ireland, and endeavoured to exculpate Mr. O'Gorman from censure in having come into Court after the bills were found, and stated that he had not agreed to that finding.—Lord WHARNCLIFFE, without giving any opinion of the loyalty of Mr. O'Gorman's conduct, said the practice in England was, that no Juryman having sworn "to keep his own counsel, and that of his fellow Jurors," ever made statements of the kind; and certainly a contrary practice would be exceedingly inconvenient.

Tuesday.—After the presentation of two petitions against the Corn-laws, by the Earl of YARBOROUGH, the Marquess of LANSDOWNE presented a petition from the Provost and Town Council of Glasgow, complaining of the religious tests imposed upon the Professors in Glasgow College, and praying that such tests might no longer be imposed, except upon the occupiers of chairs connected with Theology.—Lords BROUGHAM and CAMPBELL supported the petition, after which the House adjourned.

Thursday.—Petitions were presented by the Earl of YARBOROUGH and the Duke of BUCKINGHAM, praying for protection to agriculture.—The amendments of the Commons to the Horse Racing Penalties Bill were ordered to be printed—to be taken into consideration on Friday.—The Earl of RADNOR postponed the presentation of the Somersetshire petition on the Corn-laws to Monday week, in consequence of the Duke of Wellington's absence from the House.

Friday.—Lord MONTEAGLE wished to know what steps had been taken with respect to the Landlord and Tenant Commission in Ireland.—The Earl of DEVON said, the Commissioners had been busied up to the present time in receiving evidence on the subject; he had been lately subpœnaed in a case before the assizes in Devonshire, which he regretted might impede the operation of the commission of which he was Chairman for some time.—Lord BROUGHAM moved for a return referring to the treatment of missionaries in the South Sea Islands.—The Earl of ABERDEEN said there would be no objection to the returns. For a considerable time past the missionaries had made no complaint, and no further than two days ago the Missionary Society assured him that the missionaries in no manner of way complained of the conduct of the French Government. He was happy to state, explicitly and positively, that the French Government had given up all interference with the island of Tahiti. He had no doubt but the war party might assert that the French Government had been forced into this arrangement, but he had not interfered in the matter at all; it was, therefore, the spontaneous act of the French Government.—Lord BROUGHAM expressed himself gratified at the intelligence.—The Gaming Penalties Bill and amendments were agreed to.

HOUSE OF COMMONS.

Friday.—We resume our summary of the debate on Ireland, of which, from the late hour (4 o'clock on Saturday morning) at which the House adjourned, we were only able to give a brief notice in our last, with the result of the division. After the speech of Sir F. Pollock, Mr. ROEBUCK traced the causes which have engendered that national antipathy, and physical destitution, which render the social state of Ireland a matter of so much alarm. He paid a compliment to the policy of the late Government, and charged the present with having, in order to obtain power, revivified that bigotry which was the prime cause of their present difficulties. After noticing Mr. Shaw's declaration, that the Church is to be maintained because it is built on religious truth, he proceeded to an examination of the management of the state trials, and affirmed that Mr. O'Connell had not had a fair trial; that they had exalted him into the rank of a martyr, and were now turning towards him all those English sympathies which his own imprudence had alienated.—Mr. O'CONNELL now rose, and said he was not about to speak of himself; he had come for a different purpose—to make a protestation and to ask a question—to protest against any new wrong to his country, and to ask how Ireland was to be governed. He recapitulated his view of the question; described the state of Ireland before and after the Union; recounted the history of the struggle, which, from the commencement of the present century was carried on till it ended in Catholic Emancipation; and depicted the present state of Ireland, whose frightful condition, neglected and unjustly used as it had so long been, was the true source of the power of the "demagogue." He alluded to the kindly feeling which had been displayed towards him in England, from whence he drew the conclusion that the bulk of the English people were disposed to do justice to Ireland; and he passed in review the measures of amelioration announced by the Government, pronouncing them inadequate to the necessity of the case. On behalf of the people of Ireland, he called on them to view its condition with the eyes of statesmen, especially on the subject of the Church, whose maintenance in its present anomalous position was opposed not only to sound policy, but even to the interests of truth itself. Another crisis had arisen in the history of Ireland; let them not blindly mistake it, as of old. He would co-operate with them, heart and soul, in whatever would promote the welfare of Ireland. He was going back to Ireland to convey the answer of Parliament, but he feared it would not be a satisfactory one. His anxiety was to see men act together like brothers, without distinction between English and Irish, Protestant and Catholic.—Sir ROBERT PEEL commenced his speech by noticing briefly some of the arguments of Mr. O'Connell for the Repeal of the Union. He thought that the hon. and learned gentleman would better secure his own permanent fame if he were to bring his arguments and statements to the test of the House of Commons, instead of imposing them on the ignorance of multitudes. Passing from thence to the motion, he characterised it as a party one, its object being simply the attainment of place, with which view Lord J. Russell seemed, in framing it, to be solving a problem in political fluxions, combining the greatest amount of crimination with the smallest quantity of committed responsibility. Vindicating Lord Lyndhurst, he retorted the attack, by adverting to Lord Plunket, the pride of the Whig party and the ornament of the Irish bar, who was displaced from his deservedly-attained high station of Chancellor, in order to gratify the vanity of a Scotchman by a six weeks' tenure of office. This was Lord J. Russell's sympathy with Ireland!—*he* would not have retained office an hour under such a humiliation. He emphatically denied the imputation of seeking to entrap Mr. O'Connell and his associates. The Government, though alarmed by the meetings, were yet in difficulty as to the safest and most effectual method of interfering, having, as he assured the House, a very strong opinion against a resort to extraordinary powers or a coercion act. But the days and the sites of the latter meetings—Tara, the Rath of Mullaghmast, Clontarf—all awakening passions embittering national hatred, and for an object calculated to roll back the tide of civilisation—all showed that the Repeal Association were seeking a legal object by illegal means. But the specific ground on which the Clontarf meeting was proclaimed was the "military array," which, in the opinion of the English law officers of the Crown, distinctly marked it out from all the others as an unlawful assembly. Not only did they proclaim that meeting, but they resolved to prosecute, not the subordinate agents, but the authors of the dangerous agitation. Not the printers, but the Repeal Association was responsible for the circulation of those ballads and speeches by which an inflammable people were excited. The only instrument left to the Government was the common law—the same law under which the Chartists were prosecuted; and having called on the prime movers of this pernicious agitation to answer to the country, they succeeded in obtaining a descriminating verdict from a jury directed by a unanimous bench. And now, having vindicated the law through the ordinary powers of the law, a powerful party come forward to arraign their conduct, and, with the keen instincts of party, hunted out every little incident in the trials. Had they prosecuted some poor printer with what different shouts would the walls of the House of Commons have rung—what taunts that they had not dared to assail the favourites of the people! This he would say, in the face of the country, that the Government, in repressing this most dangerous agitation, had received no assistance from the Opposition. Such was not the course of the Ministerial party when in opposition; if they had not aided the Whigs in repressing the fires of Bristol, the Newport insurrection, &c., the then Government would not have found their task so easy. Turning to the question of what was to be the future legislation for Ireland, he declared that the Landlord and Tenant Commission was intended to make a searching inquiry into a subject on which premature legislation had been repeatedly tried; and with respect to the franchise, he admitted the principle that there should be substantial equality in Ireland as compared with Britain. On the subject of the Established Church he dwelt at considerable length, enforcing the obligation of compact, but admitting at the same time that Parliament had the unfettered power to alter the compact if it should think fit. His own opinion was decidedly in favour of an establishment, and in favour of the Protestant Church as that establishment. He denied that if a country established a certain form of religious doctrine it necessarily involved an insult to those who differed from it; and in all the projects for altering or dividing the Established Church in Ireland, he saw no security for religious peace and concord. He therefore came to the conclusion, on conscientious conviction and policy, that that church should be maintained in its integrity, admitting any reform which would ensure its vitality and promote its usefulness. The Government were willing to afford facilities for legalising voluntary endowments in favour of the Roman Catholic clergy; they intend to augment the grant for national education. But in regard to a pecuniary provision for the Catholic clergy, Mr. O'Connell and the clergy themselves had declared that they would not accept it. He referred with emotion to the sacrifices which he had made for Ireland, when in order to carry emancipation, and as he had hoped to insure her tranquillity, he had risked private friendship and political connexion, and forfeited the cherished representation of that university where his earliest ambition had been gratified. He hoped that if party did not mar the endeavour, Ireland might yet be governed by the ordinary law, and expressed his belief that there was a growing disposition to discard mere party feeling. He concluded by saying,—"Hereafter, in whatever capacity I may be, I should consider that the happiest day of my life when I could see the beloved sovereign of these realms fulfilling the fondest wishes of her heart—possessing a feeling of affection towards all her people, but mingling that affection with sympathy and tenderness towards Ireland. I should hail the dawning of that auspicious day when she could alight, like some benignant spirit, on the shores of Ireland, and lay the foundations of a temple of peace—when she could, in accents which proceeded from the heart—spoken to the heart rather than to the ear,—call upon her Irish subjects of all classes and of all denominations, Protestants and Roman Catholics, Saxon and Celt, to forget the difference of creed and of race, and to hallow that temple of peace which she should then found with sacrifices still holier than those by which the temples of old were hallowed—by the sacrifice of those evil passions that dishonour our common faith and prevent the union of heart and hand in defence of our common country." (The right hon. baronet as he resumed his seat was loudly cheered from all parts of the House.)—Sir V. BLAKE moved the adjournment of the debate, which was seconded by Mr. E. B. ROCHE), who complained that Sir R. Peel had perverted history in misrepresenting the arguments of Mr. O'Connell. They were agitators, and he was sorry to think that they were likely to continue so.—The motion for adjournment having been withdrawn,—Lord J. RUSSELL replied. He noticed some of the chief attacks on his motion by the leading members of the Government, and brought up Lord Stanley, who emphatically denied that in quoting, on a former occasion, the words, "the minions of Popery," he either adopted them, or applied them to Roman Catholics. Lord J. Russell then went into some particulars respecting the retirement of Lord Plunket, and other details; and when he had concluded the House went to a division, when there appeared—For the motion, 225; against it, 324. Majority, 99. The House adjourned at 4 A. M. on Saturday.

Monday.—A new writ was ordered for the county of Londonderry, in the room of R. Bateson, Esq., deceased. Mr. O'CONNELL presented petitions with 387,000 signatures, praying for a Repeal of the Union.—Mr. S. CRAWFORD called the attention of the House to various petitions setting forth the complaints and grievances of the people, particularly the allegation that the House was unfairly and corruptly constituted, and was not, in fact, a virtual representation of the entire community. A portion of his speech was directed to the subject of Ireland, and the redress of its grievances, and he moved that the consideration of the Estimates be postponed till after Easter, in order to afford due time for a comprehensive review, in committee, of our entire system of taxation, with a view to reduction. Colonel RAWDON seconded the amendment, with a few observations directed to the subject of the condition of Ireland, for which he apologised on the ground that more English than Irish members had spoken in the Irish debate.—Mr. WILLIAMS did not think that the reasons assigned for the postponement were adequate. He was not in a hurry to vote away the vast sums set down in the Estimates, more especially as the annual financial statement never made the people acquainted with the fact that between four and five millions were annually intercepted on their road to the Treasury by public departments, as the Customs, &c. He reviewed generally our system of taxation, and asked for various explanations on various items of the Estimates.—Mr. FIELDEN followed, complaining amongst other grievances, of the Income-tax, on which he entered into some detail, censuring the conduct of the Boards of Commissioners.—Mr. S. HERBERT postponed explanation on the Naval Estimates until they had gone regularly into committee.—Dr. BOWRING considered that the amendment was the assertion of a popular right and constitutional principle. The proceeding might be considered obstructive if the House were fairly constituted, but such was not the case, taking into account the fact of a large amount of discontent amongst the unrepresented masses, who saw vast sums voted away without any sufficient control. After some remarks on the Income-tax from Mr. T. DUNCOMBE, Mr. ROCHE spoke at some length on various topics of the late discussion on Ireland.—Mr. GISBORNE though approving of an investigation into the people's grievances, could not vote for a proposition for a simple postponement of the estimates till after Easter without any specific motion. On a division the amendment was rejected by 105 to 11.—Sir C. NAPIER then brought forward his annual motion for an inquiry into the constitution of the Board of Admiralty. He complained of the irregular and inefficient manner in which the business was transacted between the different departments; of the small number of naval men, whether seamen, marines, or naval civilians, selected to fill the numerous subordinate situations in the offices, dock-yards, victualling department, &c., of the Admiralty, which were usually

filled by butlers and other servants of influential individuals; and also of the want of a sufficient fund to provide a "retired list" for old officers, and thus, by the equitable promotion of younger men, enable the navy to be kept in an efficient state. He also pleaded for a proper rating of the important class of masters who at present rank in an inferior grade below the youngest and junior officers. The changes which he proposed to introduce into the Board of Admiralty were intended to effect such a subdivision of duty as would secure an efficient performance of it, from the First Lord downwards.—Mr. SYDNEY HERBERT (Secretary to the Admiralty) was favourable to the employment of naval men in the civil service of the Admiralty, and was instrumental in promoting it. But old men were inefficient, and young men as soon as they had learned their business were apt to be taken on active service, by which an inconvenient change of servants would be continually maintained. He did not see what was to be gained by a change in the Board of Admiralty; at present there was a responsible officer at the head of each department; there was a fair day's work for each, but not more than any industrious man could undertake, though he admitted that in time of war an increase might be necessary.—Captain PECHELL thought that no sufficient answer had been made to the statement of Sir C. Napier. He therefore went into various professional details in order to prove that the defect of due supervision in the building of men-of-war, the manning of the navy, &c., rendered a change necessary.—Dr. BOWRING made some observations upon the mode of keeping the accounts and making the payments of the various naval departments.—Captain PLUMRIDGE said a few words in favour of the masters. After which, Sir C. NAPIER withdrew his motion.—The House having resolved itself into committee, Mr. S. HERBERT rose to propose the Naval Estimates. As great a reduction had been effected as was consistent with the efficiency of our navy and the protection of our interests in all parts of the world. It is the intention of Government to re-establish Deptford as a building yard; schools are established for the instruction of youths in naval architecture; and various changes have been made in order to render the whole of our naval yards more effective, and maintain our ship-building superiority. After running over the different classes of items, explaining where there had been increase and where reduction, he moved a vote of 36,000 men and 2000 boys for the naval service.—Mr. WILLIAMS questioned the reason of the large number of Marines employed on shore, which was 2500 more than in 1835-38.—Sir G. COCKBURN explained that the Marine force on shore was extremely valuable, from the readiness with which they could be shipped in case of any sudden emergency of war.—Sir C. NAPIER agreed in the propriety of maintaining our navy fully manned.—Some conversation followed on professional and other points, after which the vote was agreed to, as was another, after which further progress with the Estimates was suspended, and the House resumed.—The further consideration of the Horse-racing Penalties Bill was then brought on, and Mr. C. BERKELEY proposed a clause to extend the protection of the Act to *all* games and sports.—Dr. BOWRING seconded the motion, not understanding the exclusive legislation which would protect one fashionable sport and leave others open to penal action.—Mr. J. WORTLEY saw no analogy between cock-fighting and other cruel sports and betting at horse-racing. The bill, too, merely suspended certain actions till a committee, now sitting, had reported on the gaming laws, with a view to their revision.—Mr. C. BERKELEY withdrew his amendment, and the bill passed through this stage of its progress.

Tuesday.—In answer to Mr. HINDLEY, Sir R. PEEL said that there was every reason to believe that the French Government had deliberately, and of their own voluntary feeling, disavowed the proceedings of the French admiral, Dupetit Thouars, in taking possession of Tahiti; and that, therefore, our Protestant missionaries, to whom so much was due, would be freed from all apprehensions.—Sir J. GRAHAM, in reply to Mr. BORTHWICK, said he was not prepared to make any alteration in the discretionary and responsible power now vested in the Poor-Law Commissioners, with respect to the appointment of chaplains to Poor-Law Union workhouses.—In answer to Mr. TURNER, Sir R. PEEL said that the Government had no intention of introducing any legislative measure on the subject of duelling. But the Government were practically discouraging duelling. In the melancholy case of Colonel Fawcett—a brave officer—his widow was refused the pension to which otherwise she would have been entitled, if her husband had not died in a duel; and Lieut. Munro, who had not come forward at the end of the usual time allowed him, was superseded.—Mr. T. DUNCOMBE asked if, in that case, the practice of the army in trying officers for *not* fighting duels was to be discontinued?—Sir R. PEEL begged that all discussion might be postponed till the formal introduction of a motion, of which Mr. Turner had given notice.—Mr. WALLACE brought forward a motion for reforming the Scotch Law Courts, which he prefaced with a long speech, but as he could find no hon. member to second him, the motion fell to the ground.—The SPEAKER announced that the petitioners against the return of Mr. Bright for Durham had declined to prosecute their petition.—Lord John MANNERS moved an address to the Crown, representing to her Majesty that the detention of Don Carlos and his family, in a town belonging to her Majesty's ally, the King of the French, is opposed to justice and the honour of this country, and humbly praying her Majesty to intercede with the Court of the Tuileries for their deliverance therefrom. The noble Lord quoted the declaration of Mr. Pitt, that when the justice, the honour, or the policy of this country was implicated, it was bound to interfere in cases similar to the present. He described the injustice to which in his opinion Don Carlos has been subjected by the late Government, which left the consummation of their persecutions to the Government now in office. The interference of a British Government had lost Don Carlos his crown; that interference had forced him to take refuge in France, it also deprived him of liberty; and now, after five years of a cruel and rigorous imprisonment, was it too much to ask another British Government to interfere to have him restored to his liberty?—Sir R. PEEL criticised the terms of the motion, which censured the detention of Don Carlos as being opposed to "the honour and justice," not of France, but "of this country." The French Government had formally intimated that the detention of Don Carlos originated, not in the conditions of the Quadruple Treaty, or from the representations of England, but from an exclusive view of French interests and policy. Don Carlos, though an illustrious prince, was still a refugee; and having claimed French hospitality, was amenable to the French laws applicable to refugees, of whom there were no less than 12,000 Spanish, including Cabrera, in the French dominions. We could not interfere with the free action of independent countries; were we to do so, it would afford at once a dangerous and an unlimited precedent. Looking to the distracted state of Spain, he was willing to give his own individual opinion, that the French Government, if they acted on their own established law, were quite justified in preventing Don Carlos from returning to that country and adding a new element of discord to its affairs. At the same time, he deprecated any harsh exercise of power towards an illustrious member of the House of Bourbon. But, so far from being imprisoned, Don Carlos had a range of four leagues round Bourges, and no other restraint was laid upon him than was consistent with preventing his return to Spain; he would be set at liberty if he would give an engagement that he would retire to any other part of Europe. Mr. SMYTHE spoke warmly in support of the motion, and Lord PALMERSTON vindicated briefly the policy of the late Government in Spain, which he contended was consistent with sound policy and true humanity. He concurred with Sir R. Peel in opinion as to the absurd and undignified position in which the motion would place this country, and the danger which would result from the return of Don Carlos to Spain. It was the interest of England that Spain should be independent, prosperous, and national; and her support should be given not to any faction, but to the party which was most likely to achieve these results.—Mr. B. COCHRANE stated that he had been lately at Bourges, and found Don Carlos lodged in a miserable room, his whole accommodation consisting of three apartments for himself, with a pittance of about 700*l.* a-year. And this was the treatment given to a Prince whom it had been stipulated to regard as an Infante of Spain. Wherever he went he had four gensd'armes and two agents of police to follow him, and to watch his movements; and the feeling of the Prince was, that the manner in which he was treated was sanctioned by England.—Sir C. NAPIER and Sir H. DOUGLAS opposed the motion.—Mr. BORTHWICK and Mr. M. MILNES supported it.—Mr. M. GORE suggested that, as all the practical purposes of the notice had been sufficiently served, and the cause of humanity vindicated by the expression of sentiments which the question had evoked, the Noble Mover would do well not to press it to a division.—Lord J. MANNERS acquiesced, and the motion was negatived without a division.—Capt. BERNAL moved for the copy of an address presented to the Lord Lieutenant of Ireland, from the Dublin Protestant Operative Association and Reformation Society, dated the 14th day of Oct., 1843; together with the official reply of the Lord Lieutenant, dated Vice-Regal Lodge, Oct. 16, 1843; and divided the House—For the motion, 84; against it, 105; majority, 71.—On the third reading of the Horse Racing Penalties Bill, Mr. CHRISTIE moved the third reading that day six months—For the third reading, 87; against it, 21; majority, 65.

Thursday.—Mr. V. SMITH gave notice, for the 14th inst., to move that an alteration be made in the oath taken by Roman Catholics on entering Parliament.—Mr. S. CRAWFORD gave another notice for stopping the supplies.—In reply to Mr. WALLACE, Mr. GLADSTONE stated that, in all cases where railways were brought before Parliament by Bill, in which any new powers were to be given, it was the intention of Government that those railways should be brought under the operation of the clause recommended by the railway committee, subjecting them to any general law that might be passed this session.—The Earl of LINCOLN moved for leave to bring in a Bill to regulate the construction of buildings in the metropolis and its neighbourhood. The Act now in force was passed 70 years ago, and therefore many of its provisions were inapplicable to the existing state of the metropolis. The present Bill was similar to that introduced, but not passed, last year, with the exception of the general drainage regulations; the only regulations in this Bill being that, for the future, no house should be erected without a proper provision being made to secure adequate drainage. He also proposed a clause to prohibit the carrying on of trade likely to occasion loss by fire, and also of trades dangerous to health in crowded localities.—After a complaint by Mr. T. DUNCOMBE of the dilatoriness of the Commissioners of Woods and Forests, in not rebuilding houses and streets which had been pulled down to make room for improvements, leave was given to bring in the Bill.—Mr. RICE called the attention of the House to the report of the committee on shipwrecks, with reference to harbours of refuge, and moved an address to her Majesty, praying that a commission of scientific and competent persons might be appointed to consider and advise the best means of carrying into effect the recommendation of that committee. The hon. Member recommended the port of Dover as one which could be made the very best harbour of refuge in the world.—Sir J. R. REID spoke warmly in favour of making Dover a harbour of refuge, offering to overcome any scruples of the Chancellor of the Exchequer, by raising on advantageous terms any loan that the undertaking might require.—Sir R. PEEL thought it rather odd that the two members for Dover should be so earnest on the subject. The east and the west coasts had also their claims; and a report had been made recommending three harbours, each of which would cost two millions. For himself, were he called on for an opinion, he would name Holyhead, by reason of the character of the western coast, and the importance of maintaining prompt communication with Ireland. He did not undervalue the claims of Dover; but looking to the great progress making in steam navigation, and to the vast importance of a harbour of refuge, both for offensive and defensive purposes, in time of war, the subject was deserving of serious consideration. The Government, therefore, intend to appoint a commission for its full and sufficient examination, the members of which shall be composed of the most eminent members of the profession, well acquainted with the action of tides, currents, sea deposits, &c., and all the other considerations connected with a matter of so much importance to this country, looking to the protection of its trade, the security of the country, and so forth. Some further conversation followed, and Mr. Rice having thanked Sir R. Peel for his announcement, withdrew his motion.—Sir V. BLAKE brought forward a motion for a select committee, to inquire and report how far it may be practicable, expedient, and useful, to promote a more speedy intercourse between Great Britain and America, by the establishment of steam carriages (in connection with a ship canal also to be executed) across Ireland, and thence by steam communication across the Atlantic.—Sir R. PEEL was not ready to accede to the motion, particularly as it went to commit the House to an opinion that Galway was the most eligible terminus of the railway across Ireland, an opinion at variance with those expressed by the Commissioners, who had, in their report, recommended the continuation of two great lines of railway through Ireland as the preferable means of communication. The first was the south-western, and the other the northern line; and they stated very strong reasons for preferring Cork as the terminus of the great south-western line. They said if a frequent and regular steam communication between England and the United States be established, it appears to us that Cork, as a steam-packet station or port of call, would be in every way the most convenient. The Commissioners stated also that Galway would derive its full share of advantage from the adoption of the south-western line, as the communication between that place and Dublin would be materially shortened in point of time; and further, they do not recommend any line of railway that would interfere with the traffic of the two great canals—the Grand Canal and the Royal Canal. If the proposition of the Hon. Member were entertained, the Member for Cork might reasonably ask for a special inquiry on behalf of that city, and the Member for Waterford might come forward and demand a special committee to investigate the peculiar advantages which the place he represented offered as the point of communication. With regard to the interference of the Government in the formation of these proposed lines of railway, he had that day had an interview with a deputation of gentlemen, who were disposed to construct a railway which would form a south-western line of communication in Ireland, and of which Galway would have its share of advantage, and these gentlemen had informed him that if they had been in time to have served the notices, according to the standing orders, in November last year, they would have been enabled to raise the necessary deposits and capital to complete the line of railway communication between Dublin and Cashel. He therefore considered that there was no necessity whatever for Government interference, for it was evident that there were persons in the field ready to undertake the line as a matter of private enterprise and speculation.—Mr. Sergeant MURPHY expressed his gratification at ascertaining from the deputation to which the right hon. baronet had alluded, that there was every probability of the line of railway between Dublin and Cashel being speedily carried out; and the statement of Sir R. Peel would have, he was convinced, very great influence in carrying out the proposed enterprise.—Sir V. BLAKE in reply contended that Galway was the best terminus, and therefore he had proposed the committee. He would however adopt the right honourable baronet's suggestion, and withdraw the motion.—The motion was then withdrawn.—A motion by Mr. WALLACE respecting railways having been postponed at the request of Mr. Gladstone, Colonel RAWDON brought on the following motion:—"That it is the opinion of this House, upon considering the lateness of the period at which was issued the proclamation of the Irish Government, intended to prevent the assembling of a meeting announced to be holden at or near Clontarf on the 8th day of October, 1843, that a risk of disastrous collision was incurred, and a precedent thereby created dangerous to the lives and liberties of her Majesty's subjects." He went largely into detail, derived from the information of individuals, in order to show the inconvenience, alarm, and danger which the lateness of the prohibition had caused, and the consequences of which were only obviated by the exertions of Mr. O'Connell, and the peaceable disposition of the people, who however were determined on obtaining equal justice.—Mr. V. STUART seconded the motion, commenting on the tardiness of the issue of the proclamation, and the nature of the indictment against the traversers. He also expressed an opinion adverse to the maintenance of the Vice-royalty, seeing that it was made a rallying point of party, according as the Lord Lieutenant was Whig or Tory. He would rather apply the Vice-regal establishment to some useful Irish object.—Lord ELIOT recapitulated those topics of Government defence with which the public have been made familiar during the late Irish debate. The prohibition of the Clontarf meeting was founded on the peculiarity that it was distinguished from all others by its unequivocal illegality; and though he was alone in Dublin at the time, he had made up his mind to prohibit it, even if there had been no time to receive instructions from the Government in England. The proclamation had not been decided on till after mid-day on the Saturday, and necessary delay arose in its transcription and printing. But it was extensively posted in Dublin and its neighbourhood during the afternoon, and the strong military force at the disposal of the Government, and which occupied the ground at Clontarf early on the Sunday morning, prevented even the possibility of an outbreak. To have suffered the Clontarf meeting, would have sanctioned the defiance of all law and authority; and there was no blame to be attached to the Government, which had fearlessly and humanely discharged its duty.—Mr. SOMERS, Mr. S. CRAWFORD, and Mr. E. B. ROCHE supported the motion. The latter remarked that it was the misfortune of every party to be burdened with brainless blockheads, whom nothing can control, and one of these was the author of that "repeal cavalry" notification, on which the Government grounded their determination to interfere with the Clontarf meeting.—On a division there appeared, ayes, 62; noes, 90; Majority 28.—Lord WORSLEY moved for leave to bring in a Bill to facilitate the inclosure and improvement of commons and lands held in common. It was his opinion that if the management of the waste lands were placed under a board properly constituted, the result would be, that in many places where there was now great difficulty in finding employment for the poor, there would be, in the course of eight or ten years, a large number of persons employed in draining the land and inclosing it; that additional encouragement would be given to the poor to cultivate the land, to say nothing of the increased produce they might expect to obtain from it. He was connected with a county in which agricultural improvements had been carried into effect to a very great extent. Looking to the state in which that county now was, and its condition thirty years ago, and to the facilities which modern science placed in their hands for further improvements, he did not despair of seeing a very large portion of England, which was capable of being cultivated, brought into a high state of tillage, and that, be it remembered, by employing persons who were now lamentably in want of employment. He had obtained much information from persons well acquainted with the great changes which had taken place in the course of the last generation in the agriculture of this country, and had received communications from persons well entitled to be considered as authorities on this subject, which all tended to confirm his views. It might be said, Why do not parties now come to Parliament for power to inclose lands capable of improvement? The answer was, that the expense of passing an act for that purpose through the House was so great as very generally to deter them from doing so; and he believed that this was the reason why parties did not oftener apply for inclosure bills. What he wished to propose was, that commissioners should be appointed as inclosure commissioners, and that some such plan should be adopted, as that if two-thirds of the parties interested in the land, either as common land or land in common, should wish to have it inclosed, there should be a meeting called, and that then they should make an application to the commissioners, who would send down assistant commissioners, who would take into consideration not only the interests of the parties, but the locality and the general advantages to be derived from the inclosure. Then if they should be of opinion that it would be advantageous to have the inclosure, they would so report to the commissioners. A day would then be appointed for hearing the claims, and after award should have been given upon them, a certain notice should be given to enable the parties to object. Then if one-fourth of the parties objected to the inclosure being proceeded with, they should petition the House of Commons, and give notice to the commissioners not to proceed until six weeks after the meeting of Parliament, or after the date of the notice. He thought that plan would prevent all hardship upon the parties, by giving power to that House to adopt the inclosure if they thought it right, and if not it would prevent great expense and loss. He assured the House that he had endeavoured to form the bill with a strict regard to the rights of the poor, also considering well whether it would be advantageous to the parties to whom the property belonged, as likewise to the population of the surrounding districts; and he hoped the House would allow him to bring in the measure. Much evil had arisen from local acts not having in some instances been fully carried out, and in others unfairly, the consequence of which was, that many persons holding common lands, but really having no title, had been put to great inconvenience in the sale or transfer. He proposed, then, that instead of putting them to the expense of applying to Parliament for powers, an application to the commissioners should be sufficient. Some hon. members were anxious that provision should be made for allotments to the poor; and he conceived that a general inclosure measure was so much wanted, and would be of so much benefit to the country, that if a majority of the House should be of opinion such a clause ought to be added, he would not abandon the bill on that account, although he might not approve such an addition. The noble lord concluded by moving a "Bill to facilitate the inclosure and improvement of commons and lands held in common; the exchange of lands, and the division of intermixed lands; to provide remedies for the defective or incomplete executions, and for the non-execution of the powers of general and local inclosure acts, and to provide for the revival of such powers in certain cases."—Colonel SIBTHORP, giving every credit to Lord Worsley for his desire to uphold the landed interest, was so alarmed by all the innovations on foot, from the Reform Bill to railroads, that he could not permit this bill of 140 clauses to come into the House. He was jealous of the host of commissioners which the Bill proposed to create, of the expense of working its machinery, and so forth; and he was determined to try the "sense of the House" by a division.—Lord J. MANNERS should support the Bill in this first stage, and at any future stage he should be anxious to insert such provisions as would increase those rights of the poor, which if not legal, were at least equitable.—Mr. S. CRAWFORD opposed, Mr. BRIGHT, Mr. TRELAWNEY, and Sir C. BURRELL supported the Bill.—Colonel SIBTHORP withdrew his amendment, and leave was given to Lord Worsley to bring in his Bill.—The LORD-ADVOCATE obtained leave to bring in a Bill to amend the law with respect to prisoners and prison discipline in Scotland.

Friday.—Sir W. HEATHCOTE moved the second reading of the Salisbury Branch Railway Bill.—Mr. B. WALL said he should not object to the second reading, but if material alterations were not made in committee, he should oppose the Bill on its third reading.—After a few words from Sir W. HEATHCOTE the Bill was read a second time and ordered to be committed.—The York and Scarborough Railway Bill, and the Severn Navigation

Bill were also read a second time and ordered to be committed.—Mr. SCANDISH presented a petition, praying for leave to bring in a bill to make a railway from Harrow-on-the-Hill to go round the Metropolis, but after a desultory conversation it was ordered to lie on the table, not being referred to the Railway Committee.—Mr. S. HERBERT moved the order of the day for the House resolving itself into a Committee of Supply. On the question being put from the chair, Mr. T. DUNCOMBE brought forward the following motion:—"A return of all moneys paid to Richard Bond Hughes, Charles Ross, and John Jackson, on account of any communications made by them to Government relative to the repeal agitation in Ireland, distinguishing the amounts paid to each; also the dates of the several payments, specifying the respective periods at which they commenced; together with copies of any instructions given to the above-named R. Bond Hughes, Charles Ross, and John Jackson, with respect to the duties to be performed by them in Ireland. Also a return of the amount paid to the above-named for expenses during their attendance at the trial of the Queen against O'Connell and others. Also a return of all moneys paid to the late or present proprietor or proprietors, managers, conductors, or persons in the employ, of the *Morning Herald* and *Standard* newspapers, or any of them, on account of communications or information made or given by the said parties, or any of them, to the Government, in reference to the Repeal agitation in Ireland; distinguishing the times at which the said communications or informations were furnished, and the period at which the several sums of money were paid. Also the name or names of the short-hand writers appointed to furnish the Government report of the proceedings at the trial of the Queen against O'Connell and others." As a Member of that House, before he consented to vote any further supplies, he felt justified in calling upon the Government to account in what manner they had expended the money already voted. He had placed a motion on the paper relating to the State Trials in Ireland, a prosecution which he considered had not been creditable either to the judges, counsel, jury, or any party concerned. He considered the Government had been tampering with the press and those connected with it, which was highly discreditable. He wished to call the attention of the House to the conduct of the administration relating to the instructions given to the short-hand writers and reporters of the press during and previous to the late trial. He considered the House was entitled to know what instructions had been given.—Mr. WALLACE seconded the motion.—Sir J. GRAHAM said, under all the circumstances of the case, he did not consider it his duty absolutely and entirely to oppose the motion. He should not re-open a discussion on the late trials in Ireland, which had occupied nine nights already, which with other motions had occupied nearly the whole of the public time, and prevented her Majesty's Government from fixing any particular period for proceeding with important measures. He at once avowed that in the early part of last year, in consequence of tumultuous meetings, great excitement prevailed in Ireland, and therefore he considered it necessary to obtain the most authentic intelligence he could obtain on the subject by means of short-hand writers, which he believed was the usual course. Whatever had been done was done solely on his own responsibility, and he did not wish to shrink from the responsibility. With respect to Mr. Bond Hughes, he was engaged through Mr. Gurney on the usual terms of a short-hand writer, and he had no objection to lay before the House a copy of the instructions given to Mr. Hughes and money paid to that gentleman. He wished the return to be before the House. With respect to Mr. Ross, he would tell the House what happened. The Government first sent a short-hand writer to Ireland in June last. He knew Mr. Ross for several years, and being aware that he was an able short hand writer, he was engaged to go to Dublin, for which he was to have 35*l*. If it is said that Mr. Ross was sent as a spy he totally and boldly denied it. He was aware afterwards that Mr. Ross was connected with the *Morning Chronicle* and *Standard* newspapers, but his instructions from the Government were to take full and correct notes of what he heard, so as to be able to verify them, if necessary, in a court of justice. He admitted that application had been made to the *Morning Herald* and to the *Standard*, to allow the statements which had appeared in their columns to be verified by their correspondents. He avowed that such an application had been made by the Crown Solicitor; but if it was alleged that any money had been passed to the proprietors of those journals, as a gentleman and a man of honour he solemnly denied it. He should not oppose the return, as related to instructions given and money paid to the short-hand writers named in the motion; but he could not consent to that part of the motion relating to the proprietors of the *Morning Herald* and the *Standard*. He thought the hon. Member would act wisely in withdrawing that motion.—Lord J. RUSSELL said he thought, if he saw reports in the newspapers of dangerous meetings taking place in the country, and if in the Government, he should be neglecting his duty did he not send competent persons to furnish him with an account of what took place; but the persons so sent ought not to mix in private with the parties whose actions they were instructed to watch; all they had to do was to take down accurately what passed in public.—After some further remarks, Mr. T. DUNCOMBE replied, and the House divided, when there appeared—For the motion, 73; against it, 144; majority against the motion, 71.

CITY.

Money Market, Friday. — Consols closed at 97½; Three per Cents. Red., 98¼; Three-and-Half per Cents. Red., 103⅛; New Three-and-Half per Cents., 102⅛; India Stock, 279; Bank Stock, 195½; Exchequer Bills, 69*s.* to 71*s.* prem.

Metropolis and its Vicinity.

Central Agricultural Society.—A meeting of the committee of the Central Agricultural Protection Society, which was very numerously attended, was held on Tuesday at the residence of the Duke of Richmond. Rules and regulations for the active progress of the society were unanimously adopted, and sub-committees appointed for the purpose of arranging all matters of detail preparatory to their being submitted for the consideration of the general committee at the next meeting, after which they will be made public.

University College.—On Wednesday the annual general meeting of the Council and Proprietors of University College took place in the theatre of the institution, for the purpose of receiving the report on the state of the College for the past year, and to elect officers for the year ensuing. The Earl of Auckland presided. The report stated that the number of pupils in the College and Junior School, during the session 1842-43, was 900. In the Faculty of Arts and Laws there were 196 students, of whom 9 attended exclusively the law classes, and 38 were entered only to the classes for schoolmasters of the Patriot Endowment Fund. The students of the Faculty of Medicine amounted to 324, and the pupils of the Junior School to 380. The amount of receipts from students and pupils was 14,106*l.* 16*s.* 10*d.*; of this sum 7291*l.* 13*s.* 4*d.* was derived from the students of the Medical Faculty, 2399*l.* 10*s.* from those of the Faculty of Arts and Laws, and 4415*l.* 13*s.* 6*d.* from the Junior School. The sum of 2875*l.* 3*s.*, derived from payments by students, was transferred to the Hospital Committee, towards the maintenance of that establishment. On the subject of Professorships, it was announced that the Council, being satisfied that the appointment of a special Professor of Clinical Medicine had been attended with success, and that the discontinuance of it would be disadvantageous to the Hospital and Medical School, determined on maintaining it, and Dr. Taylor still fills that chair; that Mr. Cooper having resigned the office of Surgeon to the Hospital, received the appointment of Consulting Surgeon; and the duties of Acting Surgeon devolved on Professor Quain; that Mr. Vignolles had accepted the office of Professor of Civil Engineering for two years more; and Mr. Webster was permanently appointed to the chair of Geology; that Professor Brooke had resigned the Professorship of Natural Philosophy; that the studies of that class were conducted under a temporary arrangement, in which he took part; and that steps are taking to fill up the vacant Professorship before the commencement of the next session. That the Professorship of Jurisprudence has been resigned by Mr. Graves; and Mr. Hargreave, formerly a student of this college, and who, on taking his degree in law, obtained the University Law Scholarship for examination in jurisprudence, has been selected to fill the chair. Under the head of Students, the council reported that the Flaherty Mathematical Scholarship was obtained by Mr. George Jessel, at the examination in January last, and expressed their gratification that the credit of the college has been well maintained at the examination of the University during the past year, as well as on former occasions. The Calendar, lately published for the first time, under the authority of the senate of the University, was referred to, and from this it was stated that the number of colleges and schools in the United Kingdom, recognised as connected with the University, are 22 of the Faculty of Arts, and 55 of the Faculty of Medicine. Of the Faculty of Arts, 18 are in England, one in Wales, and three in Ireland; of the Medical Schools, 30 are English, 19 Irish, and six Scotch. The number of degrees conferred by the University had amounted to 218 in five years. Of these degrees:—one is doctor of law, 19 are doctors of medicine and masters of arts, 16 bachelors of law, 41 bachelors of medicine, and 122 bachelors of arts. Eighteen scholarships and 22 exhibitions have been conferred as rewards on graduates for proficiency at examinations. These have amounted in value to 3570*l.*; and 16 of the scholarships and 17 of the exhibitions, the money being 2980*l.*, have been obtained by the students of this college; upon whom also 38 out of 55 gold medals, and all the scholarships that had been awarded by the University for proficiency, at the degree examinations in mathematics and classics, and in law and jurisprudence, and three of the five book prizes for the voluntary scriptural examinations have been obtained by students of this college. The amicable suit in Chancery relative to the reversionary bequest of 10,000*l.* East India Stock, by the will of Mr. Bacon, has been brought to a satisfactory termination; and in pursuance of the decree pronounced by the Vice-Chancellor, the fund of 10,000*l.* East India Stock has been transferred into the name of the accountant-general of the Court of Chancery, in trust for this college after the death of Mrs. Bacon. The negotiations with the partners of the late Mr. Brundrett for settling the amount to be received by the college and hospital, in respect of the bequest of his residuary personal estate, has been recently concluded; and it has been arranged that the residuary personal estate passing to the college and hospital, with the interest thereon up to the 4th August last, should be settled at 21,000*l.*, payable by instalments in four years, of which the sum of 5000*l.* had been already paid. The report concluded by acknowledging the gift of 675 volumes and 375 pamphlets to the library of the college, and amongst the contributors ranked the names of the Lord-Lieutenant of Ireland, and other noblemen, and a further donation of 500*l.* contributed by "a Patriot" through Lord Brougham, making the total amount from the same unknown source 3500*l.* The balance-sheet exhibited the entire receipts for the past year to be 22,354*l.* 18*s.* 5*d.*, and the expenditure 21,809*l.* 15*s.* 8*d.*, leaving a balance in hand of 555*l.* 2*s.* 9*d.* Mr. R. Taylor moved the adoption of the report, which was seconded by Mr. Bishop, and carried unanimously. Colonel Leicester Stanhope then proposed similar resolutions to those he had submitted at the last annual meeting, "calling upon the council to appoint a person to read prayers and the Scripture in the college, without comment or the aid of any particular creed or formula; that the students be invited, but not compelled, to attend; and that there being but 154 students in the Faculty of Arts, proving that the institution had failed to realise the sanguine expectations of its founders, it be recommended to the council to make it a family as well as a daily school." Considerable argument arose as to the reception of such resolutions. Mr. R. Taylor, Mr. Warburton, and other gentlemen spoke against them, and they ultimately fell to the ground for want of a seconder. The result of the ballot was then announced to be as follows:—Lord Brougham re-elected president; the Earl of Auckland vice president; and John Taylor, Esq., F.R.S., treasurer. Members of the council:—Matthew Clerk, Esq.; W. D. Christie, Esq., M.P.; Earl Fortescue; James Heywood, Esq.; Samuel Jones Lloyd, Esq.; and Thos. Thornely, Esq., M.P.; and Thomas Alers Hankey, Esq., auditor.

Education of the Females of India.—A meeting took place on Tuesday in Exeter Hall, for the purpose of promoting education amongst the native females of India. The chair was taken by the Rev. Dr. Wilson of the Church of Scotland Missionary Society. Major Jervis of the Bombay Engineers, the Rev. Mr. Schwartz, and others, addressed the meeting, and showed the degraded condition of the native women of India, and the necessity of elevating them from it by means of moral and religious instruction. Hindoo husbands, the speakers stated, objected to educated women, because it would increase their evil desires, which the sacred Sanscrit writings said were eight-fold greater than those of man. Females in the Presidency of Bombay were married at the ages of four, five, and six years. The ignorance of the Hindoo wife was so great that she looked upon her husband as a god, and drank, as a means of purifying herself, the water in which she had washed his feet. Women in some of the States were still immolated on the funeral pyres of their defunct husbands, and no widow was allowed to remarry, because such permission was considered an inducement to the poisoning of husbands and betrayal of their family secrets. A widow was obliged to keep her head always shaved, to abstain from the use of aromatics, eat only one meal a day, and never lie down on a couch. Notwithstanding the many objections on the part of the Hindoos to the education of their females, the missionaries, after three months' residence in Bombay, obtained 53 native female scholars; in six months, 120; the next year, 175; in 1832, 200; in 1841, 519; and last year, 600. The Scriptures and catechism were taught them, besides various accomplishments appropriate to the female sex. The majority of girls were at first obtained from amongst the humbler classes, who are more ready to receive instruction than the upper classes, but the latter seeing the advantages their poorer neighbours were reaping, resolved not to be behind-hand, and sent their girls to the schools. The native male students of the Missionary and Government Colleges were now favourable to female education. The ladies of Scotland had resolved to aid the missionaries, and had sent out to Calcutta, and were about to send to Madras, a European female agent. After the statements of the different speakers, measures were agreed to in furtherance of the object of the meeting, and a collection made for its support.

Anti-Corn-Law League.—The weekly meeting of the League was held on Wednesday in Covent Garden Theatre, the day of meeting having been altered from Thursday to Wednesday. Mr. G. Wilson presided, supported by the Hon. C. P. Villiers, Sir V. Blake, Mr. Cobden, &c., and the meeting was addressed by the chairman, Mr. H. Ashworth, Mr. Milner Gibson, and Mr. Bright.

East India House.—On Wednesday a special Court of the Proprietors of East India Stock was convened by the Court of Directors for the purpose of laying before the meeting resolutions of thanks adopted by the Directors in reference to the recent military operations in Scinde. After some discussion, the vote of thanks to Sir C. Napier for his military conduct in the late operations in Scinde, was carried by a large majority, only four hands being held up against it. Similar votes of thanks to the officers and men were carried unanimously.

Free Church of Scotland.—On Friday evening the new deputation from the Free Church, consisting of the Rev. Dr. Forbes, the Rev. A. Beith, and Mr. Lyon, a layman, held their first public meeting at the Scotch Church, Regent-square, Mr. P. M. Stewart M.P. in the chair. The members of the deputation severally addressed the meeting, but gave no additional information on the present state of the seceding Church, the chief topics being the Veto Law, Lord Aberdeen's Bill, and the claims of the Church to spiritual independence. There are, it appeared, at the present moment 200 young men in the Hall of Edinburgh, preparing for the Ministry in connection with the Free Church, studying divinity under Dr. Chalmers. In the University of Glasgow four classes for the study of Theology had been formed. Several addresses were delivered, and on Sunday sermons were preached at several chapels belonging to various denominations on behalf of the Free Church.

The Wilkie Statue.—The following inscription proposed by Lord Mahon, is to be placed upon the statue to Sir David Wilkie, in the vestibule of the National Gallery —"Sir David Wilkie, R.A., born 1785, died 1st June, 1841—a life too short for friendship, not for fame."

The Wills' Forgeries.—The daily papers state that Mrs. Dorey, one of the parties charged with being an active agent in these forgeries, has made a full confession; and that the document is in the hands of the authorities. It is also said that the Directors of the Bank of England are taking extraordinary precautions to prevent the repetition of such forgeries as those which have of late occupied public attention. They intend, it is said, to write to every stockholder, to ascertain whether he be the real owner of the stock represented in the power of attorney, at the same time asking him whether he has consented to sell it.

Cleansing the Streets.—A meeting was held on Friday at the Hanover-square Rooms to take into consideration proposals for the employment of the able-bodied poor in cleaning the streets of the metropolis on the same plan as that lately adopted for preventing the formation of mud and dust on the wood-paving in Oxford-street and Regent-street. Mr. B. B. Cabbell was requested to take the chair. A report was read detailing the advantages of the proposed plan, which stated that the means hitherto used in the localities already referred to have been manual labour, combined with Whitworth's street-sweeping machine; that from 40 to 50 men and boys have been employed during the day in the removal of excrementitious matter, by which 24 loads of manure were obtained per week; that the experiment of cleansing the streets by washing the dirt down the sewers has been tried and found successful; that experience has enabled the committee to reduce the future

expenses to the amount of 1*s.* 7*d.* a week for each house, which sum would include all the necessary watering, thereby saving the present rate of about 5*d.* a house per week, which reduces the extra expense to only 1*s.* 2*d.* a house per week. The committee, which consists of 18 of the inhabitants of Oxford-street, Regent-street, &c., after adverting to the improvement now apparent in the appearance of those two streets, trust that such general measures may be taken throughout the metropolis as may not only secure to the inhabitants clean streets and pavements, but afford employment on fair and liberal terms to the vast bodies of destitute able-bodied paupers who are now either compelled to wander in quest of support or become the inmates of a union workhouse. Lord Ranelagh said this was a most important subject, and one on which there ought not to be two opinions. In the first place, if carried out, it would find increased employment for a vast number of the poor, desiring and seeking an honest means of obtaining their daily bread; it would bring additional comfort to the middle classes, and it would afford an extra luxury to the opulent. The decent pedestrian, and the rich owner of an equipage, would both be benefited. The shopkeeper asked for it as the greatest of boons, and the private inhabitants of the houses of populous thoroughfares prayed for it as one of the first things to be desired. Several speeches were afterwards delivered, and resolutions passed in favour of the principles embodied in the report.

Institute of the Fine Arts.—At a general meeting of this society on Saturday, Thomas Wyse, Esq., M.P. in the chair, a petition to Parliament for the establishment of a hall of sculpture was read and agreed to. Its objects were that casts of all the most eminent statues in the world be placed in a building established for the purpose, to be opened to the public during the day, and to artists and patrons of art in the evening, properly lighted for study; that the casts should be fresh casts, not casts from recasts, which, it is imagined, the British Government would readily obtain in exchange for casts of the Elgin marbles; and these new casts would enable the Government to supply the various schools of design at a cheap rate, &c.

Richmond.—Two robberies, one of them very extensive in its character, occurred on Sunday evening last, at Richmond. It appears that it has become a practice with the London thieves to leave town in small parties on the Sunday morning and disperse themselves through the different villages. They generally take some refreshment at an inn in the neighbourhood they intend to "work" in, and by dint of inquiry and observation, ascertain what families are out or likely to be out, for any portion of the evening, and whether the servants are permitted to go to church or elsewhere during the absence of the family. It generally happens that they discover one or two of the villas left unguarded, and these as soon as it is dark they enter without making any breakage or disturbance, being always provided with a selection of skeleton keys. Sometimes a finely-finished crowbar, an instrument not more than six inches long, but possessing extraordinary lever power, is brought into requisition, and as no box, drawer, or cupboard can withstand it, the thieves select the most valuable and portable booty and decamp. Everything is managed so quietly, and with so much adroitness, that it is almost impossible for a policeman on his beat to detect their presence in a house. Both the robberies alluded to took place in St. John's-grove, between six and nine in the evening. From the house occupied by Mr. Sanderson four 10*l.* notes, 19 sovereigns, and a quantity of plate and jewellery to the amount of nearly 100*l.* in value was stolen. From Mr. Blake's, a neighbouring house, were carried off a silver watch and other articles of jewellery.

Peckham.—An instance of the changes to which persons who have moved high in commercial credit and worldly comfort are frequently subjected has occurred in the case of Mr. Robson, the projector and publisher of the "Post Office Directory" which bore his name. This gentleman after suffering the loss of his fortune sank into poverty, until he was compelled to seek parochial aid, and at length died on Tuesday in Peckham workhouse, of which he had been for a considerable time an inmate.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending Feb. 17.—West Districts, 164; Northern, 206; Central, 209; Eastern, 270; Southern, 297. Total, 1146. Weekly average for the last five years, 946.

Provincial News.

Agricultural Meetings.—The following meetings in favour of protection and for the adoption of measures to oppose the League have been reported since our last.—On Thursday the 22d, at York, the Earl of Harewood in the chair, supported by the Earl of Tyrconnell, Lords Feversham and Beaumont, Sir R. F. Russell, Bart., R. Bethell, Esq., M.P., H. S. Thompson, Esq., Godfrey Wentworth, Esq., H. Willoughby, Esq., the Hon. E. Lascelles, and about 1000 agriculturists. Upwards of 2000*l.* was subscribed at the meeting.—On Friday at Ely, Mr. Layton in the chair, supported by a large number of tenant-farmers. About 500*l.* was subscribed in the room.—On Thursday at Epping, Mr. Baker of Writtle, in the chair, supported by most of the tenant-farmers of the western division of Essex.—On Wednesday at Kingsbridge, Mr. Helmore of Shilston, in the chair, supported by a large number of landowners, farmers, and others, connected with the agriculture of the South Hams.—At Sherborne, Mr. T. Ensor in the chair, supported by Sir W. C. Medlicott, Bart., Sir H. Willoughby, Bart., Rev. Dr. Lyon, &c.—At Guildford, on Thursday, Mr. Holland in the chair, supported by Mr. Trotter, M.P., Mr. Mangles, M.P., Messrs. C. Barclay, H. Drummond, H. Currie, Colonel Delap, the Mayor of Guildford, Colonel Holme Sumner, Mr. M. Molyneux, Mr. H. T. Hope, &c.—On Monday at Welshpool, Montgomeryshire, J. Owen, Esq., High Sheriff, in the chair, supported by the Earl of Powis, David Pugh, Esq., Martin Williams, Esq., Bonner Maurice, Esq., John Turner, Esq., the Rev. Mostyn Pryce, and a large number of tenant-farmers.—At Uxbridge on Thursday, Mr. James Tillyer, a tenant farmer, in the chair, supported by Mr. Newdegate, M.P., Col. Wood, M.P., Mr. Dupre, M.P., Mr. Pownall, Sir John Gibbons, Rev. W. Hewson, Col. Vyse, and about 500 farmers.—At Harleston on Wednesday, Mr. Etheridge, a tenant farmer in the chair, supported by a large number of the agriculturists of Norfolk.

On Monday a meeting called by the Anti-Corn-law League was held at Thirsk in the North Riding of Yorkshire, for the purpose of hearing addresses from a deputation of the League, consisting of Colonel Thompson, Mr. Prentice, of Manchester, and Mr. Plint of Leeds, on the expediency of free trade in Corn. The meeting was attended by a large number of landowners and farmers of Thirsk and neighbourhood. Addresses were delivered by the deputation in favour of free-trade principles, which were opposed by Mr. Crompton of Sion-hill, and Mr. Rutson of Newby Wiske. At the conclusion Mr. Crompton proposed a resolution to the following effect:—"That a free trade in Corn would reduce to a state of destitution all who had invested their capital in farming operations, materially injure the landowners of Thirsk, bring want and misery on the agricultural labourer, and involve in one common ruin all classes of the community." The resolution was carried by a large majority.—On Friday and on Saturday Anti-Corn-law meetings were held at Gloucester, the first being the city meeting, the second the county meeting. At the first Mr. S. Bowly presided; and Mr. Cobden, Mr. Moore, and Col. Thomson addressed the meeting as a deputation from the League, after which resolutions in favour of free trade were carried. At the county meeting on Saturday, Earl Ducie presided. Mr. Cobden spoke at some length, after which a resolution in favour of free trade was moved, upon which Mr. Clark, a farmer, moved an amendment in favour of protection; but on a show of hands the free trade motion was adopted by a large majority. A vote of confidence in the League and thanks to Earl Ducie for his efforts in behalf of free trade were then carried.

Bath.—On Tuesday week, after a sharp run of the Badminton hounds, the fox took refuge in a farmyard. The Duke of Beaufort was quietly watching his seizure, when his horse suddenly took fright and reared so high, that his Grace being off his guard could not keep his seat, and fell to the ground on the keys of the park-gate, which he carried at his side. His Grace, however, rode home, and went hunting the next day; but a pain in the side from time to time indicated that some mischief had been done, and a surgeon having been sent for from Bath, he declared that his Grace had broken one of his ribs, and ascribed the injury to the pressure of the keys when he fell. His Grace however is doing well, and is not likely to experience more than temporary inconvenience from the accident.

Brighton.—At the East Sussex adjourned Sessions on Friday, a corporal and five privates of the 7th Hussars, at present stationed in this town, were indicted for a riot and assault on the 31st January last. It appeared by the evidence that a large party of soldiers had assembled in Thomas-street, Brighton, and attacked two houses rented by a Genoese named Lourieno, who let out the rooms to itinerant Italian musicians. The windows and furniture were broken to pieces, including several organs and pianos, and Lourieno in endeavouring to protect his property had his arm broken. The two houses were left perfect wrecks. The affray arose through a violent assault being committed by some person residing in one of the houses on a private in the 7th Hussars, and his comrades committed the outrage to avenge the insult. The Jury found all the prisoners guilty except one, and the court sentenced them to imprisonment and hard labour in the House of Correction for ten months.

Chichester.—A new window has just been put up in the cathedral, the expense of which has been defrayed by subscription. The three ancient quatrefoils in the central light are occupied by designs representing the appearance of the Burning Bush to Moses, the Baptism of Christ, and the Descent of the Holy Spirit on the day of Pentecost. The Resurrection occupies the northern side light, and the Ascension the southern. Emblems of the four Evangelists are placed in the upper and lower parts of the side lights.

Hull.—A few days ago, says the *Hull Rockingham*, "a person in this town, carrying on an extensive business, hit upon the following plan for raising the wind:—He held a Bank-note for 50*l.*, which he cut in two, and taking one of the portions to an acquaintance, informed him that he had just received it by post, the other portion being to follow in the course of a day or two; but as he wanted the money immediately, he could not wait for its arrival. This friend in need, on receiving the half note, advanced the cash; and another friend did the same on receiving the other half. Here were a hundred pounds made out of fifty, but the business was not yet completed. Taking his hundred pounds to one of the banks, he procured a note for that amount, and having again recourse to the process of cutting, actually obtained 200*l.* on the two halves, with which he decamped, and has not yet been heard of."

Manchester.—The committee appointed at the annual meeting in October last to investigate the affairs of the Bank of Manchester have presented their report to the proprietors. They state that having exercised the utmost discretion in the estimates placed on the value of the assets, whether in the form of real securities or personal obligations, they have arrived at so near an approximation to the statements contained in the report as to justify them in pronouncing the balance-sheet exhibited to the shareholders on the 20th October, 1843, to have been (as far as could be ascertained) a true and accurate statement of the position of the bank on the 30th of June in that year. The committee have also examined the balance-sheet for the half-year ending the 31st December, 1843, and report that this balance-sheet shows a considerable realisation of assets, and consequent reduction of liabilities, from 440,936*l.* to 314,778*l.*, during the half-year, and justifies the hope that no further loss will result to the shareholders than will be provided for by the payment of the second call.—On Monday afternoon the inhabitants of Port-street, Manchester, were alarmed by a noise proceeding from an iron warehouse, one of the most extensive in the town, and occupied by Messrs. Horton, Simms, and Bull, proprietors of the Swades-hill iron-works, Shropshire. It appears that some men were in a large shed, the roof of which is supported by ten iron pillars against each of which large quantities of iron were piled. The men were engaged in "sorting" the iron and rearing it up against the pillars, when in an instant and without the least notice one of the piles of iron so laid up against the pillar gave way, and falling in a direction towards the next pillar came in contact with and carried it away; the second pillar also gave way, and in the same manner carried off the third, and so on until the whole of the five pillars went in succession, and ultimately came in contact with the gable end of the shed and drove the whole end of the building, roof and all, into the canal, which runs close to the warehouse. A woman was standing on the opposite bank of the canal with a child in her arms; a large portion of the falling building threw her down and dashed the child out of her arms into the canal; on being extricated from the ruins it was found that her thigh was broken, but the child was got out of the water unhurt. A gentleman who had just entered the warehouse to purchase some iron, and a person named Wilkinson who was in the employ of the company, were buried in the ruins and killed. There were five other persons in the shed at the time, most of whom received more or less injury. The navigation of the Rochdale and Manchester canal is for the present stopped by the rubbish. The amount of damage will not exceed 1000*l.*

Oxford.—On Tuesday morning a fire broke out in the house and shop of Mr. Aaron Jacobs, a Jewish Rabbi, who kept a general warehouse in St. Ebb's-street, in this city. Six persons slept in the house—Mr. Jacobs, his wife, a son, three daughters, and two lodgers. Out of these, four escaped in a state of nudity. Mr. Jacobs assisted his wife, son, and two younger children to escape out of a window, and they were caught as they alighted, without injury. Mr. Jacobs, however, and his eldest daughter perished in the flames. He was reputed a wealthy man; and from the situation in which he was found (a small closet in the top of the house), it is presumed that he had gone there to secure his property, and was suffocated before he could make his escape. What adds force to this conjecture is the fact, that a heap of gold and silver coin, with other valuables, were discovered under the body when found.

Pontefract.—Mr. Monckton Milnes has received a remonstrance from the electors of Pontefract, in which they dissent from the sentiments expressed in his late speech having reference to the measures to be taken for the benefit of the Roman Catholic population in Ireland, and express their unalterable determination to maintain unimpaired the Protestant character of the Government, and to prevent the nation from becoming responsible for the errors of the Roman Catholic religion, by contributing to the support of its priesthood. This protest has been signed by nearly all the most influential friends of Mr. Milnes in the borough, including the mayor, clergy, all the magistrates who supported Mr. Milnes at the last election, excepting one, and all the members of the town council who voted for him on the same occasion. Mr. Milnes has published a reply to this remonstrance, in which he declares that his object and that of his constituents are the same—the preservation of the Protestant Church in Ireland; the only difference between them being as to the means. He says, "There is now formed in the House of Commons a considerable party of able men, banded together to destroy the Protestant Church of Ireland. They will be assisted out of doors by a considerable body of Dissenters, who are opposed to all establishments, and in Ireland by 2000 Roman Catholic priests, who, under the present voluntary system, owe their daily bread to political agitation. I own I cannot view such a confederacy without alarm. It will be able at the least to keep Ireland on the brink of a rebellion, to inflict on England the expense of an immense military force, and to cause much anxiety in our relations with foreign countries. The only hope of meeting this evil seems to me to rest on the improvement of the tone of feeling of the Roman Catholic clergy in Ireland. We cannot diminish their power—the penal laws themselves have failed to do that; but we may possibly divert it from its destructive course. We cannot alter what we believe to be an erroneous religion—the zeal and piety of Irish Protestantism has failed to do that; but we may submit it to the general influences of order and law. If we leave it as it is, in its independent, irresponsible authority, I see no alternative but repeal or civil war."

Preston.—The local papers mention that Joel Hobson, who was recently committed for trial at Birkenhead, on a charge of having, in conjunction with the woman who has been convicted, robbed Mr. Marquis of 1990*l.*, at the

Preston Guild, was tried at Knutsford last week, found guilty and sentenced to 14 years' transportation.

Ramsgate.—On Thursday the 22d the Dutch steamer Eberfeldt, was totally lost about 25 miles east of the North Foreland. She was built of iron at Blackwall about three years since, expressly for the Rotterdam and Manheim trade, and was proceeding to London for the purpose of being repaired. She was under the direction of Capt. Stranach, of the General Steam Navigation Company, who had been requested to bring her over from Rotterdam, and among the passengers was Mr. Bush, the Civil Engineer, who had availed himself of her return to try some experiments with a new compass which he has recently invented. She left the Brielle about half-past six A.M. and in the afternoon of the same day, while observing the action of the compasses, Mr. Bush remarked to Capt. Stranach that the ship's working appeared to be different from what it was when they left the Brielle, and that there was a strange vibration of the vessel. Scarcely had these remarks been made when the suspicions of Mr. Bush were confirmed; he begged Capt. Stranach to order the boats to be in readiness, for he was convinced that the vessel, being constructed of iron, would afford but few minutes to save themselves. Whilst this conversation was taking place another circumstance gave warning that their fears were well grounded, for the steamer broke completely in half. The boat was instantly launched and Mr. Bush and two others fell into it, the wind at this time blowing a brisk gale. The boat was rowed stern foremost towards the vessel to save the remainder of the crew, to which manœuvre may be attributed the saving of those who were still upon deck. The crew of the boat called out to Capt. Stranach, who was on the after part of the wreck, to save himself by springing with the oar into the sea, as her head and stern were collapsing. At this moment the wreck presented an extraordinary spectacle; the boiler bursting by the collapse threw up immense volumes of steam and water, and the vessel went down with a loud explosion. After going down Mr. Bush looked round for her crew, and one of the first he saw was Capt. Stranach struggling in the water supported by a portion of the wreck. The captain and several others were with much difficulty taken into the boat. Three persons were unfortunately lost, two stokers and the cook. The number saved were 13, who, after experiencing the greatest hardships for four hours in an open boat, were picked up by a vessel from Amsterdam, whose attention was attracted by a handkerchief hoisted as a signal of distress, and carried into Ramsgate. Capt. Stranach and Mr. Bush describe the whole occurrence as a dream, for from her breaking to her going down not more than five minutes elapsed. The accident is attributed to the error of constructing vessels of a great length with an enormous weight of engines, coals, and water amidship.

Warwick.—The local papers of last week contained long accounts of the extraordinary abduction of a young lady named Jane Page, only 13 years of age, by a young farmer of the name of George Gardener, from a seminary in this city. 50*l.* reward was immediately offered for their apprehension, but the police were unable to trace them out until Saturday evening, when they were discovered quartered at an inn in Douglas, in the Isle of Man, having been away a week, and captured full 250 miles from their native place. Gardener was instantly taken into custody and conveyed to Stretton near Warwick. On Wednesday he underwent an examination before a magistrate, the following being the substance of the evidence:—The young lady is the daughter of a wealthy farmer at Stretton, and upon her attaining her 18th year comes into possession of a large estate. The prisoner is also respectable and wealthy, and being desirous of becoming a farmer he was apprenticed to the young lady's father, so as to be instructed in the several branches of Agriculture. He was considered one of the family, and frequently had an opportunity of visiting the young lady whilst at school, but owing to her tender age not the least idea was entertained by their friends of an intimacy existing. On Saturday week the prisoner went to the seminary and informed the proprietors that he was instructed to convey Miss Page to her parent's residence, as she was going to stay there a short time with a few friends, and under such circumstances she was allowed to leave. The magistrate in reviewing the case remarked that if the prisoner's defence should be that the young lady was a willing party, it would not alter the offence, as he had absconded with her at such a tender age that she was considered not to know right from wrong. He was then committed to take his trial at the next assizes, being liberated on two sureties of 300*l.* each, and himself in a like sum.

Wigan.—It has been for some months the practice of the coal miners in this neighbourhood to enter into a society for the purpose of collecting subscriptions wherewith to "turn out" for wages in the winter months throughout the whole of the mining districts. The colliers in the town of St. Helens and its neighbourhood have now been "out" several weeks and subsisting upon this fund, thus causing the pits to be idle, and at a ruinous sacrifice to the masters, who have in consequence applied in Shropshire and there obtained other workmen, who were brought to St. Helen's, and were being escorted on the 20th by the county constabulary to the several works, when they were hooted by the turn-outs, amounting to several thousands, who ultimately rushed upon and violently assaulted the police. Some were however taken into custody, but were rescued, when a general riot between the parties was the result. During this affair stones were thrown at the officers, and several were much injured. It is feared that the people, who are in a state of desperation, will again arrange their plans and commit further offences.

Windsor.—We noticed in our last the generous direction given by her Majesty for the distribution of the unconsumed bread from the royal table among the poor of Windsor. Since that time her Majesty has been pleased to command that the whole of the refuse wine which is left in the decanters at the Royal table after dinner and supper, and which was formerly the perquisite of the waiters or pages' men shall be given under proper regulations to the sick and diseased poor residing within the towns of Windsor and Eton, and within the extensive district embraced by the Windsor Dispensary. The selection of the objects for the enjoyment of the benevolence of the Queen has been confided to the resident medical officer of the dispensary and to the surgeon to her Majesty's household at Windsor.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1,166*l.*; Birmingham and Gloucester, 1,683*l.*; Eastern Counties, 3,183*l.*; Edinburgh and Glasgow, 1,788*l.*; Great Western, 11,199*l.*; Grand Junction, 6,397*l.*; Glasgow, Paisley, and Ayr, 1,180*l.*; London and Birmingham, 13,364*l.*; South Western, 4,377*l.*; Blackwall, 549*l.*; Greenwich, 682*l.*; Brighton, 2,532*l.*; Croydon, 193*l.*; Liverpool and Manchester, 3,710*l.*; Manchester, Leeds, and Hull, associated, 5,484*l.*; Midland Counties, 2,278*l.*; Manchester and Birmingham, 2,722*l.*; North Midland, 3,885*l.*; Newcastle and Carlisle, 1,291*l.*; South Eastern and Dover, 2,332*l.*; Sheffield and Manchester, 478*l.*; York and North Midland, 1,504*l.*—The half-yearly meeting of the Eastern Counties Company took place last week. The report announced that since the amalgamation of the Northern and Eastern with the Eastern Counties the extension line to Newport had been commenced, and was steadily advancing towards completion. The carriage of cattle continued to increase, and promised an extensive trade. The goods depot in London was nearly completed, and the general traffic greatly on the increase. Bills had been introduced into Parliament for the construction of the Stratford Branch, and the extension line to Harwich. The expenditure of the company up to the present time upon the main line of railway had been 2,878,529*l.* The traffic account for the half-year exhibited a net balance applicable to a dividend of 4*s.* per share of 26,600*l.* The report having been proposed for adoption, a long discussion ensued upon a proposition, that the opinion of Sir W. Follett be taken as to whether the debenture shareholders were entitled to receive both dividend and interest upon their shares; but upon being put to the vote the proposition was lost by a large majority. The managing director entered into a variety of financial explanations, and after some desultory discussion the report was adopted, with a vote of continued confidence in the directors.—At the meeting of the Birmingham and Derby Junction last week, the report announced that the profit of the half-year has enabled the directors to declare a dividend of 28*s.* on the 100*l.* share; 9*s.* 4*d.* on the third shares; and 1*s.* 4*d.* on the eighth shares, the receipts having amounted to 38,547*l.* The subject of the amalgamation of this company with the North Midland and Midland Counties underwent warm discussion at the meeting, and it appeared to be considered by many of the shareholders that the terms proposed are not sufficiently favourable. Should the arrangement however be completed, it is understood, in order to put the eighth shares on a footing with the other stock of the company, that no further call is to be made on them, but that 2*l.* 5*s.* 8*d.* should be added to the present amount to bring the sum to 7*l.* 1*s.* 4*d.*, and that the excess of capital so subscribed should be distributed over the several classes of shares with the view to their reduction; hence, instead of original shares being 100*l.* they would be 95*l.*; the third shares, instead of being 33*l.* 6*s.* 8*d.* would be 31*l.* 13*s.* 4*d.*; each eighth share reduced in the same proportion being 6*l.* 14*s.* 9*d.* If no conclusion should be come to with respect to the question of amalgamation, then the shares are to stand as before.—The shareholders of the Maryport and Carlisle Railway are to receive 5 per cent. on the balance of revenue for the last half-year, and the directors express the hope of being able under present appearances, to give the shareholders a fair return for their investment. The development of traffic on this line has been slow, but it has now arrived at a point which is likely to continue remunerating.—The formation of a line of railway direct northwards from Leeds, by Harrowgate and Knaresborough, Ripley and Ripon, to form a junction with the North of England Railway at the Carlton or Thirsk station, was brought under the consideration of the inhabitants of Knaresborough, a few days ago at a public meeting, when a resolution was adopted approving of that line in preference to another proposed from Bolton Percy to Star Beck. By this proposed line, Newcastle and all parts of the north will be brought twenty miles nearer Leeds, Bradford, Halifax, &c., than they are at present, since they are obliged to go round by York. It will also materially assist in strengthening the communication between England and Scotland, and will open a direct communication between the valleys of the Aire and Calder, with their manufacturing population and the agricultural districts of the Wharfe, the Nidd, and the Swale.—On Sunday night, the 18th ult., a man named John Weller, was knocked down by a train while in the act of crossing the South-western Railway, near the Wimbledon station. He lingered in St. Thomas's Hospital until Monday last, when he died of concussion of the brain. The Jury at the inquest returned a verdict "That deceased was accidentally killed," expressing at the same time a hope that the directors would adopt some precautionary measure, either by locking the gates, or by the employment of an additional policeman, in order that similar accidents might be avoided in future.

IRELAND.

Dublin.—The weekly meeting of the Repeal Association was held on Monday, Mr. John O'Connell in the chair. After adverting to the reception given to his father in London, and particularly at the meeting of the Anti-Corn Law League, the chairman expressed his thanks to Lord J. Russell, Mr. Macaulay, Sir. T. Wilde, and the other members who supported Lord J. Russell's motion in the House of Commons. If, he said, he saw that the liberal members of the House of Commons had the power to do good for Ireland, he might, he did not say he would, ask himself whether they should not give them some kind of trial additional [loud cries of "No, no," and loud cheering]. He was happy to hear that answer from them; but if they could do good it would sadden his heart to think that some friends of Ireland might be won away from the glorious cause by any benefit that would fall short of the full, entire, and immediate restoration of their domestic Parliament. He conjured the people of Ireland in his father's name to continue as they had hitherto done, in peace and order, no matter what happened to the traversers. If they wished the iron to sink deep into his father's soul they would violate the peace. He believed there could be very little doubt that the Government would press punishment upon the traversers, merely for the purpose of showing they were determined to carry out their intentions; but no matter what happened, let the people of Ireland continue in their peaceful agitation, and redouble their exertions for the Repeal. Mr. Ray then read a letter from Mr. O'Connell, alluding with great satisfaction to the reception he had met with in London, and expressing his conviction that the Association will reciprocate these most laudable and honourable feelings, and that the Irish nation will show that Irish gratitude will at least equal English generosity. "We must cultivate," he said, "these kindly sentiments at both sides. The melancholy reflection however follows, that it is quite useless for the wise and the good in Great Britain to desire, as they do, cordially and sincerely, that justice should be done to Ireland. Alas! power has passed from the wise and the good, and is vested in the selfish and the bigoted. The monopolists and the bigots have got possession of Parliamentary power, class legislation prevails, the spirit of reform is extinct, or lives in little more than isolated individuals. The unhappy genius of Chartism is still sufficiently strong to delude some of the operative classes—of those to whom increased reform would give increased power to alleviate their hard condition, and improve the social state. Under these circumstances, every reasonable and just Irishman must see that there is nothing for Ireland save in and by the restoration of our own Parliament. There is not the least reason for any kind of despondency; on the contrary it appears to me to be as clear as the noon-day sun that the Repeal must succeed if the Irish people observe two essential conditions of success; the first is the strict observance of the peace, the total absence of riot, tumult, outbreak, or force, in short to continue peaceable under every circumstances, and in every event; secondly, to continue perseveringly and unremittingly the Repeal agitation; to continue that agitation in strictly legal channels, and in no other; to abandon and avoid any course that may be declared however wrongfully illegal, and to continue to model every public body into such a shape as shall set every prosecution at defiance; in short to continue constitutional and legal agitation so long as one shred of the constitution remains. Peace and Perseverance are our motto; perseverance and peace are the shibboleth to our success. Before peace and perseverance present difficulties will vanish, and by them Ireland will be restored to national dignity and prosperity." After announcing several contributions to the Rent, among which was the sum of 292*l.* 1*s.* from America, Mr. Smith O'Brien proceeded to address the Association. He said that since the last day of meeting, the House of Commons had, by a large majority, pronounced that they would not take into consideration the grievances of Ireland with a view to their redress. All that reasoning and eloquence could urge in their behalf had been pleaded in vain, and what, under such circumstances, ought to be their course? Did that event come on them unexpected? Did they not know that it was not information that the people of England wanted with respect to Irish grievances, for those grievances had been repeated as far as they were concerned, even to the extent of humiliation? It was not information they wanted, it was the disposition to right them. He next addressed himself to the Irish Whigs, the Conservatives, and the Federalists, and asked them what was the course they ought to pursue? He would tell them, they ought to rely upon themselves, and Ireland, oppressed as she was, would, by peaceable combination, again possess her domestic legislature. The Rent for the week was 624*l.*

Law.

HOUSE OF LORDS.—APPEALS.—Their Lordships met on Friday for the purpose of giving judgment on a writ of error in the case of "the Queen, *v.* Millis," which involves the question of the validity of Presbyterian mixed marriages. The Lord Chancellor commenced by stating the effect of a contract or engagement of matrimony *per verba de præsenti* previous to the Marriage Act, and cited Swinburne, Sir Edward Simpson, the Council of Trent, Mr. Justice Blackstone, and other authorities on that subject. The Council of Trent held that all clandestine marriages were null and void, but the canon law was never adopted as binding in this country, and the authorities cited showed that a contract *per verba de præsenti* was a valid marriage and might be enforced against either of the parties. His Lordship then referred to a number of cases, establishing that when a contract *per verba de præsenti* was followed by a marriage, solemnised *in facie ecclesiæ*, between one of the parties and another person, the latter marriage was not by pre-contract actually void, but merely voidable, and as a consequence that if such marriage was not annulled by a sentence of the Ecclesiastical Court in the lifetime of the parties, it could not afterwards be effected; but the widow would take her dower and the children must be held to be legitimate. The

principal incidents of this species of contract were, that the engagement was indissoluble; that either party might compel solemnisation; that the parties could not be punished for cohabiting together, and that such contract was sufficient to void, by means of a suit, a subsequent marriage entered into by either of the parties, and solemnised *in facie ecclesiæ*. This view was supported both by the Judges of the Ecclesiastical Courts and the common law authorities. The contract *per verba de præsenti* was, at the period to which he had referred, to use the expression of Swinburne, "in respect of its constituting the substance and forming the indissoluble knot of matrimony, regarded as *verum matrimonium*." But the same authorities which supported this view held that marriages of this description were irregular; that they were a looser sort of marriages; that they were not regular marriages though equally binding; and that in order to constitute a regular marriage, with all the consequences belonging to marriage in its perfect state, solemnisation was necessary. Swinburne said that spousals *de præsenti* did not produce all the same effects in England as a marriage solemnised in the face of the Church with respect to issue, the husband's property in the wife's goods and other matters. Lord Stowell and Sir Edward Simpson took the same view, and Mr. Justice Blackstone said that such marriages were valid for many purposes but not for all purposes. Upon the point whether a contract *per verba de præsenti* without solemnisation, would entitle the widow to dower, the Court below and the Court of Appeal were of the same opinion—they were both against the claim to dower. We had come therefore to the conclusion that according to the concurrent opinions both of the ecclesiastical and the temporal Judges these irregular and loose sort of marriages did not confer those rights of property, or the more important right of legitimacy, consequent on a marriage duly solemnised according to the rites of the Church of England. A great deal of discussion had taken place in reference to the religious ceremony. It appeared from the authorities to which he had referred that it was formerly considered essential to the full effect of a marriage that it should be solemnised by the Church, and if persons not in holy orders performed the ceremony they exposed themselves thereby to heavy censure. It was said that a marriage might be valid, though not performed by a person in holy orders conferred by episcopal ordination. In that statement he could not concur. Holy orders were orders conferred by episcopal ordination, and what was required to be done by a minister in holy orders could not be done by a minister of the Scotch Church. The question was not affected by the Toleration Act, which merely removed certain disabilities, and did not alter the law in this respect. The claim made by the Presbyterians of Ireland could not be supported on any principle which would not equally apply to any body of Dissenters. He respected the character, learning, and piety of Presbyterian ministers, but this question must not be determined by any such considerations. Many observations had been made on the marriages of Jews and Quakers. The Jews had always been treated as a distinct people, who were governed by their own religious observances, and had their own matrimonial law. Some difficulty existed as to the case of the Quakers, and Lord Hale, in a case which came before him for decision, in order to avoid making those children bastards, directed the Jury to return a special verdict. He saw no ground for altering the view which he had taken on this subject, agreeing as it did with what had been laid down by the most eminent civilians, and with the corresponding doctrines of the Courts of common law, from the earliest periods of their history. Now he had been led, in consequence of the important nature of the interests involved, to enter more largely into the subject than under other circumstances he would have felt justified in doing. The immediate question before them was, whether George Millis was or was not guilty of the crime of bigamy, and then the question was, whether a contract *per verba de præsenti* was sufficient to support such an indictment. He defined what he considered the effect of such a contract to be, and then adverted to the change that had been operated on it by the 13th section of the English Marriage Act, and concluded an elaborate judgment by saying—"My opinion therefore, after the most anxious consideration, and on the grounds and reasons I have stated, but still with all deference and respect to those who differ with me on this subject, is that the indictment against the defendant George Millis for bigamy, cannot be sustained."—Lord Cottenham in delivering his decision, said that in the whole course of a long professional life he had never met with so embarrassing a case. The highest names in the history of the law were on this subject opposed to each other. The present inquiry involved a consideration of the state of the law previously to 1753, 90 years since it ceased to exist, and this added a difficulty to the inquiry, which it was of the utmost importance to keep in mind. Before the Council of Trent, a marriage *per verba de præsenti* was a legal marriage, as it was in Scotland at the present day. At that time England was subject to the canon law, like other countries; but by the 25th of Henry VIII., the canon law was declared to have no effect, except so far as it had been adopted by the consent and custom of the people. Sir W. Blackstone and Sir M. Hale both laid it down that the canon law only then became part of the common, or unwritten law. By the Council of Winchester, it was laid down that a marriage without the benediction of a priest in holy orders was not a valid one, and that any other was to be deemed fornication. From the earliest times the law of England had differed from the civil and canon law, and required the intervention of a person in holy orders to make a marriage valid. He then proved from an immense mass of authorities, the nature of a contract *per verba de præsenti*; first, such a contract did not give the woman the right of a wife, as far as entitling her to a dower; secondly, such a contract did not give the man the right of a husband to the property of the woman; thirdly, such a contract did not confer on the issue of the marriage the rights of legitimacy; fourthly, such a contract did not confer on the woman the capacity of coverture; fifthly, such a contract did not make the marriage of either of the parties with a third person, during the life of the other, a void or invalid marriage. Each of these points he supported with cases and decisions. He next stated that though a contract *per verba de præsenti* was an essential part of a marriage, as between the parties themselves, yet the authorities spread over a period of 700 years did not hold it to be a valid marriage for all the above purposes, without the intervention of a person in holy orders; and that person must be one whom the church considered to be in such holy orders, which no Presbyterian minister could possibly be. He was aware of the difficulties and hardships that the decision might create; but happily it was in the power of Parliament to remedy those difficulties, and to remove those hardships. They were here for one purpose only, that of laying down the law, and in the performance of that duty he was bound to declare that the first marriage in the case before them was not a valid one; that therefore the party accused of bigamy, the defendant George Millis, could not legally have committed the offence with which he was charged. Lord Brougham, after bearing testimony to the ability and research displayed in the judgments just read, said he should move that the further consideration of the case be postponed, in order that the judgments of the two noble lords might be printed, for the consideration of the rest of the law lords, that they might be compared with the authorities, on points on which he was yet doubtful how far he concurred with the two noble and learned lords. He contended that the present case afforded a proof of the advantage of the practice he had introduced since he was on the bench, and which he wished was more general, of judges, in cases of importance, delivering written decisions.—Lord Campbell also concurred in the suggestion of the noble and learned lord for the same reasons. The Lord Chancellor consented, and the further consideration of the case was then postponed.

BIRTHS.—On the 20th inst., at Northenden, Cheshire, the wife of J. C. SOMMERS, of Manchester, of a son—23d inst., at Heyrood, near Ashton-under-Line, the lady of L. RICHMOND, Esq., of a daughter—25th inst., at Calverly-park, Tunbridge Wells, Mrs. J. OLDHAM, jun., of a son—25th inst, at Poddington, Bedfordshire, the lady of the Rev. J. BREBETON, of a son—26th inst., in Claremont-square, Pentonville, the wife of Mr. G. C. MASTERS, of a son—26th inst., at the Rectory, Colmere, Hants, the lady of the Rev. J. B. BOURNE, of a son—26th inst., at Elm Lodge, Elstree, Herts, the lady of R. H. S. JACKSON, Esq., of a daughter—27th inst., in Upper Seymour-street, Portman-square, the lady of T. F. MAITLAND, Esq., of a daughter.

MARRIED.—19th inst., at Auchleeks-house, Blair Athol, Perthshire, E. W. GARLAND, Esq., eldest son of N. Garland, Esq., of Michaelstow-hall, Essex, and of Woodcot-grove, Epsom, Surrey, to AMELIA, second daughter of R. Robertson, Esq., of Auchleeks, and of Membland-hall, Devon—19th inst., at Pau, Basses Pyrenées, first according to the municipal forms of France, and afterwards by the Rev. E. Hedges, British Chaplain at Pau, Commander the Hon. B. CARY, R.N., to SELINA MARY, daughter of the late Rev. F. Fox, of Fox-hall, county of Longford, Ireland—23d inst., at St. George's, Camberwell, Mr. W. SCOTT, of Peckham-rye, to MARGARET, daughter of the late Mr. T. Hall, of Bishopsgate-street—24th inst., at St. Mary's Church, Bryanston-square, A. H. CHAMPAGNE, son of the late General Sir Josias Champagne, to CATHERINE MARY, daughter of R. T. Garden, Esq., of River Lyons, in the King's County, Ireland.

DIED.—7th inst., at Portsmouth, ANNA MARIA WILLIAMS, sister of the late Colonel Sir Richard Williams, K.C.B.—12th inst., in Hunter-street, Brunswick-square, ARTHUR, aged 3, and on the 23d, JOHN FINLAY, aged 6 years, children of the late John Dew, who expired on the 21st, all of scarlatina—13th inst., at Florence, MARGARET, wife of Stafford Price, Esq., of Hendon-house, Middlesex—16th inst., at his residence in Milton-next-Gravesend, J. READ, Esq., of the Royal Marines, aged 55—20th inst., of consumption, W. FRASER, Esq., youngest son of the late J. Fraser, Esq., of the Six Clerks' Office, Chancery-lane—20th inst., G. CHAPMAN, Esq., of the Dane, Margate, Kent, aged 53—20th inst., at Sydenham, CHARLOTTE, widow of the late Mr. Edward Wicken, of Deptford, Kent—20th inst., at Walworth, the Rev. T. G. ACKLAND, D.D., rector of St. Mildred's, Bread-st., aged 54—21st inst., J. S. HULBERT, Esq., of Portsmouth, and late a magistrate in that place, aged 66—22d inst., at Effingham, MARIA FRANCES SELINA, the eldest and beloved daughter of Hillebrant Meredith Parratt, of Effingham-house, Surrey, aged 18—23d inst., at 40, Sackville-street, ELIZABETH, wife of J. W. Prout, Esq., of Lincoln's-inn, barrister-at-law—23d inst., in George-street, Portman-square, ELIZABETH CAROLINE, only daughter of C. Derby, Esq.—23d inst., at the residence of her son, Queen's-buildings, Brompton, ELIZABETH, relict of the late Thomas Tyerman, Esq., of Holles-street, Cavendish-square, aged 71—23d inst., in Chester-square, the infant son of Captain and the Hon. Mrs. Charles Stuart.

GAZETTE OF THE WEEK.

BANKRUPTS—C. B. BAYLEY, Abingdon, Berks, draper—T. HODSON, Middlesex, butcher—W. H. CHAPLIN, Inworth, Essex, bricklayer—W. SCOTT, Regent-street, wine-merchant—T. GREENING, Worcester, surgeon—T. MURRAY, Manchester, travelling draper—J. HELLEWELL, Salford, dyer—R. GENT, Hulme, traveller—F. JONES, Bristol, grocer—W. BATTY, Kingston-upon-Hull, carrier.

ROWLAND'S MACASSAR OIL. — Patronised by Her Majesty, H. R. H. Prince Albert, the Royal Family, and the several Courts of Europe.—This elegant, fragrant, and pellucid Oil, in its preservative, restorative, and beautifying qualities is unequalled over the whole world. It preserves and reproduces the hair, even at a late period of life; prevents it from turning gray; or if so changed, restores it to its original colour; frees it from scurf and impurity, and renders it soft, silky, curly, and glossy, and retains its curl and other decorative form uninjured by the variations of the atmosphere or the effects of the crowded assembly—facts which are abundantly proved by the numerous testimonials which may be seen at the Proprietors'.

Its value is of course enhanced by being used at an early period of life, and to children it is especially recommended as forming the basis of a beautiful head of Hair. Price 3*s*. 6*d*., 7*s*., Family Bottles, (equal to four small,) 10*s*. 6*d*., and double that size, 21*s*. per bottle.

CAUTION.—Each genuine bottle has the words "ROWLAND'S MACASSAR OIL," engraved in two lines, on the wrapper, and on the back of the wrapper nearly 1500 times, containing 29,028 letters. Be sure to ask for "Rowland's Macassar Oil."

Sold by the Proprietors, A. ROWLAND and SON, 20, Hatton-garden, London, and by Chemists and Perfumers.

*** All others are spurious imitations!!!

SOILED LINENS.—The SAMPLE LINENS of those celebrated makers KNOX and Co. for Irish linens, and BEVERAGE and Co. for table linens, have been contracted for by BROOKS and WIGHTWICK, in the Borough. These linens are soiled only by showing to the trade as samples; they are specimens of the best made by these celebrated manufacturers, and are now being sold at half the prices of the same goods when clean. Splendid damask table cloths, three yards long, 7*s*. 6*d*. each; two yards square, each 2*s*. 9*d*.; five yards long superb damask cloths, suitable for the table of the nobility, 26*s*. each; fish napkins, 2*s*. 6*d*. the dozen; finest damask napkins, yard square, the dozen, 10*s*. 6*d*.; Knox's extremely fine Coleraine Irish, twenty-six yards for 25*s*.; stout and serviceable, twenty-six yards for 20*s*, usually sold at 1*s*. 6*d*. per yard; and a large lot of linen sheeting, commencing at 4*s*. 6*d*. the pair, without a seam. Samples of these linens sent by horse and cart to any part of town, or forwarded into the country if written for, from BROOKS and WIGHTWICK'S extensive Establishment, 196, High-street, Borough, facing the end of Union-street. The premises being 300 feet deep, country Drapers will find it to their advantage to call at the wholesale warehouse in King-street.

THE BEST ENGLISH WATCHES.—A. B. SAVORY and SONS, Watchmakers, 9, Cornhill, London, opposite the Bank, request the attention of purchasers to their stock of London-made PATENT LEVER WATCHES, which are manufactured by themselves in their own house. In silver cases, with the detached escapement and jewelled, the prices are four and a half guineas, six, and eight guineas each; or in gold cases, 10, 12, 14, and 16 guineas each. The very large stock offered for selection includes every description, enabling a customer to select that which is more particularly adapted to his own use.

GREAT ECONOMY.—Much time and a great deal of labour will be saved by the use of the SUSSEX CHURN. ATTWOOD, WIMBLE, and WARNER, Manufacturers, Lewes. This Churn being made entirely of block tin, the necessary degree of temperature can be given to the cream, by placing it in a pan of cold or hot water, which ensures the butter coming in 10 or 12 minutes at all seasons of the year. The simplicity of its construction, and the facility with which it may be cleaned, are no inconsiderable advantages over those now in common use.

Sizes.	Nos. 00.	0.	1.	2.	3.
Churn	2½ lbs.	4 lbs.	7 lbs.	14 lbs.	28 lbs. of butter.
Price with pans complete,	18*s*.	20*s*.	21*s*.	32*s*.	40*s*.

Delivered, carriage paid, to any part of London.

London Agents.—BENHAM, 19, Wigmore-street, Cavendish-square; LIVERMORE, 30, Oxford-street; BAILY, 71, Gracechurch-street; WRIGHT'S Range Warehouse, near the Monument.

Export Agent.—BARNES & Co., 109, Fenchurch-street.

N.B.—To be seen at the Polytechnic, and Adelaide Gallery.

Observe.—The Improved Water Pail, 4*s*. and 5*s*. each.

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the Public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the Apparatus; and B. and H. can safely recommend it from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices, to 130, Fleet-street.

WANTED, A DAIRY-MAID.—A steady respectable Woman, thoroughly acquainted with the method of making Stilton Cheese, of the first quality. To a well recommended and well qualified person liberal wages would be given.—Letters (free) to be addressed to S. T., Mr. HEBDITCH'S, 51, Lisson-Grove, London.

WANTED A HEAD GARDENER.—By a Gentleman residing near Godalming, a married Man from 30 to 40 years of age, who possesses first-rate practical knowledge of his profession in all its different departments, as regards Fruit as well as Flowers, and who can give testimonials of the same, and also of his unexceptionable moral conduct, honesty, and good temper. Wages 80*l*. a year, with a Cottage; and he will have under him five men, two boys, and one woman.—Direct Post paid, to A. Z., Post-office, Godalming, Surrey.

WANT PLACES.—All Letters to be post-paid.

AS HEAD GARDENER.—A middle-aged married Man, without family. Satisfactory reasons can be given for leaving his present situation, where he has been living upwards of three years, and where he has had the management of Pines, Grapes, Greenhouses, Framing, Kitchen garden, Pleasure Grounds, Plantations, Coppice Land, &c.—Direct to F. T., Post-office, Chichester, Sussex.

AS HEAD-GARDENER, a single Man, aged 30, who perfectly understands gardening in all its branches, also farming and woods if required. Can have an unexceptionable two and a-half years' character from his late employer.—Direct, to the Secretary, Regent's Park Gardeners' Mutual Instruction Society, 64, High-street, Marylebone.

AS GARDENER.—A middle-aged married Man, without incumbrance, who has a good knowledge of Pines, Vines, also of the Hothouse and Greenhouse, and Early Forcing in general. Perfectly qualified in all the other branches of Gardening. Can have an unexceptionable character from the situation he has just left. No single-handed place accepted.—Direct to S. S., Mr. CHANDLER'S Nursery, Vauxhall-road. Distance no object.

AS GARDENER.—A middle-aged married Man, who perfectly understands his Business, and capable of managing a small Farm if required. His wife understands and would take charge of a Dairy and Poultry. Character will bear the strictest inquiry. Apply by letter to A.B., Post-office, Totten, near Southampton.

AS GARDENER.—A young Man, aged 27, who has a thorough knowledge of his businessin all its branches, and whose character will bear the strictest investigation.—Direct to Mr. WM. BARNES, Gardener to Geo. W. Norman, Esq., Bromley Common, Kent.

AS GARDENER.—A single Man, aged 26, who thoroughly understands his business in the Kitchen and Flower Garden, Forcing and Framing, and has a thorough knowledge of Pines and Grape-growing. Can have an unexceptionable character from the Gentleman he has lived with two years.—Direct to E. D. C., at Mr. ROBINSON'S, 39, Great Russell-street, Bloomsbury, London.

AS GARDENER.—A respectable single Man, who has a thorough knowledge of every branch of Gardening, Forcing, Flower Garden, Wall Trees, Cultivation of Plants, &c. &c.—Direct to A B.C., 13, Richmond-street, Edgeware-road, London.

AS GARDENER.—A married Man without family, aged 30, who understands his business in all its branches; can have a three and a half years' character from his last situation; has no objection to milk a cow, take charge of meadowland, if required, and make himself generally useful, and to live in the house; his Wife is a good cook and can take charge of a dairy and poultry.—Direct to Y. Z., Mr. DORRELL'S, Tranquil Vale, Blackheath.

AS GARDENER.—An active Man, aged 35, of respectable habits, and well experienced in all the superior branches of Gardening; has a good practical knowledge of Plants, Flower-gardening, &c., and is capable of taking the management of Woods, Plantations, Ground-work, &c., or a small Farm, if required: his character will bear the strictest investigation. Terms will not be extravagant.—Direct to S. H., at Mr. PAMPLIN'S Nursery, Hornsey-road, Holloway.

TO GARDENERS.

A YOUTH, wishing to learn the art of Gardening, would give any Gentleman's Gardener a Premium to teach him. A moderate amount of wages would be required.—Direct to A. B., 31, Carey-street, Lincoln's Inn-fields.

AS PROPAGATOR or FOREMAN.—A single Man, aged 27, who understands the general routine of Nursery business, having practised in some of the first London Nurseries. Direct, with particulars, to A. B., Post-office, Kingsland Green.

AS FARM BAILIFF.—A single Man, aged 31, who can be well recommended; has had considerable experience in Farming, and is well acquainted with the general business of an Agriculturist, including levelling, surveying, mapping, draining, and agricultural chemistry and mechanics; is desirous of obtaining a situation at a moderate fixed Salary, and to be entitled (after allowing a fair rent and good interest to the proprietor for the capital employed) to a share of the surplus profits, if any should accrue.—Direct post paid to R. A., care of WM. STICKNEY, Ridgmont, near Hull.

A GENTLEMAN, having extensive Woods in the North of England, wishes to recommend his FORESTER (a Scotchman, brought up under the late ROBT. MONTEITH, Author of the "Forester's Guide") who has acted for him during the last 12 years, can now devote a considerable portion of the year to such other parties as may be pleased to employ him. He undertakes to manage, value, or report upon, Plantations and Woods in every stage of growth or condition. Terms moderate.—Apply to Mr. HOWLET, 13, Bartlett's-buildings, London.

AS LAND STEWARD or BAILIFF.—A young Man 36 years of age, without incumbrance, who was 9 years in his last situation, and who is well acquainted with the present improved mode of Agriculture, as also the general management of Stock. The most unexceptionable references and reasonable security will be given. Direct to R. W. M., Post office, Hoddesden, Herts; or to W. H. COTTRILL, Esq., 32, Throgmorton-st., London; or to Messrs. LONGMORE and SWORDER, Solicitors, Hertford.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

A Stamped Newspaper of Rural Economy and General News.—The Horticultural Part Edited by Professor Lindley.

No. 10.—1844. SATURDAY, MARCH 9. [Price 6*d*.

Lichens on stones, to kill	149 *a*	Yew hedge, to improve	152 *c*

GARDENER'S BENEVOLENT INSTITUTION.—Notice is hereby given, that an Election for three Pensioners on the Funds of this Charity will take place in June next. All persons desirous of becoming Candidates, are requested to forward their testimonials and certificates to the Secretary on or before the 28th inst. (after which time they will not be received), and of whom printed forms of application may be had.

By Order, Edwd. R. Cutler, Secretary, 97, Farringdon-st.

EUCHARIDIUM GRANDIFLORUM—A SPLENDID NEW HARDY ANNUAL.

WILLIAM MAY begs to offer the above new and beautiful Annual for the first time, seeds of which were kindly presented to him in 1842 by Capt. Widdrington, R.N., who introduced it from the Royal Botanic Garden of St. Petersburg. It is twice the size of E. concinnum, of a brilliant dark rosy red, and very appropriate for masses or beds, blooming most part of the summer, and is decidedly one of the best of annuals in cultivation. May be had in packets, at 2*s*. 6*d*. each, Post-paid.

William May, Hope Nursery, Leeming-lane, Bedale, Yorkshire

WILLIAM MASTERS begs to call the attention of the Nobility, Gentry, &c., to his newly and well assorted COLLECTION OF GARDEN AND FLOWER SEEDS, which being principally grown under his immediate inspection, he can particularly recommend.

100 papers finest Annual Flower Seeds			24*s*. 0*d*.
50	do.	do.	12 6
25	do.	do.	6 6

[If the selection is left to W. M.]

Forwarded by Post without additional charge. POTTER'S ARTIFICIAL GUANO and CONCENTRATED LIQUID GUANO.

Exotic Nursery, Canterbury, Mar. 1844.

NEW FUCHSIAS, VERBENAS, STRAWBERRY PLANTS, &c.

WARNER and WARNER, Seedsmen, 28, Cornhill, London, beg particularly to recommend the following to their friends:—NEW FUCHSIA, Queen Victoria, Vesta, Gigantea, and all Smith's new Seedlings.

Agents for Epps's Bridegroom, 5*s*.; Espartero, 7*s*. 6*d*.; Kentish Hero, 5*s*.; Duke of Wellington, 5*s*.; Winserii, 5*s*.; Emperor of China, 5*s*.; Prince of Wales, 5*s*.; Kentish Bride, 7*s*. 6*d*.

Agents for Standish's New Fuchsias, (see plate in "Paxton's Magazine" for March); Attraction, 7*s*. 6*d*.; President, 7*s*. 6*d*.; Colossus, 7*s*. 6*d*.; Antagonist, 5*s*.; Conductor, 5*s*.; Candidate, 5*s*.; and all the leading varieties worth notice.

Verbenas, all the new varieties, Choice Dahlias, Carnations, Picotees, &c.; Achimene pedunculata, Rosea grandiflora, &c. &c.; new and choice Panseys; plants of Nemophila discoidalis; New Black; Petunia punctata—7*s*. 6*d*. each. Cinerarias, all the choicest varieties. Princess Alice Maude Strawberry, 60*s*. per 100: this is considered the best Strawberry known. Prince Albert, 20*s*.; Myatt's Deptford Pine, 50*s*.; Myatt's British Queen, 7*s*. per 100; and all the other well-known varieties. Agents for the sale of all the late Mr. J. C. Loudon's Works.

FLOWER SEEDS—36 Packets, 10*s*.; 18 ditto, 5*s*., forwarded, postage free, to any part.—Apply to Mr. John Brown, Albion Nursery, Stoke Newington, London. Any preferred species may be specified in the order. Payment by Post-office order or stamps.

J. H. Brown has on sale an extensive collection of the most approved Plants for greenhouses and conservatories. Parties building large or small greenhouses can be well supplied.

LISIANTHUS RUSSELLIANUS.—A Packet of Seeds of this most Beautiful Plant, with Directions for Growing it Successfully, at 2*s*. 6*d*. The following observations are from Doctor Lindley, in the "Gardeners' Chronicle:"—"This fine plant, introduced from Texas in 1835, is still uncultivable in the hands of many good gardeners, yet we occasionally see noble specimens on the exhibition tables near London, a sufficient proof that the plant may be grown well under proper management. Among the most successful cultivators of it is Mr. James Cuthill, Florist, Camberwell."

Remarks of Mr. Harrison, in the "Floricultural Cabinet:"—"We visited Mr. Cuthill's establishment to see the Lisianthus growing in its various stages; all his plants were in the greatest vigour, exceeding any others we had seen exhibited."

The true Beechwood Melon, from the Horticultural Society, 2*s*. 6*d*. Cuthill's Early Melon, 2*s*. 6*d*., or the 3 packets of seed sent post free for 6*s*.

Also Cuthill's Prince of Denmark Scarlet Clove, or Nosegay Carnation, 12*s*. per doz. "The best border Carnation we know." Doctor Lindley.

Also a new broad-leaved Musk-scented Mimulas, at 1*s*. each.

Direct, James Cuthill, Denmark-hill, Camberwell, London.

N.B. The Lisianthus plants are all disposed of.

NORWOOD POTTERY, SURREY.—ESTABLISHED 1818.

R. H. MARSHALL begs to submit to Nurserymen and Agriculturists his GARDEN POTS, DRAIN TILES, &c. of the same excellent material which gave such general satisfaction during the long period his father had possession of the premises. They can be had as above at the lowest remunerating price: Terms, cash or a reference.

NEWEST, CHEAPEST, AND VERY BEST FUCHSIAS AND VERBENAS.

Fuchsias.—12 fine choice distinct sorts, for . . 7*s*. 6*d*.

" 12 extra very superior, selected from all new kinds sent out last season for the first time, for 15 0

Such as Exoniensis, Enchantress, Balloonifiora, Toddiana, Eppsii, Cormackii, Dennisiana, Prince Albert, Laneii, Frostii, Grenvillii, Fairy Queen (Bell's), Iveryana, Gem (Ivery's), Nobilissima (Smith's), Majestica (Smith's), Defiance (Smith's), Robusta (Smith's), Stanwelliana, Transparens (Youell's), Deansii (Dean's,) Recurva (Dean's), Alice Maude Mary (Bell's), Princess Royal (Bell's), Brockmanii, Prince of Wales (Bell's), Lowryii, &c.

Verbenas.—12 fine distinct varieties, for . . 3*s*. 6*d*.

" 12 extra and very superior, for . . 6 0

Such as Duke of Cornwall (Knight's), Speciosa (Kyle's), Princess Royal (Youell's), Howardiana (Low's), Prince of Wales (Wood's), Cærulea (Harrison's), Boule-de-Fue (Girling's), Tweediana picta, Minstrel Boy (Girling's), Rosy Queen (Halley's), &c. &c. &c.

Purchasers are requested to send the names of those kinds they already possess; and Mr. Miller pledges to send them entirely different, and sorts such as will add beauty as well as novelty to their collections. Mr. M. is enabled to do this satisfactorily, having bloomed every new kind sent out last season.—See extensive list in this Paper of Feb. 17, 1844.

100 fine Hybridised Fuchsia Seeds, 7*s*. 6*d*.; fifty, 4*s*.; Geranium Fireball, 5*s*.; Black Nemophylla discoidalis (plants) 1*s*. each.

The above will be sent post free, packed in stout tin cases, so as to warrant their arrival to any part in safety; or may be had in pots, carriage paid to London, and no charge for packing or hamper.—W. Miller, Providence Nursery, Ramsgate, Mar. 7.

BUSHELL'S Light Seedling Dahlia "Emma."—Plants in May, 10*s*. 6*d*. Colour white, tipped with deep cherry; the petals, form, and centre, good; the largest, most constant, and free in flowering of any Dahlia yet propagated, and has obtained several prizes. "Pet Rival" Plants in May, 5*s*. Colour, purple maroon; fine cupped petal and free bloomer; exhibited in several winning stands last season. Kennington Rose, Plants in May, 5*s*.; most constant Rose grown. To be had of Messrs. Ansell, Camden Town; S. Girling, Stowmarket; F. and A. Smith, Hackney; and J. Bushell, 12, Hall-place, Kennington-lane.

JOHN MILLER, surviving Partner of the late firm of Sweets and Miller, Nursery and Seedsmen, Bristol, begs respectfully to inform Nurserymen, the Trade, and his Friends in general, that he has commenced business as Auctioneer and Valuer of Horticultural and Agricultural Stock, &c., and hopes by strict attention to the interest of his employers, to merit their support. Letters addressed to John Miller, Portland House, Kingsdown, Bristol, will meet with immediate attention.—Bristol, Mar. 8, 1844.

TO THE NOBILITY, GENTRY, CLERGY, AMATEURS, AND OTHERS.

THE SUBSCRIBER begs to state that he is prepared to supply the undermentioned, viz.:—

Cineraria, "The Queen of May,"—a beautiful sky-blue, of shrubby compact growth, quite new colour, of fine form and large size, at 5*s*. each.

Cinerarias—12 of the most distinct and approved varieties for 20*s*.

Fuchsias—25 distinct fine sorts, including his own seedlings, for 20*s*.

Calceolarias—20 distinct and good sorts, of all shades of colour, for 30*s*.

Hollyhocks—fine strong one-year-old plants from his best selected seed, 20*s*. per 100.

Herbaceous Plants of the most showy varieties, correctly named, 100 sorts for 42*s*.

Hardy, Flowering, and Evergreen Shrubs, in 50 sorts, two plants of each, correctly named according to Loudon's "Arboretum Britannicum," at 42*s*. per 100, including package.

He will also have to offer in April a new Collection of beautiful Calceolarias, not yet sent out, a Descriptive Catalogue of which is in preparation, and will be forwarded to applicants. These are from his own celebrated Stock, and of the same breed as his Cal. "Lady Constable," so much in repute.

Seeds in packets of Hollyhock, Pansy, Picotee, Calceolaria, and Hybrid Fuchsia, at 2*s*. 6*d*. and 5*s*. each.

TO THE TRADE, MARKET-GARDENERS, AND OTHERS, he begs to state that he has yet to offer a few thousands of Gooseberries, and the large Red Antwerp Raspberries.—The Gooseberries are comprised in upwards of 100 of the most generally useful kinds in cultivation, and the Red Antwerp Raspberry is decidedly the best sort grown, for produce, size, and quality; both of which he will offer on very moderate terms, in quantity. The plants are young, clean, strong, and healthy, two and three years old.—Also May's new large late red "Victoria Currant," a dish of which was sent to and exhibited in 1842 at the Horticultural Society in Regent-street, London, some of the bunches of which measured 6 inches in length, and individual berries 1¼ inch in circumference—15*s*. per doz. New Black Bang-up Currants, 6*s*. per doz. The usual allowance to the Trade on the Currants.

Woollen Net for protecting Fruit-trees from frost, of the best material, at 9*d*. per yd.

Stove and Greenhouse Plants and Florists' Flowers of every description. Forest and Fruit Trees, Garden and Flower Seeds, of all the approved sorts. William May.

Hope Nursery, Leeming-lane, near Bedale, Yorkshire.

DAHLIAS.—KEYNES' Standard of Perfection; DODD'S Orange Superb; and DOWDING'S Emma Noke.—The Stock of these splendid DAHLIAS is in fine condition, and will be sent out the 1st of May. A List of the Nurserymen who have ordered and can supply Plants, will be advertised the 1st of April. Gentlemen who intend growing these varieties may, by giving early orders, depend on fine Plants the first week in May.—Salisbury, March 5, 1844.

FASTOLFF RASPBERRY.

PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN, HIS GRACE THE DUKE OF RUTLAND, THE MOST NOBLE THE MARQUIS OF AILSA, THE EARL OF HARRINGTON, THE EARL OF LIVERPOOL, THE LORD BISHOP OF LONDON, LORD VISCOUNT LORTON, LORD SONDES, &c. &c; as well as by the HORTICULTURAL SOCIETY OF LONDON.

YOUELL and Co. have much pleasure in announcing they are now supplying fine Canes of the above highly-valuable and much-esteemed RASPBERRY, unequalled for the extraordinary size of its fruit and richness of flavour.

Those to whom Y. and Co. sent it last season have expressed their high admiration of its superiority over all other varieties, and has been awarded several prizes from various Horticultural exhibitions during the season. As a proof they have not exaggerated its excellent qualities, fruit was submitted to Dr. Lindley, (see *Gardeners' Chronicle* of the 22d July last, page 562), whose opinion of it is as follows:—

"Fastolff Raspberry.—We have received from Messrs. Youell, of Great Yarmouth, fruit of the Fastolff Raspberry, and we find its merits all that has been stated in favour of its excellence. The fruit that we have received is very large, obtusely conical, and of rich flavour, far exceeding in this respect some other new and large varieties. The plants bear abundantly and in long succession."

They also exhibited it on the 1st of August, 1843, before the London Horticultural Society, 21, Regent-street, to which a prize was awarded. It would therefore be unnecessary for Youell and Co. to recommend it more fully, or with greater confidence to the notice of the public, merely observing, that it continues in high perfection throughout the autumnal months, and has maintained its superiority in the most unfavourable soils and situations, and requires no other than the ordinary treatment of the old varieties.

Fine Canes are ready for delivery, and can be sent with safety to any part of the United Kingdom (on the receipt of a Post-office order), upon the following terms:—

Packages containing	100 Canes	. .	£2 5*s* 0*d*.
Do.	do.	50 do.	. . 1 5 0
Do.	do.	25 do.	. . 0 14 0

Package included.

The usual discount to the Trade, when not less than 200 are ordered.

*** Caution.—Y. and Co. beg to call the attention of their Friends and the Public in general to the fact that they have appointed no Agents in London for the sale of the above, and cannot be held responsible for its being genuine, unless purchased direct from their Nursery.

THE NEWEST AND VERY BEST FUCHSIAS, VERBENAS, PETUNIAS, ANAGALLIS, &c., FOR 1844.

YOUELL and Co. beg to refer the Readers of the *Gardeners' Chronicle* to their Catalogue of the above, which appeared in this Paper of last week, and will be found to contain such varieties only as are worthy of cultivation.

Youell & Co. being the parties who first sent out per post, with safety, these tribes of plants, are desirous of calling attention to their advantageous method of executing orders, namely, that they will deliver them free of postage (on the receipt of a Post-office order), to any part of the United Kingdom, upon the following terms:—

12 Extra Fine varieties, 12*s*, the Selection left to Youell & Co.
12 ditto ditto 21*s*., the Selection left to the Purchaser.
50 Fine varieties . . 40*s*., the Selection left to Youell & Co.
50 Extra Fine ditto . 60*s*., the Selection left to the Purchaser.

With the exception of those marked thus.*

The plants will be strong and healthy, and ready for delivery by the latter end of March, with the exception of those marked thus * (which will be ready in April), thus ensuring the Purchaser fine plants for competition in the ensuing season. Many of the varieties can be supplied new.

YOUELL'S TOBOLSK RHUBARB, Patronised by Her Most Gracious Majesty the Queen, and many of the Nobility, 12*s*. per dozen. For particulars of which see their Advertisement of the 16th November.

TWO NEW SEEDLING PICOTEES.—"Lady Alice Peel," 10*s*. 6*d*., and "Mrs. Benyon," 10*s*. 6*d*. per pair.—These two splendid Picotees were raised by the Rev. J. Burroughes, of Lingwood Lodge, Norfolk, and kindly presented by that gentleman to Messrs. Youell & Co., for particulars of which see their Advertisement in this Paper of the 16th of Sept.

FINEST CARNATIONS AND PICOTEES.

YOUELL and Co. beg to refer the Readers of the *Gardeners' Chronicle* to their Extensive List, with Prices, of the above highly-esteemed Flowers, which appeared on the Advertising pages, 766 and 767, of this Paper, of October the 14th, and will be found to contain every variety worthy of cultivation.

		Prices as follows:	£. *s*. *d*.
12	pair of good Show Sorts	. . . . .	1 4 0
12	ditto fine ditto	. . . . .	1 10 0
25	ditto ditto	. . . . .	3 0 0
12	ditto extra fine and very superior ditto	.	2 10 0
25	ditto ditto	. . . . .	5 0 0

The selection being left to Youell & Co.

ARAUCARIA IMBRICATA.

YOUELL and Co., possessing the most extensive stock in the country of the above Splendid Hardy Ornamental Tree, beg to offer them on the following advantageous terms:—Fine robust 4-year old plants, 8 to 10 inches high, 10*l*. per 100, or 30*s*. per dozen.

Fine Plants of CEDRUS DEODARA, 2ft. to 2ft. 8 ins., 10*s*. 6*d*. each.

Great Yarmouth Nursery, March 7, 1844.

STANDARD CURRANTS, white and red, trained on a single stem to a head, like Standard Roses.—Any Nurseryman having any to sell may direct to A. Z., Spencer's Library, No. 314, High Holborn, post-paid, stating size and price

1844.

All the common sorts of FLOWER-SEEDS not mentioned in the preceding List may be had in 3*d.* papers. If requested, W. & W. will mark each packet, whether hardy, half-hardy, or tender, to prevent wrong treatment.

PEAS.—Warner's Incomparable Large, late Marrow Peas, 2*s.* per quart; most delicious flavour, and great bearer. Gooseberry Lancashire, saved from prize Seed-fruit, 1*s.* do. Cabbage—Warner's new early Asparagus-flavoured, 1*s.* do. Fine Giant Asparagus, plants two years old, 3*s.* per 100, with printed particulars for planting. New Early American Potato, the earliest known; an excellent kind for forcing. Lancashire named Gooseberries, 9*s.* per dozen: and the New Grape Currants, 6*s.* per dozen. A constant supply of Hardy Herbaceous, Climbing, and Exotic Plants, including all the new and choice varieties. Potter's celebrated Liquid Guano, in quart bottles, with directions for use, 1*s.* 9*d.* each.

A General Catalogue of Garden and Flower-Seeds may be had on application by post, as a single letter.

PASTURE AND LAWN GRASSES of the Finest Quality, selected for every description of soil, consisting of Poas, Fescues, Gold Grass, Meadow Foxtail, &c., with a moderate supply of Clover, will enable Noblemen and Gentlemen to lay down upon very reasonable terms. Particulars of quantities suitable to various soils to be had, with an estimate of the cost per acre, by application to WARNER and WARNER, Seed-merchants, 28, Cornhill, London. Genuine Italian Rye-Grass, Mangold Wurtzel, and superior selected Turnip-Seeds.

PERENNIAL GRASS SEEDS.

SUTTON AND SONS, having for many years paid particular attention to the collecting of NATURAL GRASSES, and having been employed by most of the Nobility and Gentry of Berkshire, Hampshire, and Oxfordshire, to mix Seeds in proper sorts and proportions to suit the soils on their Estates, both for laying down new Pastures and improving old ones, have great confidence in soliciting orders from the readers of the *Gardeners' Chronicle*, in the more northern parts of the kingdom.

SUTTON and SONS have just published a Descriptive Table of Grasses, with some information which they consider would be acceptable to their Agricultural friends, and which may be had gratis.—The cost of the Seeds is very moderate, as will be seen by a reference to the Table above referred to.

Agents for Potter's Guano.

Reading Seed Warehouse, 7 and 8, Market-pl., Reading, Berks.

SEEDS.—Belgium Large White Carrot, 1*s.* per lb.; Mangold Wurtzel, Long Red, Orange Globe, and Red Globe, 1*s.* per lb. each; Le Couteur's Belle Vue Talavera Wheat, 11*s.* per bushel; Kintbury Skinless Barley, 8*s.* 6*d.* per bushel; Meadow and Pasture Grass Seeds in Mixtures, suited to soils, &c., at 32*s.* per acre; Mixed Sorts for improving old Grass Land, 1*s.* 3*d.* per lb.; Fine Sorts for forming Lawns, &c., 1*s.* 4*d.* per lb. Price Catalogues of Turnips and other Seeds are ready. Kitchen Garden and Flower Seeds.—GEORGE GIBBS AND CO., Seedsmen, &c. to the Agri. Soc., 26, Down-street, Piccadilly.

EXTRA CHOICE SEEDS.

WILLIAM MILLER has still some of his fine Hybridised FUCHSIA SEED, and being saved from all the fine sorts, will be sure to produce some novelties; and being anxious that every grower of Flowers should have some of this Superb Seed, he has reduced the Price as follows:—

Packet of 100 Fine Seeds	5*s.*
Packet of 50 ditto	3*s.*
Packet of Extra Select Calceolaria Seed	2*s.* 6*d.*
Packet of Extra Select Pansy Seed	2*s.* 6*d.*

The above will be sent Post-free; a remittance expected from unknown correspondents.

Providence Nursery, Ramsgate, Kent, March 6, 1844.

LAWN GRASS SEED.—Mixtures of the finest kinds of GRASSES and CLOVER, warranted to insure a fine Sward (allowing two quarts to the square rod), 14*s.* per bushel. Sent carriage-paid to London, in not less quantity than half a bushel. Mixtures for Lawns intended to be fed, 10*s.* per bushel.

JOHN RIVERS, Sawbridgeworth, Herts.

MELON SEEDS.

E. SPIVEY, having yet a few packets of his six superior kinds of MELON SEEDS, viz., BEECHWOOD (warranted genuine), DUNCAN'S GREEN-FLESH, EGYPTIAN, HYBRID PERSIAN, HYBRID CANTALOUPE, and a splendid long ribbed green-flesh Melon, to dispose of, will be happy to forward them as above, on receipt of a Post-office order for the sum of five shillings, made payable at Mildenhall, Suffolk.

E. SPIVEY, J. A. Houlton's, Esq., Hallingbury Place, near Bp. Stortford, Herts.

FLOWER-SEEDS.—The most Showy & Hardy known,

		£	s.	d.
in a Collection of 50 Sorts, with Instructions		0	12	6
Ditto	in 30 ditto	0	7	6
Ditto	in 20 ditto	0	5	0

The most Choice Sorts of Tender and Hardy Annuals, including most Superb German Asters, Stocks, Zinnias, Hollyhocks, Nemophylla discoidalis, Viscaria occulata, &c. &c. &c., in 50 Sorts — 1 1 0

Ditto, equally choice, in 30 ditto — 0 12 6

Messrs. SUTTON and SONS, growing almost every kind of Flower-Seed worthy of recommendation, are enabled to supply their customers with such New Seeds as will not cause the disappointment so often experienced in attempting to produce a constant supply of bloom in the Flower Borders.

N.B.—Parcels delivered free to London, or sent free by Post.—Agents for Potter's Guano & Whitney's transparent Composition.—Reading Seed Warehouse, 7 and 8, Market-pl., Reading, Berks.

G. CHARLWOOD, 14, Tavistock-row, Covent-garden, begs to inform his numerous Friends and the Public in general, that his Catalogue of AMERICAN SEEDS is now ready for distribution. In it will be found Cones of Pinus Douglasi, 21*s.* per doz.; likewise, his new General Catalogue, containing all the newest and most improved Vegetable and Flower Seeds; together with an abridgment of the same, containing the more select and rare Sorts.

He has likewise received his annual importation of German Stocks, Asters, Wall-flowers, Carnations, &c., &c. List with prices, will be found in the Abridgment.

G. C. having been many years in the habit of making mixtures of the different kinds of Grasses for Pasturage of all descriptions, can supply the same from 24*s.* to 36*s.* per Acre; or, in distinct Sorts, as may be desired. The finer Sorts, mixed for Lawns, at 1*s.* 6*d.* per lb. Also Lucerne, 1*s.* per lb. White Belgium Carrot, 1*s.* per lb. Altringham Carrot, 1*s.* per lb. Mangold Wurtzel, 1*s.* per lb. Yellow and Red Globe Mangold, 1*s.* per lb. Laing's improved Swedish Turnip, 1*s.* per lb. Skirving's do. do., do., 1*s.* per lb. All other Sorts of Agricultural Seeds equally low, and of genuine quality.

THE BRITISH QUEEN AND PRINCE ALBERT PEAS.

WM. JNO. CORMACK begs to call the attention of Noblemen, Gentlemen, and others, to the above two new Varieties, the merits of which are thus noticed in the *Gardeners' Chronicle*. "THE BRITISH QUEEN on light soils, is the best of all kinds, and will drive Knight's Tall Marrow out of the garden." "THE PRINCE ALBERT, which has been cultivated in the Garden of the Horticultural Society during the season, produced Peas fit for the table *ten days earlier* than any other variety sown at the same time." Both varieties may be had in packages at 3*s.* 6*d.* each, at W. J. C.'s wholesale Establishment, Newcross, or the Bedford Conservatory, Covent Garden.

NORFOLK ISLAND PINE—ARAUCARIA EXCELSA.

G. GIBBS and Co. have a few Plants of this beautiful and Ornamental Pine; they are handsome, and about 3ft. high. Price 6 guineas each. GEORGE GIBBS and Co., Seedsmen, &c., 26, Down-street, Piccadilly.

ZOCHER & SCHNEEVOOGT, Nurserymen, Haarlem, Holland, beg to state that they have just forwarded to their Depot the following FINE TREES:—New Dutch Red and White Grape Currants, 6*s.* 6*d.* per dozen; New Dutch Gooseberries, very large and fine-flavoured, 12*s.* per dozen. Red and White Antwerp Raspberries, 20*s.* per 100; Prolific, or Treble-bearing ditto, 50*s.* per 100.—H. C. CORSTEN, 359, Strand.

VICTORIA PARK.

J. MANDENO begs to acquaint the trade and public in general, that he has for sale the undermentioned ROOTS and SEEDS, in consequence of his land being required for the Victoria Park:—Very good two-year-old Asparagus Roots; superior two-year-old Sea Kale Plants: and the following Seeds, of most excellent quality:—Two-blade Onion, Cauliflowers, Red Cabbage, transplanted Red and White Turnip Radish, Solid Red Celery, White Celery, Curled Parsley, Spinach, &c., &c.; also Horse Radish Plants, and Licorice Plants.

Address to JOHN MANDENO, Grove Street, Hackney.

CUCUMBER and MELON-BOXES and LIGHTS.—For Sale, one, two, and three-light BOXES and LIGHTS, of all sizes, ready for immediate use, warranted of the best materials, packed and sent to all parts of the kingdom; two-light Boxes and Lights complete, from 1*l.* 8*s.* Garden-lights made, glazed, and painted, from 1*s.* per foot. Sashes and Frames made, glazed, and hung complete, 1*s.* 8*d.* per foot.—At JAMES WATTS' Sash Manufactory, 8, Claremont-place, Old Kent-road.

*** References given.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE & MORRIS will submit to public competition at the Auction Mart, Bartholomew-lane, on Thursday, March 21, 1844, and the following day, at 12 o'clock, about ONE THOUSAND STANDARD ROSES in fine condition, consisting of Bourbons, Hybrids, Perpetuals, Noisettes, &c. Also, a fine assortment of Dahlias in dry roots. May be viewed the morning of sale. Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

THE CELEBRATED SHEFFIELD BOTANICAL GARDENS.

TO BE SOLD BY AUCTION, by Messrs. SCHOFIELD and SON, (by order of the Sheffield Botanical and Horticultural Society,) at their Rooms, in the MUSIC HALL, Sheffield, on WEDNESDAY, 27th of March, 1844, at Four o'Clock in the afternoon, subject to conditions of Sale to be then and there produced.

The above magnificent, far-famed, and unrivalled GARDENS, PLEASURE-GROUNDS, PLANTATIONS, ORNAMENTAL PROMENADES, Noble Range of CONSERVATORIES and PROPAGATING HOUSES, FAMILY MANSION, CURATOR'S HOUSE, ENTRANCE LODGES, GROTTOES, FOUNTAINS, JETS D'EAU, and Superb Collection of TROPICAL and other PLANTS, FLOWERING SHRUBS, TREES, &c. &c.

It would be difficult, if not impracticable, to keep this announcement within moderate compass, and adequately describe the beauties and advantages of this attractive Property, which must be viewed to be fully appreciated. Without attempting a connected description, some particulars are subjoined:—

These GARDENS, of Freehold tenure, are situated on the south-west side of the town of Sheffield, about a mile and a half from the parish church, in the midst of numerous suburban Villas, surrounded by the most beautiful and picturesque scenery that even the *Neighbourhood of Sheffield* can boast of, are encompassed by high walls on three sides, the other being fenced off by a thriving hedge of Hollies, and are approached from the town along two Turnpike Roads. The extent of the Gardens and Pleasure Grounds exceeds 18 Acres of Land, which were laid out with most exquisite taste by the late Curator, Mr. Marnock, and have been improved and kept in order with great care and expense by Mr. Williamson, the present Curator. They consist of Lawns, Promenades, Shrubberies, Plantations, Parterres, Winding Walks, &c., ornamented in rich profusion by almost every variety of American Plants, Evergreens, Standard and other Flowering Shrubs of the choicest sorts, procured from the best Nurseries, all being in a state of the greatest luxuriance. To the southwest they are sheltered by an overhanging Wood of fine Old Oak and Forest Trees; and on the west and north by the Conservatories and other Buildings. A Reservoir, Pond crossed by a Rustic Bridge, Jets d'Eau, Artificial Caverns, Grottoes, Swiss Cottage, &c., have been formed and built in various parts of the Grounds for the amusement and gratification of the Visitors.

The CONSERVATORIES have also been erected with great taste and skill near the Western Boundary of the Gardens; comprising CENTRAL HOUSE, with Dome top, 35 feet high, 60 feet long, and 30 feet wide, Two WINGS and three INTERMEDIATE HOUSES, extending 300 feet in length, and fronted by a spacious TERRACE and the GRAND PROMENADE, commanding a Panoramic View of the surrounding Landscape. The Central House is filled with rare and superb specimens of Palms, Strelitzias, Screw Pines, Pandanas, Dracœnas, Ficus, &c; and in the adjoining Houses is a Fine Collection of Orchideous Plants, Exotic Ferns, &c. The Wings contain Orange and Lemon Trees, Myrtles, Banksias, Camellias, Rhododendrons, Acacias, &c., of various kinds. In the two other Houses are large Collections of Ericas, Azaleas, Camellias, Geraniums, Cactuses, and hard-wooded Plants, from the Cape of Good Hope, New Holland, and other Countries. The Houses are partly heated by hot water and partly by warm air. Behind the Conservatories are open Sheds, Furnace and Boiler Room, and Carpenter's Shop, and at a short distance therefrom are several Frames with a row of PROPAGATING HOUSES, 80 feet long, divided into four convenient compartments.

The MANSION, now in the occupation of Mr. Cammell, stands near the upper part of the Grounds, with private way from the high road, presenting a handsome elevation of two stories, is built of well-dressed Stone, and although moderate in size, is adapted for a Genteel Family. The DWELLING HOUSE, occupied by the Curator, is contiguous to the Conservatories.

The PRINCIPAL ENTRANCE to the Gardens consists of a Magnificent Archway, of rubbed Stone, with Iron Gates; there being on one side Apartments for the Lodge Keeper, and on the other a Committee Room, and near thereto a Yard and Sheds for the standing of Carriages and Horses.

Mr. WILLIAMSON will show the Gardens between the hours of Ten in the Morning and Four in the Afternoon, of any day, Sundays excepted; and further Particulars may be had on application to the Auctioneers, or at the Offices of Messrs. WHEATS and STANIFORTH, Solicitors, Sheffield.

A CATALOGUE of the PLANTS, &c., may be seen at the GARDENS.

RANUNCULUSES, ANEMONES, PELARGONIUMS, AURICULAS, CARNATIONS, AND LILIUM LANCIFOLIUM.

H. GROOM, Clapham Rise, near London (removed from Walworth), by APPOINTMENT FLORIST TO HER MAJESTY, begs to inform the Nobility, Gentry, and Amateurs, that, in consequence of the success he has had in the cultivation of the above flowers at his new Garden, he can offer them at very moderate prices. He would particularly recommend an early application to be made for RANUNCULUSES and ANEMONES, as they should not be planted later than the end of March to ensure a good bloom. His Catalogue of PELARGONIUMS, AURICULAS, and NEW PLANTS, is now ready, and will be forwarded by post on application. The Trade supplied.

MELON SEEDS.—A very liberal Remuneration will be given for some PERFECTLY PURE AND GENUINE SEEDS of the under-named Melons, or Seeds procured the last year direct from China, Cabul, and Candahar, will be given in exchange:—Striped Hoosainee, Daree, Geree, Gernula, Melon of Gerger, Nukshevan, Sweet Melon of Ispahan, and Italian Green-flesh.

Application to Mr. G. MILLS, Gardener, Gunnersbury Park, Acton, Middlesex.

The Gardeners' Chronicle.

SATURDAY, MARCH 9, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, March 13	Society of Arts	8 P.M.
TUESDAY, March 19	Horticultural	8 P.M.
	Linnæan	8 P.M.
WEDNESDAY, March 20	Microscopical	8 P.M.

"WITH the exception stated below, trees imbibe from every part of them which is exposed to moisture, and give off (transpire) from every part of them which is exposed to drought. The root is the part which is constantly exposed to moisture, and which furnishes the constant supply of sap to the tree. That part of the root which is universally believed to imbibe no moisture, the woody part, is the only part which does imbibe moisture; *and that part of the root which is universally believed to be the only part which does imbibe moisture, the unripe ends or fibres, is the only part which does not imbibe moisture.*"

Such is the startling declaration of Colonel Greenwood, whose book on planting we noticed a fortnight since (p. 118). On the one hand, it is the opinion of a man who has evidently paid attention to practical foresting, and has indulged in the good habit of thinking for himself; on the other, it is entirely opposed to the views of preceding writers, and strikes at the root of some of the most solid observations in vegetable Physiology. It has, therefore, a double claim on our attention.

We will not stop to inquire at what time the term "spongelet" was first applied to the young and tender points of the roots of plants. It will be sufficient to state that, with the exception of a few ill-informed persons, who fancied the spongelets were special organs, everybody from the days of Duhamel up to those of Colonel Greenwood, has recognised in those spongelets the most powerful of the absorbent parts of plants. Senebier, a Swiss physiologist, proved the fact by the following experiment:—"I placed," he says, "in water, a plant of Radish, inserting only the point of the root; it remained fresh for many days. I bent the root of another Radish, without breaking it, and plunged the curved part in water, so that the leaves and the point of the root were above the edge of the vessel employed: the leaves at first flagged, but as soon as the point of the root was introduced into a tube of water, they recovered their original freshness. I repeated the same experiment, with similar results, on several other plants, having roots flexible enough to be bent, and sufficiently clear of side rootlets, to render the experiment trust-worthy."—*Physiologie Végétable*, vol. i. p. 311. Duhamel had previously remarked that many plants suffered more from being planted under old Elms when they were 4 or 5 feet off than when they were close to the trunk; "because, at the former distance the fine fibres of the Elms were able to exercise their sucking force, while, near the trunk itself, the old roots were inactive." This in fact is so well-known a circumstance, that it could hardly have escaped observation, if Senebier had never published his Physiology. Let us take a few instances about which there can be no doubt. In a fruit border the wall trees become too luxuriant; the gardener cuts off the points of the roots where the great act of absorption is going on, and so for the moment checks them. An old tree is exhausting the soil; where is manure added,—round the trunk, or by breaking up the soil at a distance from it, and introducing the manure at that place? We think there is but one answer to that question. It is true that we have seen ignorant people pouring water round the trunk of an old tree, in the summer, in the hope of reviving it; but they might almost as well have poured the water in another county. And again, we all know that plants which are growing in pots may be transplanted at those seasons with safety, when no precautions would enable the same plants to live if taken out of the ground. In that case, the preservation of the young and tender roots is undoubtedly the explanation of the uniform success attending pot-transplanting in summer.

But experiment is hardly necessary to show that the young and tender fibres of plants are the most powerful of their absorbing surfaces. It is an undoubted law that all vegetable tissue allows water to pass through it with a facility proportioned to its youth. The younger is vegetable tissue, the thinner it also is, and the more easily penetrated by fluids. As it grows old it thickens, hardens, and even dies: and with that thickening, hardening, and dying, does its power of transmitting fluids diminish. The youngest parts of the roots of plants are the spongelets; next in age is the part behind them, or the small fibres; and the oldest are the large thick roots; therefore the most absorbent are the spongelets, next the smaller fibres, and last the large thick roots.

Let it not be supposed from these statements, that we deny all power of absorption to the surface of old roots; on the contrary they no doubt do absorb to a certain extent; and Col. Greenwood is right when he says that "trees imbibe from any part which is exposed to moisture." But the question is not, whether the roots of plants absorb by their points alone, or by their old surfaces; it is, whether they absorb fastest by the one or the other: and to that there can only be one answer. Col. Greenwood says that in transplanting "the supply must be equal to the demand; if not, scarcity will ensue:" and nothing can be more true; it is the fundamental axiom of transplantation. And that being so, it is obvious that the supply of food to plants will be greatest where the most powerful absorbing parts are preserved. Those parts are the tender fibres and their spongy extremities.

It is superfluous to examine the evidence produced by Col. Greenwood to prove that all parts of plants in contact with moisture will absorb it, because nobody denies that fact. The true question is, which parts will absorb it fastest, so as to ensure a supply equal to such demand as may be made? Physiologists say the spongelets; Col. Greenwood undertakes to prove that "roots do not imbibe at all from the small sponges (spongioles) which are *supposed* to exist at their ends." Let us consider the nature of his proof.

He begins, as will be seen from the passage just quoted, by denying the very existence of spongelets. But we presume that fibres must have an extremity; as they grow by additions to the extremity, that part must be the youngest; and as spongelet is merely the technical name of the young point of a root, a spongelet must have a real existence. We may therefore consider the existence of spongelets to be sufficiently proved. The next argument is founded upon the roots of Horse Chesnuts growing in water. It was found that "where the root was cut off when several inches long, the plant would still grow, and would continue to throw out fresh roots as fast as they were cut off." But this proves nothing further than that the Horse Chesnut seed, when in contact with water, is capable of absorbing fluid fast enough to live until the loss of the rootlets can be repaired. It surely does not prove that the young fibres had no action. Then it was found that "if the plant was divided from the seed, by cutting the *umbilical bands*, it died, though the root was perhaps twice the length of the plant." We are not sure whether we understand what is meant by "umbilical bands;" but if the bases of the seed leaves (cotyledons) are intended by the expression, we still find no proof in support of Col. Greenwood's theory; for we all know that seedlings are incapable of living in the absence of their cotyledons. The experiment shows that roots cannot live in the absence of leaves, or their equivalents, which the cotyledons are; but by no means that the young fibres of roots are useless.

Beyond this experiment we find nothing in Col. Greenwood's book in support of his novel views, except the well-known fact that trees may be transplanted successfully when the fibres are for the most part cut off. In those cases, however, it will be found that, in the first instance, the wounded ends themselves absorb fluid until the organisable matter lodged in the vicinity is called into action and has formed fresh fibres. And the notorious danger of trusting to the transplanting of trees with greatly mutilated roots lies in the chance that the leaves will draw upon the roots for fluid faster than the roots can provide it, and that thus the supply should *not* be equal to the demand.

Let no one therefore imagine, because it is possible, under very favourable circumstances, to transplant trees with few small fibres attached to them, that it is a practice which can be in any way recommended for adoption. We must never neglect the probable, from a blind reliance upon the possible.

BARRENNESS IN THE FIG.

MUCH inquiry has taken place lately about the management of Fig-trees in our moist climate, and I do not wonder at it; for of all our fruit-trees the Fig seems most difficult to bring under system. When, however, the bright and dry climate of the East, where it is indigenous, is taken into consideration, and compared with the climate of Britain, together with the rapidly-absorbing powers of both the roots and leaves of this plant, the wonder will be much diminished.

Short-jointed wood is allowed on all hands to be the criterion of fruitfulness in most fruit-trees; this is particularly so with the Fig, and of course is quite incompatible with luxuriance. Now, few persons that have any practical knowledge of its habits will venture to put manure of any kind within its reach in open-ground culture; animal manures, especially, are entirely out of the question. However, it is not enough to refrain from the use of manures; even plain loam, with liberty to range, is by far too powerful a stimulant for the average heat of our summers. I have some Fig-trees on a south wall that were old trees when the following detail of operations took place: they had grown with excessive luxuriance for many years, and seldom bore fruit; the leaves were twice as large as they should be, and the internodes between the buds on the young shoots were from four to six or eight inches in length, whereas in fruitful Figs the internode is sometimes barely perceptible. These Fig-trees, in consequence of alterations, had to be removed, and when they were replanted I placed a temporary wall at two feet distance from the trees, and filled the inclosed space with maiden soil—not the turf, but taken from under the turf; and in addition to this, I formed a substratum of bricks, allowing only nine inches of soil in depth. The Figs were taken up in November, and laid in amongst some rubbish until the end of March; it had been a most severe winter, and the trees when planted were to all appearance nearly dead—the bark was much discoloured. However, they grew after some weeks, and they are now again too luxuriant, although they have borne much better since the operation.

From this, and many other observations I have made for years, I have no doubt that it would be much better for the Fig out of doors, as well as for some luxuriant Pears, to mix a very considerable portion of stone, in masses of some size, with the soil, when the border is prepared. I should think that equal portions of sound loam, rough lime-rubbish, and masses of stone, trod well together when dry, would be an excellent compost for Figs, or even for many tender Pears. The rapid action of the root must be impeded by some means—and what more in accordance with nature than acting thus on the texture of the soil? If this were done, we should not hear so much about disbudding and systems of pruning. The Thorn-tree, with its profusion of fruit, ought to teach us a lesson—growing, perchance, on a solid and shallow bank of dry soil; here the annual growth is in proportion to the light and heat of the climate, and the consequence is, extensive and perfect elaboration of the sap.—*Robert Errington.*

ON TRAPPING VERMIN DESTRUCTIVE TO GAME.

SOME gardeners have to act as gamekeepers, especially those who are employed by gentlemen whose incomes are too small to allow them to keep men for the sole purpose of preserving or of killing game. Though many gardeners can kill, yet they sometimes cannot preserve game; that is to say, they do not know how to destroy vermin. To such, a few remarks on the trapping of vermin that destroy game may be useful,

They are generally taken in what gamekeepers in the north call "wears." A wear is only a few twigs stuck in or laid on the ground around a bait and a trap, so that the animal to be taken cannot reach or take away the bait without going over the trap. When a wear is against a wall, fence, tree, or bush, it is usually in the form represented in the accompanying figure. If it is made in an open field, it is oval. I have said that a wear is made of twigs, but it must be made of whatever is about the spot on which the bait is laid, whether it is Chickweed, Ragweed, Ling, bushes, or rotten branches. A wear, about a foot long, 9 inches broad at the back or wall, 6 inches at the mouth where the trap is set, and 6 or 7 inches high (uncovered), is large enough for the polecat, weasel, &c.; but one to entrap a fox ought to be 2 feet long, 18 inches broad at the back, and one-third narrower at the mouth.

Almost all sorts of carrion may be used as baits, which ought to be pegged down; the traps should be covered with the same material as that amongst which they are set; that is to say, if they are placed on sand they must be covered with sand; if on Moss, with Moss; or if amongst rotten branches, with them.

The Fox is exceedingly wary and subtle, and avoids everything that has any appearance or shadow of danger. On the side of an avenue or in a strip of plantation, if there is a foot-path running from the one end to the other, it is a good place to form a wear for this animal. He may also be taken in wears near rivers, streams, standing water, spongy marshes, or Furze covers: and without wears, by hanging a bait against a wall, fence, or tree, within his reach, and setting a trap 15 or 18 inches from the wall, &c. Several traps around the mouth of his hole or "earth" may likewise take him in going in; and if it is certain that he is in, a trap ought to be set inside, and a few branches put over the mouth of his "earth," that he may come upon the trap before he is aware. If the hole is not darkened, it is probable that he will come out under the trap. When it is known which way he comes from his cover, the best plan is to fasten a bait of an animal that has been some time dead, so that the effluvia may be smelt at a distance, to a stick or string, and trail or drag it round a field, and then into the centre of it, where the bait ought to be half buried, pegged down, and three traps set around it. This plan is often attended with success. Foxes, badgers, and other vermin are sometimes taken in pitfalls, but as it requires a little time and labour to make them, and as men and cattle may fall

into them, I shall not recommend them for anything but for the domestic cat. The best places to dig pitfalls for foxes are near his "earth," and on a path that goes from one plantation or cover to another.

The Polecat, Stoat, and Weasel.—These vermin can be taken in wears, boxtraps, and counterfeit or false burrows. Wears should be near rivulets, large heaps of stones, old walls, or rubbish of any kind. Where two walls or fences join is an excellent place for a boxtrap. In the absence of a boxtrap, four boards, wide enough to let common traps spring, may be nailed together, and made to pass through a wall or fence, and common traps set at each end of it with a bait in the middle. Traps placed at the entrances of their holes, or against holes in stone fences through which they pass, will take them. False burrows should be made at the bottom of hedges, &c. By hanging baits against walls, banks, fences, and gateposts, and placing traps under them, they may be taken. Almost all vermin that destroy game often pass through gates.

The House or Domestic Cat will put her foot on an uncovered trap to reach a bait on a gatepost. Puss is easily taken in wears; but by using "a charm" she is much more easily captured. This charm is the root of the shop Valerian (Valeriana officinalis). One writer on British plants says that "cats, and especially rats, are fond of the roots of this plant." Another says that "cats are powerfully affected by the odour of them." This root is powerfully attractive; insomuch, that if sixpenny-worth were put into the foot of a stocking, and hung over the mouth of a pit-fall for a few nights, a great number of cats might be taken. About as much of this material as can be held between the finger and thumb, put into a box-trap, will entice a cat to go into it; and if it is placed at the bottom of a 32-sized flower-pot laid on its side, poor puss will put her head through the noose of a snare in order to reach it.

The Carrion Crow and Magpie.—These birds can be entrapped in wears. The most likely places to make them are near pools, spongy places, running water, on sides of rocky hills, and in open fields. In spring, and the beginning of summer, eggs ought to be used as baits, and carrion during the rest of the year. A very good way to take them is to fix a dead cat, rabbit, or an egg in the cleft of a stick, and put it in a pool or pond, or standing water, within 4 inches of the edge, where a trap should be placed, and well covered. If the edge of the pool does not answer well, a narrow turf-bridge 15 inches long should be made, on the extremity of which a bit of flesh or an egg ought to be laid, to entice the bird to walk over the trap. A dead sheep or lamb is excellent bait for carrion crows. This should be placed in an open field, and traps may be set within 6 inches of its belly and eyes. If it is likely that there will be more than one crow at the bait, it is advisable to place traps on the little hillocks that are near it; for when one crow is trapped the others hover above it for a little, and then alight on these hillocks. By these means may be taken all animals that are destructive to game.—*A. Pettigrew, Wrotham Park Gardens.*

FAMILIAR BOTANY.

MORPHOLOGY, No. VI.

(Continued from page 133.)

"Lift up the eye of faith and thou wilt see
The clear blue sky of the untroubled heavens."

HAVING now cleared away the historical matter which seemed necessary in order to introduce Morphology to your readers, I shall henceforth discontinue all reference to the opinions of individuals, and confine myself to an explanation of what appear, at this day, to be the facts of the case; and for the better doing so I shall begin with the beginning.

Of all the prodigies with which science brings us acquainted, nothing can be compared for interest to the TRANSFORMATIONS OF ELEMENTARY matter. They are so surprising, so difficult to observe, and so entirely unlike what the untaught sense is conscious of, that they are among the last things whose truth reason and evidence succeed in impressing upon the human mind. The Pitt Diamond is valued at the sum of 100,000*l.* This mass of precious adamant is composed of the most valueless material; of nothing better than human breath, solidified by the operation of unknown forces. There is no resemblance whatever between the two substances; fancy cannot paint any two things more entirely dissimilar than human breath and diamond. Nevertheless, they are the same, and beneath the mere action of heat the gem loses its solidity, and is expanded into human breath again. What is, if possible, still more surprising, it was plants which stole from animals the matter of this gem, which, beyond all doubt, is a condensation of charcoal. It, the most brilliant, and most solid substance in creation, is a transformation of one of the most opaque, porous and uninviting materials that we know of. Charcoal itself is but a piece of wood deprived of its water. Here is one great Morphological fact. If you ask why this thing is so, and inquire where the force resides that impressed such properties on matter, the only answer is an appeal to the Most High.

Go into the laboratory of the chemist. He will show you a bottle of air or gas labelled O, and called oxygen; another labelled H, and called hydrogen; a third marked CO_2, and called carbonic acid. These are neither to be seen, smelled, nor felt. They wholly escape our ordinary senses. You would never believe that the bottles contained anything. But you find that a match burns brightly in O, sets H on fire, and is extinguished by CO_2. It is, therefore, evident that the bottles do contain something, although the ordinary powers of perception may fail to detect it. Out of matter like that contained in these bottles are plants composed. Yes, the solid, opaque, touchable, visible, fabric of a plant is a transformation of the transparent, untouchable, invisible materials in those bottles. H and O go together and form HO, which is water, the most important and common of all forms of fluid matter; by their union they become visible and touchable; their original qualities are changed: the new compound will neither catch fire like H, nor assist a match to burn like O, but is the sworn enemy of fire in every form. If you doubt this fact the Chemist will separate water for you into its original elements, and H will burn, while O will assist to burn, just as before.

In like manner CO_2 is, by the chemical processes of separation, found to consist of the O already brought on the stage, and C, which signifies charcoal (carbon), so that although soot and all such matters are both opaque and soft, yet they consist in reality of the transparent O and the adamantine matter of the diamond. What can be more strange than this metamorphosis?

But others quite as singular have to follow. The green, the red, the white, the blue of vegetation, the iron trunk of the Oak, the tender mucilage of the Starjelly, the gum, starch, and sugar that nourish us, the many vegetable products that heal our diseases, or cut us off by their poisonous qualities; the soft, the hard, the dry, the moist, fabrics that constitute the solid masses of the vegetable kingdom, are little more than compounds of the H, O, and C already mentioned. For example, 9 parts of H and O, and 12 parts of C go together and form sugar; then if two parts of H and O are added we have gum; a much smaller change produces starch; and the dry unchanging woody texture of a tree only differs from the sugar that is so soft and nutritious, in having a little less of H and O in its composition.

Metamorphoses like these—and there are hundreds of them—give rise to the whole of the infinitely varied products of the Vegetable Kingdom. When the Frenchman is sipping his *eau sucrée*, he is indulging in a feast of charcoal and water; when the laundress views with admiration the magical effects of starch upon her mistress's ruffs and laces, she only does homage to the effects of charcoal and water; the sailor, whose pride is the wooden walls of Old England, is still but a worshipper of charcoal and water; the prince who exchanges his forests for diamonds is a barterer of charcoal for charcoal, and, finally, the whole Vegetable Kingdom is little more than a metamorphosis of charcoal and water in countless masquerading forms.

Such are the elementary changes that science recognises in the matter out of which the tissue of plants is constructed. We shall next see that the many forms of tissue are again metamorphoses of but one simplest type.—*R. E.*

Home Correspondence.

Diseases of Plants.—In treating of the "Diseases of Plants," you say, at p. 99 (Feb. 7), "The medical man divides diseases into *functional* and *organic*, and under the former head places all those diseases in which he cannot detect an alteration in the structure of the diseased organ; but this arises from his want of the power of observing the minute changes of structure on which the diseased function depends. There is no such thing as function independent of structure, and there is no evidence to prove that a function can be deranged whilst the structure is quite perfect." Such a proposition as this should not be allowed to go without some qualification; and it would be well that such an authoritative dictum should not be made to prejudice your readers against one of the most useful maxims, and best rules of guidance, in the practice of their medical advisers. It is true that this useful division of diseases into two great classes is in part conventional, and standing in the stead of a more exact knowledge of the proximate cause, or to speak more popularly, the exact and essential nature of the change in the condition of an organ, which we call disorder or disease. But it is quite as gratuitous, in the present state of our knowledge, to assume, that the action (for that is function) of an organ may not vary, without change of structure; or that the simultaneous action or function of parts (for that constitutes health or disease, as the case may be) may not lose their consentaneousness without such change. Neither proposition, perhaps, is capable of direct and positive proof, and your columns are not the place for a lengthened discussion of the subject; but I will endeavour to show, by a little analogy, that the doctors have some reason on their side. The animal body is composed of many organs, the consistent and harmonious working of which constitutes healthy existence—life; in its best sense—*ease*. If this harmony is disturbed, if any, or all of these organs are unduly worked, or if any one, or some, or all are idle, the healthy current of existence is disturbed, and disease is the consequence. Now, the actions or functions of the several organs depend on certain moving powers, derivable mediately or immediately from the nerves and blood-vessels; and it may happen, and often does happen, that these moving powers are unduly and irregularly supplied, and thence comes derangement of the animal machine, loss of healthy action, and disease; just as an inanimate engine, or a part of it, may be overdone, or underdone, by its moving power, be it steam, or wind, or water, or any other, and a stoppage, or a derangement, of its ordinary or proper function induced. In such a case it is evident the stoppage, or disordered action does not depend on any organic change, or structural fault; the moving power, and the object to be set in motion, are unequally balanced, and the machine works badly, or is stopped. Take another analogy (for such similitudes will perhaps be better understood by your readers who are not apt to be very well acquainted with the physiological, or pathological workings of their animal machines), and compare the healthy condition of the animal body to a well-tuned and well-played musical instrument. With the due and appropriate application of the moving power, all is harmony and ease; put the same instrument into the hands of an unskilful artist, let the moving power be unduly distributed, let its various parts be unduly and unartfully animated, and all is discord and disease. To bring the matter more home:—we will suppose a healthy person just about to sit down with a good appetite to his dinner; he is told that his banker, in whose hands he has a large deposit, has stopped payment, and he sends his meat away untouched. Or suppose the happy father of a family, easy in his circumstances, and in the enjoyment of excellent health, having just taken a hearty meal, is told that his eldest son at college is lying at the point of death, and the first immediate effect is, at the least, a fit of indigestion. In both these cases there is functional derangement without change of structure; reverse the picture to either of these persons, their functional powers and appetites return; or, in other words, the motive power within them operates in its proper channel, and their disease is at an end. Still more to the point:—there are innumerable cases on record where the functions of particular organs have been disturbed for years by what was called sympathy (now more correctly the reflex action of nerves), and have been immediately restored by the removal of the remote excitant cause. In such cases there could not be any structural derangement. Notwithstanding all I have said, I still concede to you, that there is no function independent of organism. I only maintain, that there may be disorder without lesion of parts, or change of structure; and that till we know more of the proximate changes of the vital actions (vital Chemistry, I might have said) we have reason to abide by a distinction as philosophical as it is convenient—so convenient, that I bet my best Melon, of the forthcoming summer, to "L. E.'s" best bunch of Grapes (the good English method of settling a dispute), that he will by-and-by, when he treats of the diseases of plants, produced by too much or too little nutriment, too much or too little warmth, and so forth, use the distinctions, and perhaps the phrases now in discussion. In the foregoing illustrations of my position, I have not overlooked the objection which will probably occur to the able writer of your "article," that a change may take place and does take place in the vascular system, and the distribution of blood in the disturbed organs; and this he will say is tantamount to structural change. I have provided against this by admitting the agency of that fluid as a motive power. More may be said to meet this objection; but your readers will probably think there is enough for the present.—*M. D.* [We must still maintain that our position is correct. "M. D.," in his own instances, shows clearly that there must be derangement of structure to produce functional disorder. The *convenience* of the term functional disease in medicine we admit, but we deny its *correctness*. We shall endeavour in all cases to point out the structural change on which the decayed functions of plants depend.—*L. E.*]

Ward's Cases.—The following is a drawing of a "Ward's case" of my own designing and making. It has been filled with a great variety of plants for some time past, and they all seem to enjoy their position. *a a a* is the frame or case which contains the soil in which the plants are placed; the central pillar, *b*, has a creeper twining round it. The house itself is ornamental, and particularly suitable as a "Drawing-room Greenhouse." It seems to require very little care except occasionally picking off decayed leaves. The shape is exceedingly light and simple, and it can be made even more so by the omission of the arches and "tracery" marked *c*.—*J. L. Snow, Swinton Gardens.*

The Fastolff Raspberry.—I obtained in 1842 some canes of the large sort of Raspberry mentioned by "Fair Play" as growing at Filby, and at the same time some of the Fastolff from Messrs. Youell and Co.; the latter proved far superior both in size and flavour of fruit, the canes growing to the height of nine feet and literally covered with fruit.—*Justice, Liverpool.* [We have this correspondent's name.]

Cucumbers.—For two years past I have entirely discarded the old method of growing Cucumbers on dung hot-beds, or of allowing them to grow on the surface of the soil at any time. I find that by training them to trellises I have not half the trouble with them that is required by the old plan, and that the plants continue much longer in bearing when so treated. I have had plants in this way continue in a bearing state and in perfect health for upwards of twelve months, and it is very seldom we are without Cucumbers here all the year round. We have at this place a range of pits about a hundred feet in length and nine feet wide inside, heated with two

rows of hot-water pipes along the front and both ends; the lower or return pipe lies in a trough made of bricks and Roman cement; this can be filled with water so as entirely to cover the pipe, that it may raise a constant and powerful steam in the pit when required. Besides Pine-apples, in this pit I grow Melons, Cucumbers, and various other things. Instead of brick partitions I have movable wooden ones, which I find very convenient. By this means I can easily enlarge or reduce the size of each compartment to suit exactly the purpose it may be wanted for. Suppose that in next autumn I shall have fruited off a number of Pines, and consequently have three or four lights to spare, I shall begin to prepare for a winter crop of Cucumbers. After throwing out all the tan, and fixing in a partition of boards, I next build a temporary wall of loose bricks lengthwise, about four feet from the front wall, and fill up the space with tan for bottom-heat. When the heat is risen to the proper degree for putting in the plants, the soil is put on in little hills at first, and the trellis is fixed in its place, in which is left an open space at the back, in one of the corners, about two feet square, for the purpose of going in to regulate the plants. This is very easily accomplished by pushing down the light and having a short ladder to step upon; the laps in the glass are puttied perfectly close, and for at least four months in winter no air whatever is admitted, and the plants receive very little water,—say once in a month at most,—and then only a small quantity is given them. In pruning up the centre of each light I generally take only a single shoot, which pushes out its bearing laterals throughout its whole length, and this covers the whole surface of the trellis under the light. Should any accident happen to the main shoot, a lateral brought into its place will soon fill up the vacancy. With respect to the sorts most worthy of cultivation, I have tried a good many of the most famed varieties for three years past, and I find they differ widely, both with regard to bearing and hardiness. The true Sion Cucumber is the kind that I prefer before all others for general cultivation; it is a hardy and prolific bearer, and answers either in winter or in summer for pot-culture or for planting out in beds. Of the long kinds the best I have met with is one that was sold in London two years since, under the name of the Superb White Spine; it is hardy, and a good bearer. I had three lights of it last year, which kept in bearing for 12 months, and would have borne longer if they had been allowed. It frequently grows from 22 to 26 inches long, and is a very handsome-shaped fruit. From one plant of this growing in a box standing on the footpath in a corner of the Pine-stove, I have cut, since the middle of January, seven brace, averaging 18 inches in length each. The black-spined sorts appear to require a stronger heat, and are of a more rambling habit than those that are white-spined; but I have just now in bearing three lights of Latter's Victory of England, which seems to be a very hardy sort, as well as a handsome and prolific bearer; it is the best black-spined Cucumber I have yet met with. —*Robert Reid, Noble Thorpe.*

Inscriptions.—In order to clear a stone slab of Lichens, place the stone face downwards on the ground, if convenient; but if that cannot be done, cover it with loam or soil—the richer the better. If the stone should form part of a wall, this may, nevertheless, be done by fixing a board a short distance from it, and filling up the space with soil. In Scotland, grave-stones may be frequently seen lying on the ground, face downwards, for the purpose of destroying Lichens and rendering the inscriptions legible.—*Y. G. H.*

Yeast.—We have received three recipes for making yeast, from different correspondents. One informs us that the following never fails to make light good bread:—Mash about two quarts of malt in a gallon of boiling water, and let it stand about two hours, then skim it off into another small tub, and when it is sufficiently cool, add a table-spoonful of yeast, which will produce a sufficient quantity for a large baking. Repeat this whenever you want a fresh supply, always keeping a little of the former yeast to make the next work; the process is the same as brewing, only without adding Hops, or boiling the wort. If the weather is very cold it may require to be put by the kitchen fire to make it work. Yeast will fall to the bottom of the tub, besides that which rises to the top.——Another states that eight gallons of excellent yeast may be made as follows:—Take ten gallons of water, and half a pound of Hops, boil them for two hours, then strain the liquor into a tub, and stir in half a peck of ground malt, mix them well together and stir occasionally; let it stand until blood-warm, then take one gallon of yeast, from the brewer at first, and afterwards from the remains of your own stock, with two pounds of flour, mix all together, and let it work eight hours, then stir it up, and strain into a barrel, and keep it well corked. The result will be about eight gallons, which has an appearance between that of thick beer and thin yeast. The method of using this yeast for the manufacture of 35 stone of bread is as follows:—Boil one and a half peck of Potatoes, mash them well and strain them, add about one and a half gallon of cold water, mix them well together, then one gallon of the above patent yeast, with two pounds of flour, stir up well, and cover down for five hours prior to setting sponge, which will be ready in seven or eight hours, according to the weather; great precaution must be used in taking the sponge at the first or second fall, in order to get the bread sweet. The dough must not be allowed to lie longer than an hour in hot weather, but put into the oven as soon as possible. This will be found to surpass any brewer's yeast that can be made, if properly used. This receipt is on a large scale, and will, of course, have to be proportionably divided for domestic use. If a smaller quantity be made, viz., a gallon or two, it will, if in a stone bottle, tightly corked, and put in a cool place, keep good for a long time. ——A third communication says:—Boil one ounce of Hops in four quarts of water until the Hops fall to the bottom of the pan, strain it, and when milk-warm, add six ounces of flour and five of sugar; set the mixture by the fire, stirring it frequently; in 48 hours add four pounds of potatoes, boiled and bruised fine; next day bottle the yeast—it will keep a month. One-fourth of yeast, and three of warm water, is the proportion for baking.*** [We have tried this, and find it a good substitute for yeast. A fourth communication on this subject very nearly agrees with the last.]

What is the best Temperature for the Pine-Apple?—We are always best answered if the reply to our queries can be obtained from Nature; and the reply, therefore, to the above query shall be from observations made at Calcutta. In the vicinity of that city, the yellow-fleshed Pine-apples are high-flavoured, and commonly weigh between 5 and 6 lbs.; and Mr. Speede, in his "Indian Hand-Book of Gardening," says (p. 183) that, by a system of very ordinary cultivation, his brother grew them weighing 7½ lbs. This was, of course, when the plants were exposed to a climate of which the following Table shows the monthly averages of temperature taken at the hottest and coldest periods of the 24 hours. Now, although Pine-apples may be obtained nearly all the year at Calcutta, yet their period of greatest perfection is from April to September. This may be termed their ripening or stove period; and it will be found, upon referring to this Table, that the average maximum temperature of that period is above 91°, and the average minimum more than 79°:

	J.	F.	M.	A.	M.	J.	Jy.	A.	S.	O	N.	D.
Max. Temp.	84.5	90.	90.5	97.	95.	91.5	88.	87.	90.	91.	85.5	81.5
Min. Temp.	60.	65.	71.	77.5	78.5	81.	80.	80.	80.	75.	64.	57.

I may just observe that the above are average temperatures, and that the Pine-apple in Bengal often has to endure such widely-differing temperatures as 129° and 53°. From these facts I conclude, that if in England the temperatures each month never ranged higher in the Pinery than the minimums in the above Table, they would not be too high in proportion to the diminished light of our latitude.—*George W. Johnson.*

Larch and other Resinous Trees.—In a late Number are some observations by "C. Wren," on an article of mine, p. 61, on the propriety of felling Larch for durability in the early part of summer. The words, "June is the best time to fell resinous trees for durability," require explanation. What I intended to say was this: "My friend—an experienced person—says they should be felled just when the sap begins to be fluid, in spring before the first buds and leaves are expanded, as the resinous fluid is more regularly dispersed in the wood" (perhaps by being more miscible, and filling up the pores—at least he said the timber was better from that circumstance.) This brings the time I intended to state for felling such trees to the period "C. W. H." proposes, viz., in March. I then inquired if such were the fact, and could it be corroborated by other experienced persons? As the sap or resinous fluid remains in Larches in a dormant state all the winter, viz., in the state in which it was deposited at the end of the previous autumn, it cannot have undergone much change, if any, before the buds and leaves have expanded; therefore there can be no doubt but early in spring is the best season for felling such trees, but whether just before or after the sap begins to be in motion, requires to be proved by accurate experiment—I am inclined to think after. The best time to prune resinous trees, to prevent bleeding, is soon after the sap is fixed, late in autumn or early in winter, or else after the first buds and leaves have expanded in spring, but by no means when the sap first begins to flow in spring.—*W. Billington.*

Preservation of Wood.—In a late *Chronicle*, "A Subscriber" asks for information about Burnett's Antiseptic Solution. This is the chloride of zinc, patented by Sir William Burnett in 1838, and which has been very successfully tried at the Woolwich Dock Yards, and is now becoming adopted in the navy. It has been found superior to Kyan's Patent Solution, the chloride of mercury. The solution of the chloride of zinc contains one pound of the chloride to five gallons of water. Another simple process for preserving wood and other substances appears to be that of Mr. John Bethell. This consists in the application of creosote, along with coal-tar, or other bituminous matter. The wood is thoroughly saturated to the centre of the log with great rapidity. A load of Fir timber will absorb as much as forty gallons, the close-grained woods less. A cubic foot of Beech usually weighs 8lbs. heavier after it has been prepared by this plan than before. The price of the creosote is 3*d.* per gallon. In some places—Liverpool, for instance—it may be had for 2½*d.* Preserved timber, by Bethell's process, is supplied to the railways at 15*s.* a load beyond the price of common timber. The use of creosote is strongly recommended by Sir John Barrow, in his "Life of Lord Anson." He states that Kyan's Patent (corrosive sublimate) does not prevent decay, neither does it prevent the Teredo navalis from penetrating the timber, as has been proved at the Dock Yards. Wood treated with creosote becomes nearly waterproof, and is not touched by the T. navalis; it requires no painting, but after exposure of some days it loses every unpleasant smell.—*J.*

Transportation of Bees.—In answer to "C. W.'s" inquiry, I beg to inform him that I secured my Bees in their boxes, by screwing each floor board firmly to its box—covering the entrances with fly-proof wire. The boxes were then laid upon the bottom of a large deal case, at such a distance from each other and from the sides of the case, as to allow straw mats to be pushed in tightly between and around them, leaving the entrances free. The case was then laid on the floor of one of those fly-vans which are constructed with double springs, for the conveyance of musical instruments. Thus accommodated, I accompanied the Bees on their journey, travelling with them about 90 miles, and occupying nearly three days in the transit. On examining them at the end of their journey not a Bee nor a comb appeared to have sustained the slightest injury. After placing them in their new locality I gave them their liberty, when they issued forth most vigorously and joyously, and soon felt themselves at home.—*Edw. Bevan, Esgair Evan, Montgomeryshire.*

The Polyanthus.—I have been much pleased with "W.'s" remarks upon the Polyanthus, and agree with what is advanced regarding the necessity of paying more attention to the raising of new varieties; but this is not so easy a matter as may be imagined. There is so great a similarity in all the seedlings that are yearly raised, it rarely happens that a distinct variety can be obtained. It is said that attention has not been paid to collect seed from first-rate varieties; but I can assert that seedlings have been raised from one which is considered a leading one; viz., Hufton's Earl Grey, *alias* Clegg's Lord John Russell, that cannot be distinguished from the original; although only Pearson's Alexander, Buck's George IV., Nicholson's Bang Europe, Collier's Princess Royal, as well as some others equally select, were grown in the garden. Pearson's Alexander generally produces seedlings so much similar to the parent, that many now sold as Pearson's Alexander are nothing but seedlings from it. The great difficulty in seedlings is getting them distinct with respect to marking and character; and the question is, how is this to be remedied? for seed sown from first-rate sorts only has been unsuccessful, and some of the more recent new varieties have been accidentally raised by persons who grow only a few plants, and those not leading ones. Cheshire Favourite was raised by an individual who professes only to be a Gooseberry grower, and has only a straggling plant or two. There is ample room for improvement, and the only way of attaining that object is perseverance, and, occasionally, something may turn out different, which will amply repay the florist for his trouble and exertions. The cultivation of seedlings, if not attended with success, will be a source of enjoyment to the fancier, as seedlings generally are more vigorous, and bloom more freely than such as have been a long time in cultivation; and although they may not be quite equal to the parent, yet they may be planted in the borders, as they are not so tender as those that have been nursed long. With respect to the management of Polyanthuses, I do not think they are so difficult to manage as is represented. I am afraid the reason why they do not succeed in the south is, that proper care is not taken of them. Loudon, in his "Encyclopædia of Gardening," says, "they are very hardy, and will stand the wettest and most severe weather;" but the only varieties that will stand all weathers, are Buck's George IV., Faulkner's Black Prince, and Boardman's Victoria; the two last are not considered stage varieties at the present time. Probably, in mild winters, a collection may be wintered on a warm border; but in the north they are not risked; all are framed. I am not an advocate for their being grown in pots, although when they are raised in that way for exhibition, they can be placed in any situation, and either hastened or retarded, as required; and when the bloom is over, it is easy to have a border prepared twelve inches deep, of the following compost:—

1 barrowful of rotted cow-dung.
1 ,, horse-dung (droppings are generally used.)
1 ,, maiden soil.
1 ,, peat earth;

all which should be mixed up and worked for twelve months previous to using, so that it may be rendered perfectly sweet and pure. Put the plants in this, not plunging the pots, without displacing much soil. I have witnessed the superiority of the mode of growing plants in a border, and shall, until I find occasion to alter, continue that system, although the potting system is principally adopted here. The border in which I grow my plants, is bounded by a double hedge—the outer one is of Thorns, and the inner one of Beech-trees; it is again subdivided by Beech-trees every five yards, which prevents the sun's rays from acting too powerfully upon the plants, and causing them to flag; it also keeps them cool. The border has only the sun shining upon it until eleven o'clock in the morning, and the fence screens them from the mid-day heat. I put down a frame of wood eighteen inches high at the back, and nine inches at the front, and fill in the compost, which is deep enough to bloom the plants in. Glass-lights four feet by three feet are kept over them from October to the end of April, in order to protect them from all severe weather, taking especial care to take off the lights every mild day, and to give them as much air as possible during that time; but, above all things, I take care to protect them from receiving much rain from October until February, as they do not like much moisture; besides, when they are too moist, severe frosts have much greater effect upon them. Emerson says they require the same treatment as Auriculas, which coincides with my practice. In order to give them air during wet days, I have a curved flat iron, about 18 inches long, 1 inch broad, and about ⅜ of an inch thick, with 4 holes like a keyhole placed at equal distances, and fastened by a staple to the frame, being furnished with a pin having a square shank and head sufficient to go through the wide part at the top, which falls down and keeps the light perfectly fast in windy weather, and it can be elevated or lowered according to circumstances. By this mode mildew is prevented. I have taken up plants with roots from 12 to 18 inches long, and

they look much healthier than when they are grown in pots. I have lost during the present winter six plants in pots for one growing in the border, although the number of plants in the latter is about six times that of the former. There is another advantage also gained, viz., the plants being more vigorous, and also much more moist, they are not so liable to be attacked in a dry summer by red spider. I have no doubt that if the above plan is followed out, the difficulty of growing Polyanthuses near London will be obviated, and this favourite flower will once more adorn the gardens of the metropolis.—*John Slater, Cheetham Hill, Manchester.*

Vineyards.—When we consider the trifling expense of cultivation, and the valueless soil in which the Vine will succeed—(it will ripen much better, and be finer flavoured, on a hot, dry, poor soil than on one rich and moist)—it is certainly very strange that this branch of our domestic and rural economy should have been neglected this last 150 years. About this time back immense quantities of wine used to be made for home consumption, and by private families; for instance, at Hatfield, Painshill, Arundle Castle, Hammersmith, and many other places. On the warm gravels of Hertfordshire, the sands of beds and the chalky hills around Brighton, Dover, Deal, &c., which are exactly the localities and soils chosen in Normandy where the Vineyards are situated, it may be safely asserted that no other crop is so profitable on this description of soils. The Fruit in this country, in the worst of seasons, when not sufficiently ripe to be eaten, will make wine fit for pies, tarts, &c. The following sorts are well adapted for this country—White Muscadine, Burgundy, July, Verdelho, Turner's Hardy, Esperione, and Black Cluster, and never fail of a crop. A plantation may be made with cuttings about 18 inches in length, of well-ripened wood; layers the second year, and cuttings the third year, come into bearing, and continue prolific for ages. Herewith I send you directions for making a plantation, which is the result of experience. Plant your Vines 4 feet apart every way; dig holes, and in each put a very little rotten manure; place your plant in the centre, and firmly press the soil round the plant; cut layers down the first year, cuttings the third year, leaving about six eyes only to break from; this to be performed in February; select three of the strongest shoots to remain to each plant; always retain last year's wood for bearing; the summer pruning consists in stopping each shoot when 4 feet high; at which height they must remain, and cutting away all laterals; the three shoots to be tied loosely, as Raspberry canes, to admit the light, &c.; the ground to be kept clean by HOEING only. Each plant will produce, on an average, a dozen bunches; the lowest produce from one acre of poor ground, worth 10*s.*, as follows:—3500 plants, 42,000 bunches of Grapes at one farthing per bunch, 43*l.* odd.—*Vitis.* [*Good* wine cannot be made in England; and *bad* wine may be bought cheaper than it can be made.]

Pruning Forest-trees.—In the *Chronicle* for Jan. 13, Dr. Thackeray describes his practice on this subject. That gentleman is right in "planting those trees the soil most loves;" but the subject that I wish to advance a few remarks upon is, whether curtailing, mutilating, or lessening the head of a tree has a tendency to increase the bulk of its stem—that is, facilitate its growth into timber, which is what is required? Dr. T. says, speaking of plantations made in 1814, "They have been pruned and thinned annually since that period, by taking off from 3 to 5 branches, as before described; and the result has been, that the sap which the cut branches would have exhausted has given vigour and increased strength to the trunk, as is evident from the healthy appearance of the trees, as well as their augmented size." This is founded on the supposition which I have endeavoured to expose from the first starting of the subject in your columns, viz., that what is taken from the head must necessarily be laid on the stem, forgetting the true principle of increase—namely, reciprocal action between roots and branches. The fallacy lies in supposing that the action of the roots will continue the same, whether the head is curtailed or left entire. I by no means disapprove of a little knife-work on young plantations, and highly approve of Dr. T.'s attention to his. Will Dr. T. allow me to ask, how long does he propose his system should be continued—or at what size or age of the trees would he alter or discontinue his practice? I live among many magnificent trees, and see, in abundance of instances around me, the evils resulting from bad management, or no management at all; but I never yet saw a magnificent stem that had not a proportionably large head. "Cut wood and have wood," which Dr. T. has adopted as a motto, has also been assented to by Mr. Hammerton; but its application as a maxim requires some degree of discretion; and Mr. Hammerton's mode of carrying out the maxim is what I should be disposed to approve of. I trust, before another pruning season arrives, those who now so strongly advocate pruning may be induced to consider the true principle of increase, viz., reciprocity between roots and branches; they will then be cautious of interrupting that principle by any system of pruning whatever, and will perceive the fallacy of indulging the idea, that what is taken from the head must necessarily be added to the stem.—*Quercus.*

The Mistletoe.—In reference to the article on the subject of this parasite, at p. 85, I observe that your correspondent quotes the opinion of Sir John Colbatch. I presume this must be the same John Colbatch who wrote a treatise on "the Mistletoe of the Oak," London, 1719. He was a Member of the College of Physicians, and found the Mistletoe efficacious against the epilepsy, chorea Sancti Viti, and other diseases of the nervous system, giving half a drachm of the powder every three or four hours. The book contains full directions for collecting and preparing the plant, which is equally efficacious, the author says, gathered from any other tree, as from the Oak. Does not this tend to prove that the Oak 120 years ago was the principal support of the plant? An example on a large scale of the Mistletoe's affection for the Lime (Tilia), is to be found in Kent, at Penshurst Park, the seat of Lord De Lisle, where in the winter season the very lofty avenue of that tree has, at a little distance, the appearance of a rookery, from the undisturbed and luxuriant growth of the parasite—attributable, no doubt, to its being beyond the reach of Christmas depredators. I have some recollection of seeing it on the Elm close to the same locality, but for this I cannot at the present moment vouch.—*Anonymous.*

Mixture to Heal Wounds on Trees.—I have not found any mixture so good for this purpose as bird-lime; of course the wound of a tree must be dry when it is applied, and therefore it is requisite that a bough or limb should be cut off, one, two, or three days previous to its application, and that the wound should be pared and in readiness. I have in June cut off a limb of an Oak, four or five inches in diameter. I first saw half through the limb at about six inches from the trunk, with the saw teeth upwards. I then saw an inch or two higher up the limb downwards, until the limb drops. The stump is then cut off close to the trunk, taking care not to tear the bark, and the wound is pared clean with a draw-knife, or paring-chisel. If the weather is fine and dry the bird-lime will adhere on the second day. The bird-lime is in a gallipot, and this is placed in water at the heat of 140°; the lime is spread thinly all over the wound, and just a little beyond its edge. This material dries of not a bad colour; but if desired to be very nice indeed, it may be powdered over with a mixture of powdered sumac, indigo, ivory-black, flour dried, old tanners' bark, of which or of some of them a mixture may be made to imitate the colour of the bark of any tree. I imagine pitch mixtures could not be applied unless the wound was in a dry state.—*J. C. X., Bermondsey.*

Winter-felled Oak.—Mr. Billington, in his article on this subject, in a late *Chronicle*, says that "The numerals are thus: 1035, old-fashioned figures," &c. If the figures are Roman numerals, the date may be correct; but if Arabic there must be some mistake, for the Arabic numerals were not used in this country till the fourteenth century. Of the superiority of winter-cut Oak, all carpenters are pretty well agreed; it seems to be an inveterate opinion, as far, at least, as the "sap Oak" timber is concerned. "Heart Oak" is so durable, cut when it may be, that the eight centuries, supposed by Mr. B. for the duration of his Oak beam, are very likely. Two summers ago I met in Normandy with a well-carved inscription, in old French, thus [MCCC&hout] on an Oak beam that had been a chimney lintel. There can be little doubt that, if preserved from wet, it would last five centuries more. The soft or sap part of Oak timber is soon eaten up by the worms, unless winter-cut. I have seen timber taken out of old buildings with the bark still on it with some worm-holes in it; but I believe the prejudice in favour of such timber is founded in fact and experience. I have lost an authority, which some of your readers will probably help me to again, in regard to the fact, that the gates of Constantinople, which were put up by Constantine, were still hanging when it was captured by the Turks. I thought it was in a foot-note of "Gibbon," but I do not find it there. But these, like the gates of Somnauth, I believe were of Cedar, or some such Oriental timber.—*P. P.*

New Heating Apparatus.—The invention described under this title at page 806 of the *Gardeners' Chronicle* for 1843, and said to be constructed on an entirely new principle, will be found to be the same as the hot-air stove known as Boyce's patent. Their mode of action is precisely similar—a current of air being admitted into a kind of chamber surrounding the furnace—which after being heated by the thick iron plate of which the furnace is composed, passes off in pipes communicating with the chamber and opening into the apartments intended to be warmed. In Boyce's patent the furnace is fixed in such a manner as to preclude the possibility of any danger arising from the fire, or from the pipes becoming overheated. The latter in fact never can be the case, as the pipes are merely conductors of the heated air, and have no connection with the open fireplace. They are generally made of thin copper, and are about four or five inches diameter. The circulation is regulated by ventilator, which admit of its being increased or diminished at pleasure. For warming large buildings, I have reason to know that this kind of stove answers the purpose most completely; but I very much question whether it will be found so well adapted for Horticultural purposes, as the heat obtained from it is always dry compared with that derived from the circulation of hot water on the tank or open-gutter system.—*W. B. Booth.*

Budding and Inarching.—In your Paper of the 27th ult., there is an article on this subject, signed "W. G." If I understand the writer correctly, he cuts off a growing bud or shoot, when the leaves do not exceed two inches in diameter, and inserts it in the usual method of budding. Will "W. G." state how much of the bark he cuts with the young shoot?—*A Subscriber, Maidstone.*

Bees.—Mr. Pettigrew has now presented you with his animadversions on the "Honey Bee," and his lucubrations on Bee culture in general, and brought both to a conclusion. But I feel by no means disposed to enter at any length upon a reply to him. It would be almost tantamount to undertaking the task of publishing a third edition of the "Honey Bee," which I must be impelled to by some stronger inducement than Mr. Pettigrew has held out to me. To my readers and the followers of the system of management, recommended in that work, I ought perhaps to say, that the opinions and the statements it contains remain unshaken by anything advanced by Mr. Pettigrew. Any inquiries, however, from whatever quarter, as to the *rationale* of that system, shall at all times be fully replied to, as they always have been. This Mr. Pettigrew, as a constant reader of the *Gardeners' Chronicle*, must be aware of.—*Edward Bevan, Esgair Evan, Montgomeryshire.*

Societies.

HORTICULTURAL SOCIETY.

March 5.—R. W. Barchard, Esq., in the chair. Col. W. Mason, J. Dixon, G. H. Hooper, J. Dearden, and A. G. Fullerton, Esqrs., were elected Fellows. From S. Rucker, Esq., were two exceedingly handsome large-flowered varieties of the Lycaste Skinneri, differing in colour, the one being paler, with a more distinctly marked lip than the other, which was of a deeper purple. Along with these was Phalænopsis amabilis, a plant of great beauty, having a fine bending raceme of large showy white blossoms; also a specimen of Cyrtochilum maculatum, having two pretty spikes of brown and white blossoms; and a plant of Cypripedium barbatum, which considerably resembles venustum. From the same collection was likewise the scarce Galeandra Devoniana, and a cut spike of Coryanthes maculata, curious on account of having its lip gathered up into a kind of bucket, which serves in the economy of the plant to hold a sweet fluid, which slowly drops into it from two processes or secreting glands that are situated immediately above it—a large silver medal was awarded to Mr. Rucker for this collection.—Mr. Robertson, gr. to Mrs. Lawrence, sent a well-grown plant of Æschynanthus maculatus with dark fleshy leaves, among which its numerous clusters of gorgeous scarlet blossoms produced a pretty effect. Also plants of the pretty Schomburgkia undulata and S. crispa, having tall flower stems bearing rich heads of showy blossoms. From the same collection was likewise a pretty plant of Camarotis purpurea, growing in a basket, and a well-grown specimen of Styphelia tubiflora, a greenhouse plant of a gay graceful appearance—a Knightian medal was awarded for the Schomburgkias, Camarotis, and Styphelia.—From Messrs. Rollisson, of Tooting, were beautiful plants of Dendrobium densiflorum and D. Cambridgeanum, the latter with handsome racemes of bright orange blossoms, having a pretty dark velvety spot on the labellum. In the same collection was likewise Phalænopsis amabilis in good condition; also Cœlogyne cristata, a scarce plant, having pretty fragrant blossoms of pure white, except the lip which, in the centre, is covered with bright yellow fringes; also a beautiful large-flowered variety of Oncidium papilio, much superior to the old one, both in point of size and colour. Messrs. Rollisson likewise sent a variety of Cattleya Mossiæ, a Maxillaria from Guatemala, and a new species of Miltonia from Brazil, having handsome brown and white blossoms; a Knightian medal was awarded for these.—Mr. Kennington, gr. to F. Cox, Esq., of Stockwell, exhibited Stanhopea quadricornis, having a fine spike of flowers; Zygopetalum rostratum, Oncidium papilio, and Dendrobium Pierardi, on a block, in good condition.—From Messrs. Veitch and Son, of Exeter, was Lycaste Skinneri, and Barbacenia squamata, with red star-like flowers, and a small hard dry foliage, that was lately introduced by Mr. Veitch's collector; a certificate was awarded for it.—From Mr. Jackson, of Kingston, was a cut specimen of Inga pulcherrima, a pretty stove plant, having charming tassels of bloom, which are formed by the long crimson filaments. C. B. Warner, Esq., sent a collection of cut flowers, among which were Dendrobium densiflorum, Camarotis purpurea, a Bletia, &c.—Mrs. Marryatt sent a cut flower of Schomburgkia marginata which, although not so showy as others of this genus, is nevertheless pretty.—Mr. Glendinning, of Chiswick Nursery, sent a beautiful plant of Eriostemon buxifolius, of which he writes as follows:—"It is one of the prettiest plants we have, and may be forced into flower at any period during the winter months. Its fine dark green foliage, and neat habit, combined with its abundant snow-white, sweet-scented blossoms, render it an object of much interest. It will stand a good deal of forcing without the least injury, and remain in blossom for a considerable period. It is, therefore, a plant not only desirable for summer exhibition; but more espet cially for decorating the conservatory or drawing-room in winter. Cut sprigs of it are very useful in making bouquets." Mr. Glendinning states that this plant, which is now in good health and covered with bloom, was of small size, growing in a small pot about six months ago, and in bad health; but that one large shift and a higher temperature had brought it to its present healthy and luxuriant state; a Banksian medal was awarded for this.—From Mr. Hamp, gr. to J. Thorne, Esq., was a bushy plant of Epacris nivalis, a large specimen of Phaius Tankervillæ, and a small plant of Franciscea Hopeana, along with Erica transparens, which was in good condition.—Sir C. Monck, Bart., sent specimens of Forbidden Fruit for exhibition. From the same gentleman was also the following communication respecting the destruction of brown scale on Orange-trees:—"I ascertained by experiment that an infusion of Camomile would serve to clear Orange-trees of their most baneful pest, the brown scale. I am confirmed in the opinion; my trees are cleared, and have proportionably recovered their health." The fruit exhibited were in good condition, and were stated to have been gathered from a small tree which had had no more accommodation than was afforded by a shady Vinery in summer, and the same sunny Vinery in winter.—From Mr. Dunsford, gr. to W. Everett, Esq., was a brace of

Cucumbers, each 13½ inches long, that had been cut from a dung-pit six weeks after putting out.—Mr. Ayres, gr. to C. L. Stephens, Esq., sent two brace of Cucumbers, the longest measuring 19 inches in length: they were grown in a pit that is heated by Penn's system. For these a certificate was awarded.—Mr. Doran, gr. to T. Hawes, Esq., sent three specimens of Cucumbers.—From J. Biddulph, Esq., were six specimens of Apples, in good condition.—From the garden of the Society were Chysis bractescens, Epidendrum Stamfordianum, a charming fragrant species, sent to the Society from Guatemala, by Mr. Hartweg; also E. aurantiacum, Phycella ignea, Acacia verniciflua, and another species, along with Arctostaphylos pungens, which is a neat little half-hardy evergreen shrub, that was introduced from Mexico, by Mr. Hartweg.—Cuttings were distributed of Knight's Monarch Pear, stated to be hardy and a good bearer, succeeding best as a standard, and bearing rich and melting fruit which keep well until January: the Dunmore Pear, also raised by Mr. Knight; it is perfectly hardy, and the fruit attains a large size, on a standard partaking of the flavour of the Brown Beurré, when the latter is perfectly ripened. There were also cuttings of the Blue Perdrigon Plum, sometimes known by the name of Brignole Violet; it is one of the varieties which furnish the Brignole Prunes; the fruit is of a purple colour, very rich, and comes into use soon after the Green Gage. Likewise the Perdrigon Violet Hâtif, which, in some respects, resembles the former, but is quite distinct, ripening much earlier; the flesh is so very rich, that, instead of decaying rapidly when ripe, the fruit will hang and become shrivelled on the tree.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

GENISTA VIRGATA. Twiggy Broom. (*Hardy Shrub.*) Leguminosæ. Monadelphia Decandria.—Mr. Young, Nurseryman, Milford, states that with him this is a very handsome compact shrub, which resisted the hard winter of 1836-7. It was raised from the seeds sent by Mr. Webb from Madeira in 1825, was turned out in 1833 into the open border, and is now a very woody shrub. It is deserving a place in all shrubberies. In the garden of the Horticultural Society it grows about four feet high, and is capable of enduring the ordinary winters round London, if placed in a dry situation, and planted in a loamy soil. It is increased by seeds, or by cuttings of the young wood after midsummer. The cuttings should be placed in a shady situation, in light sandy soil, and covered with a hand-glass. It flowers freely in May and June, and forms a loose rather spreading bush, rather thin of foliage. In the nurseries it is generally known by the name of Spartium virgatum. In such wild and cultivated specimens as we have had the opportunity of examining, the leaves were uniformly simple; in Mr. Young's specimen, however, the lowest on each twig, those, in fact, from whose axil the twigs proceeded, were trifoliolate. This is interesting, as showing an occasional passage to the 3-leaved species, even among those whose foliage is most decidedly simple.—*Botanical Register.*

LUXEMBURGIA CILIOSA. Fringe-leaved Luxemburgia. (*Stove Shrub.*) Violaceæ. Monadelphia Polyandria.—This fine plant forms a very elegant shrub, from two to four feet high; but it is said to attain a height of eight to twelve feet in Brazil, where it also bears branches. "It was first detected," says Sir W. J. Hooker, "by Martius, in the Diamond district, province of Minas Geraes; and subsequently in the year 1841, by Mr. Gardner, in moist, peaty soil, in open places, growing with species of Andromeda, on the Organ Mountains, at an elevation of 5000 feet above the level of the sea. It has been in British collections about eighteen months or two years, and flowered in several places during the season of 1843. We saw beautiful specimens from the Royal Botanic Gardens of Kew; from Messrs. Lucombe, Pince, and Co., of Exeter; at the nursery of Mr. Knight, King's-road, Chelsea; and in other large nurseries. It is through Mr. Gardner that the stock now in England appears to have been obtained. No plant can be more regular, neat, and pleasing in its mode of growth. There is a very peculiar symmetry, cleanness, and healthiness about it, which seem to attend it in all conditions, and give it a most ornamental appearance. It grows perfectly erect, with a clear stem, and, as we have seen it, to about a foot or eighteen inches in height, without at present having borne any branches. It is well clothed with leaves, from about four or six inches above the soil, and these leaves are long, narrow, very elegant, of the purest green, and delicately cut along the edges into hair-like teeth, which are remarkable for their extreme uniformity. From the top of the stem an upright spike of flowers issues, forming a sort of cone. The flowers are numerous, well-disposed, large, and of a clear lively yellow. They last a considerable time, and are produced abundantly on plants not more than a foot high. The species requires a stove temperature, and a moist atmosphere, with a rather enriched loamy soil. It would most probably be benefited by a gentle bottom-heat. Were it once to branch in this country, as it may possibly be induced to do by cutting off its summit, its spikes of flowers, proceeding from the extremity of every shoot, will render it one of the very best of our stove plants.—*Paxton's Magazine of Botany.*

Miscellaneous.

A Textile Plant from China.—M. Stanislas Julien has given to the Museum of Natural History (at Paris), the seeds of a Textile plant, which M. l'Abbé Voisin, one of the directors of foreign missions, obtained from China. This plant, which they call Ko-hoang-kin, Louho, and Khi-thsi, is met with everywhere, but particularly in the provinces of Tche Kiang and Tiang-Nan. M. Julien has taken its description, the details connected with its cultivation, and the preparation of the clothing that is made from it, from the "Encyclopædia of Chinese Agriculture." The seeds germinated in the Garden of Plants, and its botanical characters, will soon be ascertained. In the meantime, M. de Jussieu thinks that the plant is a Kidney-Bean, near Dolichos, and particularly D. bulbosus.—*Rev. Hort., Nov.* 1843.—*T.*

Pelargonium Leaves a Cure for Wounds.—The leaves of the Pelargonium are, as everybody knows, strongly scented; some smell of Rose, others of Lemons, Apples, &c.; there are also other sorts, which, when bruised, have a nauseous and rather disagreeable odour. All the species and varieties of this genus contain a large quantity of essential oil, which is usually fatty; there are several sorts which are cultivated in the open air in the south of France, and particularly at Nice, for the purpose of extracting the oil, which is sold to the perfumers. The leaves of all Pelargoniums have also the property of quickly healing cuts, places where the skin has been rubbed off, and other sores of that kind. You take one leaf or more of the Pelargonium, which you bruise upon a piece of linen; you then apply it to the sore place, and it often happens that one leaf is sufficient to heal the wound. It sticks closely to the surrounding skin, and helps to close the flesh, and heals the wound in a short time. I have often tried this method, and found it succeed well with myself, and also with others to whom I have mentioned it. The Pelargonium zonale, one of the oldest and most common in gardens, is much more efficacious than others of the same kind; its shining and fleshy leaves render it far preferable to those which are dry, ribbed, and downy. —*Rev. Hort.*, 1843, p. 464.

Plants producing Wax.—There is in Brazil, besides the well-known Corypha cerifera, two other plants remarkable for the secretion of wax in their fruit. The one is called in Brazil, Hycuiba, and grows about San Paulo; the other is called Ocuuba, and abounds in Para.—*Bot. Zeit.*

Cultivation of Onions by the Tartars.—The Tartars, who bring all sorts of vegetables to Wilna, the capital of the grand duchy of Lithuania, have a particular method of cultivating Onions. Instead of raising them from seeds, in which they do not succeed, or which appears to them too long a process, they dry and smoke in a chimney those which they wish to propagate, and in spring, when the time to plant them is arrived, they cut them diagonally into quarters, but so as not to separate the pieces entirely one from the other. They set these Onions in rows, when thus prepared, in good soil, well dug, but not freshly manured, at about 10 inches from each other, and two inches deep. These Onions increase extraordinarily, and grow large and strong.—*Rev. Hort.*, 1843, p. 449.

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSES, CONSERVATORIES, &c.

WHEN a considerable portion of plants is potted, the stove ought to be kept pretty close for a week or two, to encourage the plants to form new roots and strike freely into the fresh soil. Many of the more robust kinds must be pruned at the roots, the old soil being first shaken from them, when they may be got into smaller pots; the larger roots will do to graft some of the same family on, or will form young plants if put in as cuttings; this is an easy way of getting a large stock of some plants, and almost any sort will grow from root-cuttings, in the spring. Plants may now be more freely watered, and the houses kept moderately moist.

Conservatory.—As a great number of spring-flowering plants are now coming into bloom, more air must be admitted; but those recently removed from the forcing-pits, and all stove-plants brought in to bloom, must be arranged in the warmest parts of the house. Fresh beds of soil should now be made for all climbers that are to be planted this season, and a portion of the old soil removed, from such established ones as are known to quickly exhaust the soil, to be replaced by a fresh supply: this will be a good opportunity to cut or root-prune such climbers as have rambled over the house without flowering much for the last year or two, and where duplicates exist, this is a suitable time to cut down some of them to the surface of the ground, in order to prolong their flowering season; this is also the best way to get rid of plants infested with scales, or other troublesome insects, if care is taken to clean the remaining portion of the plants and the pillars or trellis, &c., to which they have been trained.

Greenhouse.—This is a good time to propagate greenhouse-plants by cuttings, &c., where a gentle bottom-heat can be maintained; great attention is required to keep these plants from growing too fast at this season; the least confinement is injurious to many tribes of woody plants of this department. The tops of young plants in free growth, ought occasionally to be cut off, in order to get good bushy specimens, even if their bloom is sacrificed at this stage.

Forcing-Pits.—These must now be kept more moist as the season advances. Cuttings reared in these pits ought to be potted off as soon as they are rooted. Thumb-pots are convenient for striking cuttings of favourite plants, in putting only one in each, and when they are rooted they are easily removed into larger pots with little check to the young plant. Seedlings demand all the attention you can give them now. When the least appearance of mouldiness is seen on the seed-pots, rub it off and sprinkle some dry peat or sand over the surface, and keep the pot rather dry for a day or two, when this additional covering may be shaken or blown off the pot.—*D. B.*

II.—FLOWER-GARDEN AND SHRUBBERIES.

Out-door Department.

Need I ask if you have decided upon what plants the beds in the Flower-garden are to be planted with this season? If not, the sooner the decision is made the better, or you will be too late. Autumn-sown annuals may now be removed to their blooming-places, planting three or five in a patch according to the kind and size. For beds intended to be planted with half-hardy things, I plant the annuals in a line round the outside, and being pegged or clipped into shape, they form a neat and gay edging in the early part of the season, and leave the centre of the beds to be thickly planted with such plants as are intended for summer and autumn decoration. Californian annuals, such as Clarkias, Collinsias, Leptosiphons, Nemophilas, &c., sown now, will bloom almost as soon as those sown in the autumn; indeed, it is a good plan to sow a few seeds at the time of planting, as they fill up all vacancies, and prolong the season of bloom. Herbaceous borders, if not dressed over in the autumn, must be attended to immediately, and either fresh compost or manure must be added to all plants that are weakly.

Reserve Garden.—Proceed with the planting out of biennials of all kinds, and prepare a good-sized piece of ground for a sowing of Anemone coronaria, hortensis, and vitifolia. Anemones delight in a strong rich soil, and a rather shady situation in the summer season. Sow the seed, after being well rubbed in sand, in shallow drills, nine inches apart, and cover with rich soil from the compost-yard. A sowing of Ten-week Stocks must also be made on a warm sunny border; cover with litter or mats at night, until the seeds begin to vegetate. Sow likewise a general assortment of annuals for transplanting, to fill up vacancies.

Pits and Frames.—Here the work needs no pointing out; the means of providing room after the plants are potted is the greatest difficulty in most gardens. Calico dressed with Whitney's composition, at a cost of 5*d.* per yard, answers admirably in the gardens of Mr. Beck, of Isleworth. This is, I imagine, likely to become an exceedingly useful article, and is just the sort of material that is required after plants are first potted off. Choice annuals—such as Brachycome iberidifolia, Viscaria oculata, Mesembryanthemum tricolor, Portulacas, Clintonias, and the like—should always be potted off as soon as they are sufficiently large to handle, and afterwards be placed in a warm moist atmosphere, with plenty of air in mild weather, until they are properly established. Sow in a brisk heat Martynia fragrans and diandra, the different varieties of Thunbergia and Ipomœa, Convolvulus minor and major, and, where they are admired, the common yellow and other Lupines.—*W. P. A.*

III.—FLORISTS' FLOWERS.

Auriculas.—Attend to directions previously given. Seed may now be sown. The best compost is sandy peat and leaf-soil. Shallow boxes or pans should be filled nearly full, and watered well to make it settle, when the seed may be thinly strewn on the surface, covering very slightly. The blooms are now rising; mind that the trusses are not drawn by keeping the lights on too much.

Polyanthuses.—Still have a sharp look out for snails. With a very small hand-fork keep the surface of the bed loose, taking care not to disturb the fibres. If grown in pots, the soil must be occasionally stirred, keeping them moderately moist. In purchasing Polyanthuses it must be borne in mind, that Hufton's Earl Grey and Clegg's Lord John Russell are one and the same flower, the former being the proper name.

Ranunculuses.—If the fine day or two last week were taken advantage of, many Ranunculus beds will have been planted; if not, the sooner the better.

Tulips.—The beds must be carefully gone over and the cracks in the soil filled up, putting it firmly round the neck or rising leaves of the flower. A blunt stick is a simple though effectual instrument to loosen the soil between the rows. Should the leaves appear cankered the soil must be displaced and the diseased part cut away with a sharp penknife: after which operation it is necessary to keep the wound dry, which may be accomplished by placing a hand-glass over it, supported by three small forked pegs; thus ensuring a free circulation of air, and at the same time defending it from the rain. Cover the beds well on frosty nights.

Carnations.—Are now beginning to move, and diseased plants which have struggled through the winter thus far, are dying off. Double diligence must be directed towards the compost. The careful florist who does not mean to give a chance away, will make it all pass through his hands, so that it is almost impossible a wire-worm should escape him.

Pinks.—A few sorts worth growing are Norman's Splendid, Beauty of Weston, very fine, Creed's President, Headley's Duke of Northumberland, Kirtland's Dr. Daubeny, Pearson's Professor, Cowdrey's Lord Calthorpe, Kirtland's Gay Lad, Church's Navigator, and Bunkell's Prince Albert. All vacancies in the beds must now be made up, and the soil kept in a loose friable state on the surface. Look well to the trap for wire-worms, &c. —*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pinery.—It is now quite time that the spring shifting and regulating of Pines were finished. Where this is not the case, the plants will receive the greater check, as the roots are now active from the influence of the returning spring. The fruiting Pines should be kept at 65° or 70° by night. The whole of the Pines will now require a more moist atmosphere during the day, particularly in clear weather. It sometimes occurs that an excess of moisture in the pits causes the soil round the collar of the plants to become quite wet, and as this proves very injurious to the young roots that will be now forming at that particular point, it will be well to guard against it. Much syringing and sprinkling with the watering-pot at this time has the same injurious effect. When the sun has more power, and air is more freely admitted, this otherwise useful practice may be indulged in.

Vinery.—In the early house, the leading shoots being stopped at the required length, and the laterals regularly pinched in, the fruit will be advancing fast. Keep a moist atmosphere during the day, and particularly when air is admitted. The rootlets at the joints of the Vines are of use in extracting nourishment from the atmosphere, and when that is kept moist during sunshine, they are longer kept in a condition to perform those functions designed them by nature. Rub off all useless shoots from the Vines now breaking, and thin the fruitful ones, leaving the strongest and best placed; and when it can be seen which are the most promising "shows," thin them also, leaving one on each spur or side shoot. It is better to have several bunches less than the Vine could bring to perfection without injury, than one too many. Examine again the state of the heat in the outside borders, as the rains and cold weather soon chill the heating material.

Peach house.—The roots of the Peach being numerous, and generally running near the surface, it can scarcely be too often repeated, that it is necessary to pay strict attention to the state of the border as regards moisture during the swelling of the fruit. If the border was not top-dressed during the winter, it may be done now with decayed turf and soot, or the dust from charcoal. It is quite astonishing to see how soon the roots attach themselves to the turf, if applied when the plant is growing; and perhaps this is the best time to apply it, as less of the fertilising matter is lost.

Fig house.—Those plants in pots, started in November, will be approaching maturity, and must have air on all favourable occasions. Stop the side shoots on all the plants that have attained the desired size, above the second leaf. Keep down insects, by a free use of the syringe, till the fruit begins to ripen.

Melons.—Plants grown in pits, heated by hot water, are seldom so healthy at this season as those grown on dung beds; but by giving a little air every day—keeping at the same time a moist atmosphere, and a temperature not less than 75°, by fire-heat, on dull days—they soon become strong; and, as the season advances, they surpass in vigour those in frames. Never shade the plants till they appear to be flagging, remove the netting as soon as possible, and endeavour to get your plants to stand the heat of the sun.—*G. F.*

V.—HARDY FRUIT AND KITCHEN GARDEN.

Cutting and Raising Roots of Fruit-Trees.—This may still be performed where there is a tendency to over-luxuriance. Unless in extreme cases, the roots should not be cut nearer the stem than from two to three yards. It is safer to raise the roots nearer the surface. If trees were planted shallow, in poor fresh soil, mulched with dry litter during summer, and the cropping of the borders dispensed with, the operation of cutting the roots would be seldom required.

Potatoes.—Where gardeners grow the general supply for the establishment, it is desirable to change seed with another place where soil and situation are different. A few Ash leaved Kidney may be planted on a warm border.

Protection.—Much trouble will have been requisite lately with Cucumbers, Radishes, Cauliflowers, Potatoes, Salads, &c. The chief thing to be aimed at, is not merely to keep out the frost, but to prevent the plants from being drawn up weak, by keeping them in a higher temperature when covered up, than when they are exposed to the light.

Cabbage.—Take the first opportunity to fill up all vacancies in those planted in autumn, and sow in a warm border for succession. A sort I received last summer, under the name of the "London Market," seems to be very early. For general purposes I have met with none heretofore so profitable as the Vanack. A quarter planted in the autumn of 1842 has produced plentifully to the present time.

Routine.—In favourable circumstances, Horn Carrots, Radishes, Spinach, &c., may be sown; but, in most cases, it will be preferable to get the ground in good order, and defer sowing or planting much out of doors for a week or two to come.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—In the present state of the weather little can be done in this department.

Coppice.—When the weather is favourable, the cutting of corf rods, poles, &c., should be proceeded with; spring is the best season for such operations, as the stools make more vigorous shoots. Birch should be left until the buds and leaves are beginning to expand, on account of its being very liable to bleed.

Young Plantations.—Great injury arises to outside trees, by suffering the hedges to grow up for years before plashing, or cutting them, whereby they become naked at bottom. If hedges were kept low at an early period, the outside trees would become feathered with branches to the bottom, and would form a screen

or the others. By shortening the lower outside branches in time, it would prevent them from extending to destroy the hedges, before the trees are advanced to a sufficient height above them to become ornamental as outside trees, when the lower shortened branches might be taken off if necessary. From 3 to 5 feet high, according to circumstances, is a good height for hedges. Spring is the best time to perform such work, when the weather is suitable.

Hedge-rows.—Proceed with the works pointed out in the two preceding months.

Nursery Work.—Little can be done in this department, except indoor work, or trenching rough ground when the weather will permit.—*W. B.*

State of the Weather at Chiswick during the last 18 years, for the ensuing Week ending March 16, 1844.

Average		29.678	29.557	46.8	.4	38.6		.76

March 1. Cloudy and fine; rain at night.
2. Lightly overcast with whitish hazy clouds; squally, with heavy showers.
3. Cloudy and windy: clear and fine.
4. Constant heavy rain throughout; cloudy and fine at night.
5. Overcast; cold, with heavy clouds; clear, with sharp frost at night.
6. Clear and frosty; lightly overcast; clear; slight frost.
7. Cloudy and cold throughout; very clear, with slight frost at night.

Mean temperature of the week, 3.7 deg. below the average.

Notices to Correspondents.

GARDENERS' CHRONICLE.—The first Number of the present year has been reprinted, and may now be had. The newspaper part has been omitted.

OUR CORRESPONDENTS will oblige us by not mixing together Agricultural and Horticultural questions, and by writing them on one side of the paper only. Such precautions can give them no trouble, and will save us a great deal.

COMMUNICATIONS from the following CORRESPONDENTS are in type, and are only waiting till room can be found for them:—*H. S., A. Pettigrew, E. J., J. Wighton, W. R., W. Billington, M. G., J. B. K. L., A Practical Man, Peter Mackenzie, G. Thompson, Gr., J. Spencer, J. M'I., R. Reid,* and *J. Alexander, J. C. S.*

APPLES.—*A Subscriber.*—Six first-rate desert varieties in succession may be the Golden Reinette, Claygate Pearmain, Ribstone Pippin, Pearson's Plate, Herefordshire Pearmain, and Sturmer Pippin.‡

ATMOSPHERIC MOISTURE.—*H. C.*—The air within your Vine-frame will be found sufficiently moist, if the soil below is kept duly watered, the wall and foliage syringed, and some warm covering drawn over the glass at night. The latter precaution will prove doubly beneficial,—1stly, on account of warmth; and 2dly, as a consequence of the glass being kept warmer, its effect in condensing moisture at the expense of that contained in the air within the frame will be diminished. The space being small, if you do not make sure of giving ventilation soon enough, you will lose your crop. ‖

BEES.—*J. W. K.*—Two of Bagster's hives were stocked with a swarm each in 1835; No. 1 on the 22d May, and No. 2 on the 2d of June. From that time to the present No. 1 has yielded 54 lbs. of honey and one swarm, and is still strong; No. 2 yielded 20 lbs. of honey, and 5 swarms, and died during last winter. When the Bees enter the side apartments, they fasten the tin slides so securely with their propolis, that it is impossible to return them in the way directed by Mr. Bagster, and the taking of honey is effected with much difficulty and danger. The small quantity of honey obtained is not owing to a bad situation, as from a single box hive, with a glass on the top, in the same garden, 40 lbs. of honey were taken, in 1842, leaving the Bees an abundant supply for the winter; nor was this a solitary instance.—*Beta.*

BOOKS.—*A Beginner.*—Mackintosh's Practical Gardener.

BROCCOLI.—*Rus.*—Grange's Early White and Chapple's Early Cream, if sown at three different times between the beginning of May to the end of June, will produce heads in succession from Michaelmas to Christmas. ‡

CEDARS, &c.—*S. M. W.*—There is little hope of recovering an old Cedar when once it is in a bad state of health, but as yours is planted in a soil which is dry and mixed with chalk, it may be improved in the following manner:—Remove the turf round the tree to the distance of about 20 feet in diameter, and then loosen the soil with a fork, so as not to injure the roots; afterwards give the exposed surface a watering with 2 gallons of sulphuric acid diluted with sixty times its quantity of water, using it when the weather is moist. When this is done the turf may be relaid. Nitrate of soda is very injurious to sickly Firs, and particularly in a light dry soil, although very beneficial to healthy young ones in a strong damp soil. A small portion of nitrate of soda may benefit your Araucaria, when it becomes well established in the open ground; but this should certainly not be applied when it is first planted, which should be done about the middle of May.¶

CHIMONANTHUS FRAGRANS.—*B. F.*—There are few plants of more easy cultivation than this. You have only to train it in an open border against a south wall, and it will take care of itself.‡

CLIMBERS.—*A Subscriber.*—The following are suitable for covering the back wall of a greenhouse: Clematis azurea grandiflora, C. Sieboldii, Cobæa scandens, Maurandya Barclayana, and Hardenbergia macrophylla. A mixture of turfy loam, peat, and sand is a suitable compost for them. On iron supports, you may train Kennedia Marryattæ and Hardenbergia monophylla.‡

CREEPERS.—*A Gardener.*—In order to render an old root of a tree an ornament to a flower-garden you may cover it with the following creepers, viz.:—Eccremocarpus scaber, Lophospermum erubescens, L. scandens, and Convolvulus major.‡

CUTTINGS.—*W. F. C.*—Phillyreas and Alaternus may be struck from cuttings, but it is a very uncertain way; they do much better to be layered in pots about Midsummer. In striking them from cuttings select the previous year's young wood, before the shoots begin to grow, after Midsummer, and placing them in a light sandy soil, cover them close with a hand-glass. They should be placed in a north aspect, out of the sun's rays. When the cuttings are first put in, give them a good watering; but afterwards let the glasses remain close until they are struck.¶

DORYANTHES EXCELSA.—*A. B.*—This requires to be planted in a very large tub, or in the open pit of a conservatory. It should be allowed plenty of summer heat and light, but it must have age before it will bloom. The soil you have it growing in is suitable for it. The flower-stem of Oncidium altissimum grows often from 6 to 10 feet before its blossoms expand. Why Stanhopea insignis does not flower we cannot tell without seeing it.‡

FABIANA IMBRICATA.—*Anon.*—This is hardy, and will flower in a north border in the neighbourhood of London. ‡

FELLING.—*J. L.*—Trees which are to preserve their bark should be felled in winter.

FIR-TREES.—*W. F. C.*—The common Spruce and Scotch Fir will bear planting on a cliff near the sea, and may be kept down to 5 or 6 feet high, if the leading shoots are constantly pinched off. The Tartarian and Chinese Arbor Vitæ, or the common kinds of Cypress and Juniper, will also suit that purpose. The common Yew will likewise succeed in such a situation. These kinds will all bear cutting and clipping when young.¶

FRUIT-TREES.—*H. Palmer.*—The Marie-Louise and Hacon's Incomparable will suit you, as regards Pears; the Blue Gage Plum is not worthy of cultivation, but the Purple Gage, or Reine Claude Violette, and Royale Hâtive, are excellent. The nearest respectable nurseryman ought either to be able to supply you with the above, or procure them. ‖——*D.*—On your south aspect you may plant two Glout Morceau, two Winter Nelis, two Beurré Rance, one Passe Colmar, Elton and Knight's Early Black Cherries, and the Purple Gage Plum. On the north aspect, Marie-Louise, Comte de Lamy, two Hacon's Incomparable, the Catillac for stewing, Washington Plum, May Duke and Morello Cherries. For the east and west aspects; Knight's Monarch, Beurré Bosc, Thompson's, Louise-Bonne of Jersey, and Easter Beurré Pears; the Purple Gage, Coe's Golden Drop, and Royale Hâtive Plums; Knight's Early Black and Florence Cherries. Four good Peaches are Royale Charlotte, Barrington, Bellegorde, and Malta. ‖

GOLD FISH.—*A. C.*—Our answer was given upon the *best* authority which can be obtained. You are certainly wrong.

GOOSEBERRIES.—*H. Palmer.*—The Roaring Lion, London, Companion, Wonderful Leader, Thumper, and Eagle, are amongst the largest of prize varieties. ‖

GORSE.—*H. C.*—Your plantation of this that has an unsightly appearance, being naked at bottom, should be cut over to within 4 inches of the ground. The best season for the operation is October; but if the plants are not yet far advanced in flowering, it may be done now.‡

GRAFTING VINES.—*Z.*—The Vine may be successfully grafted either by whip or cleft grafting; but whichever mode is adopted the plant must be in leaf before the operation is performed. ‖

GRASS LAWNS.—*B. D.*—Resinous sawdust is of little value as a manure for grass lawns except it is charred, when it becomes useful. Sawdust from trees that are not resinous does very well as manure when mixed with the dunghill or soaked with urine from the tank. It may also be burned, when its ashes are useful; but charring is best. ‡

HARDY SHRUBS.—*Anon.*—The following dwarf shrubs are suitable for a border:—Berberis aquifolium, Ribes sanguineum, R. aureum, Amygdalus nana, Daphne Cneorum, Calycanthus floridus, Deutzia scabra, Spiræa ariæfolia, S. tomentosa, Syringa Josikæa, Garrya elliptica, and Viburnum Tinus. In front of these the following plants will have a good effect, viz., Delphinium grandiflorum, Coreopsis lanceolata, Lupinus polyphyllus, Pentstemon ovatus, Campanula grandis, Saxifraga crassifolia, Baptisia australis, Trollius Asiaticus, and Aubrietia deltoidea. ‡

HEATING.—*X. Z.*—Use such gutters as are represented at p. 659, 1843. Two, viz., a flow and return, are sufficient for the pit of your hot house; and the same number for your other pit. For so small an amount of duty, a second-sized boiler should be quite enough.——*G. H.*—Your question demands a longer answer than we can give just now; but we will bear it in mind, and answer you soon in some detail.——*T. A. N.*—Sawdust is a bad plunging material, because it is a very bad conductor. Coarsely-sifted cinders are found by experience to be the best we have seen tried.

HYACINTHS.—*Chemical Jack.*—In order to preserve Hyacinths (which have been grown in glasses) for the next year, it is best to transfer them, after flowering, to the open air, where they can be plunged in soil, and guarded from frost, which will be sufficiently effected by mats thrown over them at night.

INSECTS.—If *A Beginner* will favour us with specimens of the Caterpillars which puncture the fruit of his Cherry-trees we shall feel obliged; but to give him any useful information without such materials is not in our power. To get rid of the Black Fly, syringing with tobacco-water is considered the best remedy. To make the wash dissolve ½-lb. of soap in a gallon of soft water, add to it one gallon of tobacco-water, and then dilute it with two gallons more of soft water. *R.*——*W. C.*—Your Pear-tree is hide-bound with the Mussel-scale (Aspidiotus conchiformis), whose history was given in last year's *Chronicle*, p. 735, to which we must refer you for a remedy. *R.*

LIME.—*Rustic Robin.*—Lime is a bad conductor of heat. All earthy substances are so. The conducting power of marble as compared with gold is as 24 to 1000. We do not like your plan. If your dung is sweetened no ill effects will arise from its vapours; but your flues will, we fear, dry it so as to injure the roots of the Cucumbers.

MANURES.—*Inquisitor.*—About 3 cwt. to an acre of Potter's guano is the quantity usually applied for kitchen-garden produce. Of this, about half of a wine-glassful to a 24-sized pot is sufficient for Pelargoniums. It should be spread on the surface of the mould in the pot, covering it slightly with soil, and allowing it to be washed down by degrees.‡——*W. B.*—We have not seen it tried; but there can be no doubt that a good watering with liquid guano would be advantageous to fruit-trees that *require* manure. We should stir a double handful up in a pot of water.——*G. R.*—Give a wine-glassful of superphosphate of lime to each pot in which your Pelargoniums are to flower. Apply it as a top-dressing only allowing it to be washed down by degrees in watering the plants. ‡——*G. I. T.*—Two parts of superphosphate of lime mixed with one of charcoal, may be applied to Onions when they begin to appear above ground, or it may be mixed with a small quantity of fine soil and sown in the drills along with the seeds. It should be applied at the rate of 3 cwt. per acre. ‡——*John.*—We do not know the composition of Potter's guano. It is said to contain the same constituents as Peruvian guano, without the impurities, and with the ammonia fixed.

MORELLO CHERRIES.—*A Constant Reader.*—In pruning, leave sufficient of last year's shoots, for on such this kind of Cherry bears its fruit. ‖

NAMES OF FRUITS.—*A Pear Fancier.*—1, Easter Beurré; 2, imperfect probably, Ne plus Meuris; 3, Holland Bergamot.——*A. D.*—1, Glout Morceau; 2, Newton Pippin; 6, St. Germain. ‖

NAMES OF PLANTS.—*O.*—Double Daffodil.——*M. Y.* and a *Constant Reader.*—Peziza coccinea: not very uncommon.——*A Constant Reader.*—1, Lasiopétalum solanáceum; 2, A Clematis; 3, Apparently Clerodendrum squamatum; but what a specimen! 4, Linária cymbalaria.——*J. W. J.*—A Clematis, and apparently the hardy C. viorna.——*Pteris.*—A small specimen of Asplenium lanceolatum.

PANSIES WITH DISEASED LEAVES.—There is nothing in your compost that would be likely to affect your plants, and the disease being confined to this particular variety (a seedling) it is fair to conclude that it arises from some constitutional defect in the plant.*

PEACH-TREES.—*M. U.*—Your Royal George Peach-tree, from which the blossom-buds drop off, is perhaps too much heated from being near the hottest part of the flue, in consequence also of which, its roots may have been too dry; or its vitality may have been weakened from the attacks of insects. You ought to shorten much the bearing-shoots, and keep the roots sufficiently moist. ‖

PEARS.—*A Subscriber.*—We have ascertained from the gentleman to whom you applied that the Pears which he sent to a late meeting were grown as follows:—*First quality*—Nelis d'Hiver, on a wall: Passe Colmar, ditto; Reine d'Aremberg, espalier; Glout Morceau, standard. *Second.*—Ne plus Meuris, espalier; Jean de Witte, ditto; Merveille d'Hiver, wall; Beurré Rance, standard; Easter Beurré, ditto. ‡——*A Subscriber.*—The following are select varieties, that are good bearers, and that will succeed well as standards:—Dunmore, Althorp Crassane, Flemish Beauty, Marie-Louise, Beurré Bosc, Fondante d'Automne, Beurré Diel, Louise-Bonne (of Jersey), Hacon's Incomparable, Knight's Monarch, Ne Plus Meuris, Winter Nelis, and Jean de Witte.‡——*J. F. B.*—As many varieties as you can find room for, may be grafted on the same tree. In some cases, a graft of a different variety caused an improvement in the general health and bearing of the whole tree. Weak-growing kinds should be worked so as to occupy a position more upright than those that are strong. ‖

POTATOES.—*Beulah.*—You will have a succession and variety enough, by planting the following:—Early Manly, Fox's Seedling, Taylor's Forty-fold, Leathercoat, Red-nosed Kidney, Irish Cup, and Bread-fruit. The old turf will assist in producing a good crop; but a little manure in addition would be repaid. For two spits 1*s.* 6*d.* and 1*s.* 9*d.* a rod is more than is generally paid. ‖———Z—The Ash-leaved Kidney is one of the best varieties that can be employed for forcing, and likewise for the first crop in the open air. ‡

RASPBERRIES.—*Gonyn.*—You may cut down your Raspberry-canes now, leaving them about 4 feet high, and tying them neatly up to stakes of about the same height. Only 4 or 5 good canes should be left on each stool. ‡

ROCKWORK.—*A. B. C.*—Any rough materials will do, except granite and similar rocks. Near London there is little to be had except the large half-vitrefied masses of bricks in the brickfields. If these are put together irregularly, in a terraced style, they look very well, and grow plants as well as anything, except masses of limestone or sandstone.

ROCK-PLANTS.—*Z.*—The following are 40 plants, that are suitable for a rockwork, viz.:—Rhododendron ferrugineum, R. hirsutum, Arctostaphylos, Uva-ursi, Chamædedon procumbens, Sedum rupestre, S. Forsterianum, S. populifolium, S. villosum, S. hexangulare, Pernettia phillyreæfolia, P. pilosa, Mahonia aquifolium, Ramondia pyrenaica, Soldanella alpina, Androsace villosa, Corydalis nobilis, Phlox ovata, P. subulata, P. nivalis, Vinca minor flore, pleno, Campanula pumila, Gentiana verna, Dryas octopetala, Digitalis lutea, Sibthorpia europæa, Arabis alpina, Draba aizoides, Prenanthes purpurea, P. muralis, Antennaria plantaginea, Gnaphalium arenarium, Ceterach officinarum, Polypodium vulgare cambricum, P. dryopteris, Onoclea sensibilis, Asplenium adiantum nigrum, Pteris caudata, Adiantum capillus-veneris, Aspidium rigidum, A. Lonchitis ‡.

ROOT EXCRETIONS.—*J. T.*—Since the publication of the "Theory of Horticulture" this question has received much attention, and the result is very unfavourable to the existence of such secretions. We will inquire about Beehives.

SOIL.—*J. S. J.*—As a substitute for sand, fragments of sandstone, pounded bricks, or even well-worked cinders would do, though not so well. It is probable that the silex is to a certain extent decomposed by the roots of plants; and therefore siliceous rather than aluminous or carbonaceous materials should be given them. We should also try the effect of adding bricklayers' and plasterers' rubbish, such as is obtained where old houses are pulled down.

VERBENAS.—*J. G. H.*—Procure the following 12 varieties:—Girling's Amethystina, Boule de Feu, Catleugh's Ne Plus Ultra, Youell's Princess Royal, Ivery's Purpurea perfecta, Croft's Formosa elegans, Miller's Blue Queen; Tweediana superba, Atrosanguinea, excelsa, Stewartii, and Hawardii.*

VINES.—*J. R.*—Presuming the roots of your young Vines were in good condition, the shoots, which become dried up on being readmitted into the Pine-stove, must have been injured by the severity of the frosts which occurred in autumn. ‖

YEW HEDGE.—*Theresa.*—Your Yew Hedge may be very much improved by cutting it down to the height you propose; the tops should not all be cut down at once, but rather thinned out at different times; one part of each plant may be cut down this spring, another part just as the buds begin to swell in summer, and the remainder the following season, observing always to leave as many of the little twigs as possible on the old stems, and not to clip the young shoots the first season; in two years you may have the hedge quite green. Open a trench on each side of the hedge and put in some fresh loamy soil, giving the plants a good watering just as they begin to grow in summer, if the weather should prove dry at the time.¶

MISCELLANEOUS.—*Spectator.*—At the Garden of the Horticultural Society young men are received for three or four years, for improvement and final placing, at from 12*s.* to 14*s.* a week, with or without lodging, and always without board. They are received upon the recommendation of Fellows of the Society, and it is generally three years after application is made that the applicant can be received.——*O.*—Ipomœa Bona Nox will flower the first year, if sown early, and well managed; but it is usually regarded as a biennial. The Mesembryanthemum is a tender annual.——*R.*—We cannot entertain either religious or political disputes, which do not the more relate to gardening because gardeners are a party to them. If we did entertain them we should say that you are wholly wrong; for what can be more unreasonable than for a gardener to insist upon following his own religious faith, while at the same time he abuses his master for not hiring men of whose faith he disapproves? If the one is free to choose, so should the other be. Would you insist upon liberty of conscience for yourself, and refuse it to your master? We hope not.——*J. W. T.*—We have had no experience with calico glazed over with Whitney's composition for shading a greenhouse. We, however, imagine that it is too transparent for that purpose. With regard to the exhibitions, see Adv., p. 729, 1843.‡——*H. P.*—Read the article on Cucumbers, at p. 148 in to-day's paper.‡——*Charcoal.*—The fumes from a charcoal fire are injurious to plants.——*Y. G. H.*—Respecting the spot on Camellia leaves, see p. 24 of the present year.‡——*A Subscriber.*—Whitney's transparent composition is advertised at p. 906, 1843. Respecting your Apple-trees, we recommend you to plant dwarf standards.‡——*T. H. Fenn.*—Is answered above. Toads are useful for destroying woodlice.‡——*J. G. H.*—Will find the mode of applying guano to kitchen-garden crops, given in last Number, p. 136.——*A Beginner.*—May use coarse cinder-siftings, for plunging material, over a tank.‡——*M. A.*—Burnett's chloride of zinc certainly preserves canvas well, and we have every reason to believe that it also answers the purpose with timber; but we have not heard of the latter being employed in the construction of hothouses.——*J. T.*—Pray say to what statement about cuttings you allude.——*R. S.*—Give your Tropæolum a good bottom-heat. ‡

ERRATUM.—In Messrs. Youell's advertisement of 2d March, FUCHSIAS should be *per plant*, and not *per pair*.

SEEDLING FLORISTS' FLOWERS.

AZALEAS.—*R. W. and Co.*—The only improvement in your seedling over the old White, is a slight one in the general form of the flower, arising from the segments of the corolla being a little broader, consequently the divisions between them are not so deep; the surface of the flower appears to want smoothness, and the three or four irregular petals in the centre of each is a decided defect.*

CINERARIAS.—*J. C. K.*—The colour of your seedling is very bright and beautiful; but the flowers are rather small, and the petals too narrow *.

*** As usual, many communications have been received too late for answering this week.

PROVIDENCE BARLEY.

MR CHILLINGWORTH, of Cudderson, near Wheatly, Oxon, planted Two Bushels of the above Barley upon 1A. 0R. 27P. of Land, the produce from which was 1Q 0B. 3P. 1G. of Barley, and 2 tons 16 cwt. 3 qr. of Straw, bearing and chaff.

Persons desirous of planting any of the above wonderfully productive variety of Barley, can obtain seed of MR. ROBERT BEMAN, of Donnington, near Stow, Gloucestershire, at 5s. 6d. per bushel for 40 bushels and upwards, and 6s. per bushel if a less quantity is ordered. Cash Payment, or a Good Reference.

N.B.—The Barley is of good quality, and malts well. Donnington, March 9, 1844.

IMPORTANT TO AGRICULTURISTS AND OTHERS.

ANALYSES OF SOILS, MANURES, &c., are conducted by MR. MITCHELL, Analytical Chemist (late of the Royal Polytechnic Institution), No. 5, Victoria Cottages, Hawley Road, Kentish Town.

A vacancy now occurs for one house or outdoor Pupil, for the study of Chemistry as applied to Agriculture. Apply as above.

The Agricultural Gazette.

SATURDAY, MARCH 9, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, Mar. 13 . Agricultural Society of England.
THURSDAY, Mar. 14 . Agric. Imp. Society of Ireland.
WEDNESDAY, Mar. 20 . Agricultural Society of England.
THURSDAY, Mar. 21 . Agric. Imp. Society of Ireland.

THE constituent parts of animals—the substances of which their bodies are composed—we mean the carbon, oxygen, hydrogen, nitrogen, lime, phosphorus, alkalies and acids, &c., existing in various combinations within them, are necessarily all contained in the food which they eat. In the case of herbivorous animals, therefore, it is obvious that their component elements must all exist in vegetables. With regard to plants, their constituent parts also are gathered up from certain sources. One of these is the air, the importance of which in this capacity has within the last few years been fully demonstrated by Professor Liebig; the water contained in the soil is another; all matters dissolved in that water are taken up by the plant and undergo a process of digestion within it. All the matters which a plant contains are soluble in water in certain natural conditions of their existence, and are therefore capable of being taken up by it at its root. Now, as herbivorous animals and plants consist of the same elements, the food received by them must be similar in its composition. We do not now speak of the proportion which the quantities of the various elements of that food bear to one another. In this there is doubtless a difference, and this difference is undoubtedly important in its influence on the processes of nourishment. We refer only to the fact that the same elements, unaccompanied by others, must all be present in the food both of animal and plant. Then why might not animals and plants both live on the same food—food not only the same in chemical composition but also in form and substance? There are various answers to this question, and the following is one of the reasons why this is impossible. The union of those elements which constitute the animal body is very slight; a very slight derangement of ordinary circumstances would cause a partial or entire re-arrangement of those elements, and so induce disease or death. Among the causes (poisons) which are capable of this effect are a class of substances which are not directly poisonous, but which act so in virtue of a tendency in substances that are in contact to acquire a common condition. We know that though but a little leaven be added to a batch of dough, it will spread, and the whole lump will soon acquire the condition of the small quantity which was added to it; and it is upon a similar principle that but a small quantity of matter, if in a decomposing state, whose elements may be identical with those of a living animal, may yet prove the cause of its death, if it be partaken of. The process of re-arrangement proceeding amongst its own elements, which is in fact the process of putrefaction, would communicate itself to the substance of the living body, and the leaven gradually working its way would impress its own character upon the whole mass, rendering it diseased, and ultimately depriving it of life.

The very condition, however, of food, which is thus rendered poisonous to animals, makes it peculiarly suitable for vegetables. Plants cannot consume massive food like animals; they have no mouth which can take it up in such a state, and no stomach in which to digest it. The soil answers this purpose for them, and the organic matters existing there are, under the influence of external agents, gradually losing certain of their elements, which, forming soluble compounds with others, are dissolved by water, and so introduced into the vegetable. This rotting condition—the poisonous state of food for animals—is thus the very condition in which food for plants is most valuable.

We have thus arrived at this conclusion:—there is no case in which food of an organic character, in a condition of usefulness for vegetables, can be safely administered to animals. And the point to which we wish to direct all these observations is simply this: there is, notwithstanding what has been said, an instance of daily occurrence in which such food is administered on many farms to the most valuable stock. We refer to THE CONDITION IN WHICH HORSE-PONDS ARE GENERALLY TO BE SEEN—black from the runnings of stables and manure heaps; and this filthy stuff is confidently asserted by many to be wholesome, and even preferable to pure water as a beverage for their cattle!

We need not quote the analyses of the various matters which thus run into many horseponds: they will be found under the head Liquid Manure, in Mr. C. Johnson's "Encyclopædia of Agriculture:" it is sufficient to remark here, that, besides certain salts of ammonia, which are undergoing various chemical changes, and besides other soluble mineral salts, there is a considerable quantity of purely *animal matter* suspended in this water, which, under the influence of air and moisture, is necessarily undergoing a putrefactive process, and which, if introduced into the animal system in sufficient quantity, must tend to act as a leaven and to introduce that putrefactive process there, perhaps to result in death. But on this very account is this animal matter peculiarly valuable as food for plants, and united, as it is, in liquid manure with ammoniacal and phosphoric salts, it possesses the most fertilising properties. Instead, however, of being used as a manure, it is, on such farms as we allude to, suffered to run to waste; and, of all possible places to which it may run, it is allowed to select the only spot where it can be injurious.

But what a perversion of means is this! Not only is a valuable manure wasted, but it is made use of in a manner having a most dangerous tendency; that which, if applied to the crops on the land, would increase their fertility, is not only allowed to waste, but it is negligently, if not purposely, allowed to run into the very drinking-trough of the cattle—almost the only place in the wide world where it could be injurious. We say "purposely," for it is insisted on by some, that this water is preferred by cattle, nay, that it is beneficial to them. To complete the absolute foolishness of their conduct, those whom we would call *guilty* of it are, in all probability, the very parties who will cry out against what they term the want of economy displayed in erecting necessarily expensive but well-arranged buildings, calculated to hinder such waste as that we have been describing.

The prejudice, however—for if anything deserve the name of prejudice, it is this—that water, filthy from such admixture, is wholesome, seems, from the following statement received from a medical friend, to be in unison with some of the eccentricities of human nature:—"The love of filthy and disgusting remedies seems to have been by no means rare. *Album Græcum* was formerly much used in medicine; it is the white earthy remains of the bones on which dogs feed, after digestion has extracted the whole of the soluble animal matters. *Mummy* used to be a most celebrated remedy for the cure of numerous complaints, and, as it was sold at a high price, some Jews carried on a very profitable business in the manufacture of mummies for medicinal purposes; they had a regular apparatus of ovens and drying-houses for the purpose; the discovery of these, however, destroyed the public faith in the operation of what had previously been one of the most effectual remedies in the whole Materia Medica. A friend told me some years ago that there was a drawer in the shop of an old apothecary to whom he was apprenticed, labelled '*Pulvis e cranio humano*!' *Foxes' lungs* used to be highly celebrated for the cure of the asthma, the fox being a long-winded animal." Then follow remarks on the medicinal properties of matter contained in muck-water:—"The salts contained in farmyard muck-water have almost all of them a slightly purgative, and also, probably, a diuretic action. I should think that until the animals were well habituated to such potations, they would have a strong tendency to destroy or diminish the appetite, and that they would drink a less quantity than if supplied with pure and wholesome beverage. How far the decomposing animal and vegetable substances contained in this water may be capable of communicating their own process of putrefaction to living tissues I cannot tell; but I should certainly fear that such putrefying substances introduced into the stomach would increase any tendency to diseases connected with the state of the blood."

We must add to the above the following statement, received from a distinguished veterinary surgeon; it is upon the same subject—the runnings of liquid manure into horse-ponds:—"I must confess that I have not met with cases of disease that could be attributed to this cause. The urine is doubtless generally in such a state of dilution as not to be prejudicial; for it is to be borne in mind that, in its natural state, nine-tenths of this liquid is pure water. It must be given pure, and in quantity, to produce disease, unless it be in a putrefying state, when a far less proportion would be sufficient." It will be remembered, that it is because it acquires this putrefying state that we insist upon its poisonous tendency. "The effect of water rendered impure by decayed leaves is more injurious than that just mentioned. In Australia there is frequently a scarcity of this fluid, and the ponds become impure from decayed leaves, and an endemical disease of a fatal nature is the result. When water also has been in a stagnant state for some time, it abounds with myriads of minute insects; and there are instances of worms (though not of the ordinary kinds) being the result of drinking the filthy water; and inflammation of the bowels has arisen, and death has also been the consequence in a few instances. Filthy ditch-water, in a state of absolute putrefaction, is still more dangerous; but animals will not partake of it, unless suffering from extreme thirst. Disease of a low typhoid character, soon followed by death, has been the result. In all cases, animals should be provided with water as pure and as soft as can be obtained.—*W. C. S.*" Although the writer of this has never seen disease arising from the causes we refer to, yet the remarks he makes afterwards show that his opinion, valuable as the result of experience, coincides with our own, expressed above, as to the folly and danger of *thus* wasting the valuable parts of the dungheaps, and the runnings of stables and cattle stalls.

WE are now busily engaged in THE PREPARATION OF LAND FOR THE CARROT CROP. That on which we intend growing Carrots this year, is a siliceous sandy soil, sufficiently rich in vegetable matter, and therefore just such as this root likes. It was broken up from old pasture four years ago, having first been efficiently drained. The first crop taken was Swedish Turnips on one part, and Potatoes on another; for both of which it was manured and limed; it was subsoil ploughed in the spring of that year; the following season it bore Wheat, along with which Clover-seeds were sown; the third year it was mown and grazed, and then broken up for Wheat, of which we had last year a heavy crop on it. All this is stated, although it involves matters unconnected with our present subject, just to show the condition in which the land is, and its suitableness for the growth of Carrots.

No principle of any importance is involved in the cultivation of this root, on which that of Turnips, Beetroot, or any other of our green crops does not also depend. There are, however, peculiarities in the cultivation of the Carrot, arising from the character of the seed, the shape of the root, and the early period at which it must be sown.

There are few soils, however severe the frosts of winter may have been, which will not, when ploughed early in March, turn up stiff, so as when harrowed to present a cloddy surface, which is not easily reduced. Now, it is important that the surface should be fine when Carrot-seed is sown; and, therefore, it is a good plan, in order to avoid the necessity of ploughing in spring, to plough in the manure before winter. We read and hear of the Carrot-crop requiring no manure, which the authorities for such statements account for by the depth to which, as it is stated, these roots descend for nourishment. It may be safely admitted, however, as universally true, that all crops require manure, and especially those which we expect to yield a weight of 20 tons and upwards per acre. The manure, which may be that of the farm-yard, should be ploughed under in October, as deep as possible, *i. e.* from 8 to 10 inches under the surface, and the land may then be left till spring. We were unable to do this at the proper time last autumn, not having sufficient on hand, and therefore we are now cross-ploughing our land before spreading the manure, after ploughing in which we shall have to harrow it repeatedly to get it ready for the seed. Had we ploughed in the manure in autumn we might have left the land till the middle of March, and then using merely the cultivator or scarifier, we should have saved the spring ploughings, and there would have been no difficulty in getting the land fine for receiving the seed.

Carrot-seed should be sown during the first week in April. About 5lbs. per acre is the usual quantity. The seeds are surrounded by stiff short hairs, so that they cling together, and in order to enable the farmer to drill them (the common Suffolk drill is used for the purpose), they must be mixed with sand. If the drill be set to sow 2 bushels per acre, 2 bushels of sand must be mixed with 5 lbs. of seed for every acre that is to be sown. It is an advantage to make the seed germinate in the land as soon as possible, and therefore it is well to mix the seed and sand together four or five days before sowing, and to damp them somewhat, so as to swell the seed, and partially to sprout it. Do not *wet* the mixture, merely damp it so that on squeezing a handful it shall preserve its form, and not crumble on opening the hand. If the sand be wet, the drilling-machine will soon choke; it must be spread out as soon as damped, and turned three or four times every day before sowing; this will dry it somewhat, so as to enable it to pass easily through the drill. The seed is drilled on the flat surface in rows, from 12 to 24 inches apart. It is right to adopt such a distance as will enable the use of the horse-hoe, and 18 inches is the least at which this is practicable. We grew them in rows only one foot apart last year; but

at this distance the land could not be cultivated, and could hardly be kept clean; it became very hard, and it was probably on that account that so many roots went to seed. This year we shall adopt an average distance of 18 inches from row to row; but in order the more efficiently to use the horse-hoe, we shall sow the seed in rows alternately one foot and two feet apart; the one-foot interval must be kept clean by hand-hoeing, the two feet interval we shall be able to horse-hoe; and one side at any rate of every row will thus receive the benefit of deeply stirring the land. Whenever the rows can be distinguished, the land should be hoed, and whenever the plants have come into full leaf they should be singled out. The distance at which they should be left may be 8 or 9 inches. When the land is apt to get soon covered with small weeds, not easily distinguishable from the young Carrot-plants, it is a good plan to sow a few Oats along with the seed. The Oats spring up before the Carrots, and point out the position of the future row, so that the land may be hoed when necessary, even though the Carrots are not up, without any chance of destroying the young plants. The summer cultivation of the crop consists in a repetition of the hoeing whenever necessary (this will cost at least 15*s.* per acre), and occasional horse-hoeings to stir the land. All the plants which run to seed should be pulled up whenever they are seen, and they may at once be carried to the yard for the pigs.

The best variety of Carrot for field culture is unquestionably the White Belgian. On suitable land, under good cultivation, the farmer may expect, in ordinary seasons, a crop of this root weighing from 18 to 22 tons per acre. It should be ready to harvest towards the end of October; and before then we shall return to the subject.

ON THE SOIL AND CLIMATE OF THE SHORES OF THE MORAY FRITH, IN SCOTLAND.—No. I.

From the remarks contained in the first two Numbers of your new Paper, on the necessity of a general knowledge of the soil and climate of a district, towards the right understanding of the peculiarities of its husbandry, the public, I trust, may expect soon to find in your columns a series of papers descriptive of all the principal Agricultural districts of the United Kingdom. Without some general notices of this sort, to which we may refer, the vast mass of detached observations accumulating in your pages may become unmanageable, and practices in one district be found quite inapplicable in others. As you will, no doubt, receive many communications from the North of Scotland, which exports a good deal of grain and fat stock to the English markets, and as throughout this district the Lothian system of husbandry is now extensively and successfully followed, it has occurred to me that a short popular account of its soil and climate may not be unacceptable to many of your English readers. In the present paper I will confine myself to the north-eastern side of Scotland, which, in fact, is also by far the most productive and important one; and in a general sense, it may be observed, that the cultivated zone in this district extends only for a few miles inland from the shores of the Moray Frith. In this district examples, yearly increasing in size and value, exist, as I have said, of a successful imitation of the best Scotch or Lothian system of husbandry, with this peculiarity, however, that throughout the Lothians the soil and subsoil have been naturally enriched by the clay and mineral alkalies resulting from the decomposition of the trap and porphyry rocks, which so universally prevail in the Southern Lowlands of Scotland, while in the northern district to which I refer, there are no secondary trap or porphyry rocks of any extent, and the clay which does occur has resulted from the disintegration of primary gneiss and granite and the older felspathic rocks, and from the breaking up of secondary shales and aluminous slates. Stiff clay loams are hence rare with us, while light sandy soils are by far the most prevalent in the Agricultural portions of the north Highlands. This results from the prevalence of sandstone rocks along the whole north-eastern shores of the country; and any deviations from this structure will be readily accounted for by attending to the following slight geological description.

The great basin of the Moray Frith appears to have been at one time filled with strata of the old red sandstone formation, having superimposed upon them members of the Lias and Oolitic series, and of other partial or local deposits as high up as the chalk, but of which latter formations only faint traces are now to be found at wide intervals along the Ross and Sutherland coasts, and in a few detached spots in Moray and Banffshires. The great sandstone pavement itself has been most extensively denuded and cut up by the ocean, so much so that it now exists only as a narrow frame-work to the primitive rocks composing the interior of the country on which it reposes—the inner boundary of the sandstone being an irregular line running generally round the whole coast at the distance of from 2 to 10 miles from the sea, except in Caithness, which county is entirely covered by this rock, whose beds are also prolonged into and constitute almost all the Orkney Islands. In many places, especially in the lower parts of the country, the rocks retain the horizontal position in which they were at first deposited, but in others they are found in undulating lines, and are often contorted and broken up by intruding masses and spurs of granite against the sides of which they are now abutted at highly inclined angles. Near Geddes and Cawdor Castle in Nairnshire, the black rock of Inverfarikaig, and the precipices below Mealfourvonie on Loch Ness, Craigphadrich, near Inverness, the ridge from Avoch to Cromarty, the Ord of Caithness and other picturesque localities, beautiful instances of the intrusion of the amorphous granites among the sandstone layers occur, thus giving rise to much of the irregularity and boldness of our inland fastnesses, and of our projecting headlands and rocky coasts.

The sandstone, or Devonian system, and its associated beds, are divisible into three great groups:—1st. The uppermost consists chiefly of pure yellow freestones, such as those of Bishopmill and Quarrywood at Elgin, which form beautiful and durable building-stones, and which were formerly regarded as the yellow sandstones peculiar to the coal formation. 2nd. Gray and variegated sandstones, with soft bituminous and calcareous shales and flagstones; all highly charged with bituminous matter, the remains most probably of extinct marine vegetables and fishes, of which impressions and scales are still occasionally found. These beds were formerly held as occupying the place, in the north of Scotland, of the true coal formation, though not exactly identical with it; (see Murchison and Sedgwick's papers, in the Geological Society's Transactions, on the Brora Coal-field, &c., and Anderson's Highland Guide, first edition, p. 197); and many attempts have at different times been made to procure coal from the deposit, but without success. 3d. The fundamental rock of the series is the true old red sandstone, with its associated coarse conglomerate, together forming the round-backed undulating chain of hills (often presenting abrupt escarpments and finely-shaped conical summits) which encompasses the whole country, being interposed between the low plains and the high and rough primitive mountains of the interior. This sandstone, which is usually of brick-red colour and of a great diversity of texture and hardness, is by far the most abundant rock in the secondary strata; and is in general a mere agglutination of sand coloured by the red oxide of iron, though in many places it is highly micaceous and aluminous. It is the parent, so to speak, of all the superior beds, which (though at one time it was somewhat difficult to find their true geological position) have, of late, been pronounced as belonging to the same old red-sandstone formation, in consequence of the identity of the organic remains found in both the lower and the upper strata *.

In some few places, as at Linksfield, Inverugie, and Cothall, in Morayshire, and at Helmsdale, in Sutherland, irregular unstratified masses of a concretionary limestone (called cornstone), a deposit most probably from ancient hot springs, occur subordinate to the sandstones, but in general the district in question is devoid of lime; gritty quartz or sand being by far the most abundant ingredient of the rocks.

The distribution, in greater or less quantities, of the several members of the foregoing series, affects much the fertility and outward aspect of different parts of the district around the Moray Frith; and in my next paper I will shortly describe the leading features of each portion of country in which the different members respectively prevail, and then advert to the general covering of gravel which almost universally constitutes our subsoil, and will conclude with a brief sketch of our northern climate.—*G. Anderson, Secretary to the Horticultural and Farmers' Societies of Inverness.*

* The most interesting and beautiful account of the very strange organisms in these deposits occurs in Mr. Miller's "Old Red Sandstone," a work which has justly received the highest praise from the first geologists in Britain.

EXPERIMENTS WITH MANURES.

From the numerous experiments which have been made with different manures in various parts of the kingdom, on almost every variety of soil and situation, it is reasonable to hope that by a comparison of the results obtained by these means, we may arrive at something near the truth, and be enabled to form an estimate of the relative value of the substances that may have been made the subject of investigation. It is with the view of assisting in this important work, that I have received the permission of Sir Charles Lemon, Bart., M.P., to transmit you the following details of some experiments made at Carclew, in 1843, for the purpose of testing, on a small scale, the merits of certain manures, when applied as a top-dressing to growing crops; and although they are far too limited in extent for us to draw any positive conclusions from them, as to the real value or efficiency of any of the substances employed, they will probably be useful in some degree as exhibiting their fertilising powers under circumstances precisely similar in every respect.

The subjects selected for experiment were, 1, nitrate of soda; 2, sulphate of soda; 3, guano; 4, sulphate of ammonia; 5, Stott's soluble manure; and 6, drainings from the farmyard. The field considered as the most suitable for giving the whole a fair trial, was one with a high open exposure sloping to the south, where the soil is a free light loam, averaging about a foot in depth, on a yellow clayey subsoil, interspersed with spar. It had been well manured the previous season, and cropped with Turnips. After these were removed, the ground was ploughed and prepared for Barley, which was sown in the latter part of April. On the 15th May the manures were applied, the tenth part of an acre being allotted for each experiment.

1. *Nitrate of Soda.*—The quantity used was 33½ lbs., which is at the rate of about 3 cwt. per acre. It was sown by hand with the utmost care, so as to distribute it as equally as possible over the plot of ground. Little or no effect was observable for some time afterwards, owing, no doubt, to the unusually cold wet weather, by which vegetation generally was very much retarded. No sooner, however, did it become warm and sunny, than a change was apparent, not only in the more rapid growth of the plants, which soon outstripped those around them, but also in the colour of their stems and leaves, which were alike remarkable, both for their greater size and the rich deep green they subsequently assumed. During the season, this plot maintained its fine healthy appearance, from which I was led to infer that nitrate of soda would prove a most valuable manure; but the result was very different to what I anticipated, the weight of the produce being, in Straw, 199 lbs., in Corn, 178 lbs., which measured 3⅝ Winchester bushels, equal to 37½ bushels per acre, and less by 6½ bushels per acre than any in the series.

I was not prepared for such a difference between the weight of the Corn and Straw in this experiment, and those of the others; and I am quite at a loss to account for the deficiency. The only way in which I imagine it to have arisen, was from the plants having been stimulated by the application to become more succulent and vascular than they would have been under other circumstances; so that when they arrived at maturity, and were cut and dried, the Straw and Grain lost in weight more than their bulk and appearance would otherwise have led us to expect.

2. *Sulphate of Soda.*—The same quantity, 33½ lbs., of this salt was used as in No. 1. The large hard lumps in which form it arrived, were pounded and reduced to a fine powder. It was then sown by hand in a similar way to the preceding, and to the same cause may be ascribed the slowness of its action, no change being perceptible until warm weather made its appearance, when its effects became nearly as striking as in the previous experiment. The plants acquired a dark healthy green colour, and were upon the whole nearly as tall and luxuriant as those treated with nitrate of soda; but here again the produce was less than expected, the weight of Straw being 264 lbs., of Corn 215 lbs., measuring 4 bushels and 3 gallons, which is at the rate of 43¾ bushels per acre. In so far, therefore, as we may judge from the result of these two experiments, it would seem as if neither the nitrate, nor sulphate of soda were adapted for using on thin light soils. It is perfectly true that they act in some way as a stimulant to the growing plant, as shown by the places where they have been used being invariably of a dark healthy green; but I am inclined to think their beneficial effects, if any, will be found to be very transitory, and by no means so wonderful as they have been represented.

3. *Guano.*—The conflicting statements which have appeared from time to time respecting the proper quantity which ought to be applied of this manure, and the failures that have occurred from using it too bountifully, induced me to use a much smaller proportion of it than is now recommended, but, notwithstanding this, its effects were truly remarkable; for, although only 16½ lbs. were sown dry over this allotment, which is at the rate of about 1¼ cwt. per acre, it could readily be distinguished during the growing season from any other part of the field. The corn tillered well, and appeared thicker than in Nos. 1 and 2, and although somewhat shorter, it was in other respects equally strong and healthy, and of a rich deep green. It deserves to be noticed that, at the time of binding up the Corn, the workmen remarked what appeared to them to be a difference in the weight of the sheaves, compared with those in the first and second plots, which they had previously bound up, and the result showed an increase over the nitrate of soda, of no less than 81 lbs. of Straw, and 74 lbs. of Corn; the weight of the Straw being 280 lbs., of Corn, 252 lbs., equal to 5 bushels, or 50 bushels per acre. Besides this experiment, I have made several others with guano in a liquid state, on vegetables in the kitchen garden, all of which have satisfied me that this manure, when unadulterated, is one of the most powerful that can possibly be employed for gardening purposes. Its effects are visible in the course of eight or ten days after its application. For Onions, Celery, and the Cabbage tribe, it surpasses anything of the kind I ever witnessed. I had portions of each of those vegetables watered with guano, without being made aware of the particular spots so treated, and at the end of a week I had no difficulty in pointing out every one of them where the guano had been used.

4.—*Sulphate of Ammonia.*—A small quantity of this salt, prepared by gas liquor acting on sulphuric acid, produced from the roasting of copper ore, was forwarded from Bristol to Sir Charles Lemon for the purpose of experiment, with the following directions:—"The quantity usually applied is about 2 cwt. per acre. Upon Grass-lands or growing crops it may be sown broadcast; or, in preparing the land for seeds, harrowed lightly into the ground; or it may be mixed up in any proportion with soil or any decayed vegetable matter that may be most easily procured." In the present case the quantity used was 22½lbs., which after being reduced and made tolerably fine, was sown by hand unmixed with any other substance. A fortnight after the application I remarked a trifling difference in the colour of the young plants, which seemed to be of a paler green from those adjoining them; but this soon wore off, and was succeeded by a fine healthy green, which they retained during the rest of the season. The Corn was about the same thickness as where the guano was used, and of an average height. The produce gave of Straw, 269 lbs.; of Corn, 232 lbs., equal to 4¾ bush., or 47½ bushels per acre. Between this and guano there is a difference in favour of the latter of 18lbs. in the weight of Straw, and 20 lbs. in Corn; while the difference in the cost of sulphate of ammonia is nearly double that of guano.

5.—*Stott's Soluble Manure.*—This is a preparation somewhat resembling the last, but of what it is really

composed I am unable to say. It was obtained by Sir Charles Lemon, Bart., from G. L. Stott, Esq., of Ashley-hill, near Bristol, and appeared to me, from its smell, to be some substance impregnated with ammonia, on which I conceive its value as a manure principally depends. It was directed to be used at the rate of 1 cwt. to 1000 gals. of water per acre. The quantity which I applied seems to have been rather more than the right proportion, being 12 lbs. to 120 gallons of water, which was dissolved and distributed over the ground with a large watering-pot, without producing any injurious effect; on the contrary, the return of the weight of Corn and Straw proves it to have been one of the best manures in the series, although there was certainly nothing remarkable in the growth and appearance of the Corn whilst growing, to indicate its superiority over the others. It was of an average height, and dark healthy colour, but all the plots were more or less so, and from adjoining one another formed a deep green stripe down the field, which could readily be distinguished from any elevated position where the whole could be overlooked. The only difference in those cases where the return exceeded the average crop appeared to be in the plants having tillered better, and produced a greater number of stems than usual. In this instance the weight of Straw was 288lbs.; of Corn, 257lbs., which measured $5\frac{3}{8}$ bushels, or at the rate of $53\frac{3}{4}$ bushels per acre.

Drainings from the Farm-yard.—The value of liquid manure is well known to gardeners, and there is no reason why it should not become of equal importance to farmers for using on a large scale. The trial which was made of it in this instance was highly satisfactory, and confirms the opinion I have long entertained, that more attention ought to be paid to the proper formation of dung-heaps, as well as to the making and preserving of liquid manure in tanks, &c., than is the general practice. Were this the case, I am persuaded it would be far more advantageous to the farmer, than wasting his money on foreign substances whose virtues, if any, are of a questionable character; or, at all events, not more powerful than those which may be obtained, at much less cost, from other agents within reach, if the means are only adopted to secure them. Here we have the fact of the common drainings of the farm-yard giving a return equal to that obtained from the finest manure of which we have any knowledge. The quantity used was 100 gallons, or 1000 gallons per acre, not in the strong brown coloured state it appears when running from the stables, or cattle-houses, but diluted with water until it resembled what is commonly used for gardening purposes. It is difficult to make the general reader understand this, but I should think one gallon of the dark-coloured liquid, to two gallons of water, would be near about the right proportion. The appearance of the Corn was remarkably strong and healthy. The weight of Straw was 300lbs., of Corn 256lbs., which measured $5\frac{1}{4}$ bushels, or $52\frac{1}{2}$ bushels per acre. If the effects of guano and some of the other manures were such as to excite surprise, I think the result of this experiment will appear no less remarkable, as it supplies us with evidence in proof of the great value of liquid manure, which in too many instances, I regret to say, is either little attended to, or wholly permitted to run to waste. In this particular, I believe it will be generally admitted, there is great room for improvement; and it is to be hoped the time is not far distant when the facts derived from these and similar experiments will be the means of causing a better system of management to be introduced. A portion of equal extent to those allotted for each experiment was set apart for comparison, and found to produce in Straw 233lbs., in Corn 200lbs., which measured 4 bushels, or at the rate of 40 bushels per acre.

The subjoined Table will more readily show the results of the several experiments:—

Table showing the result of Experiments with different Manures applied as a top-dressing to Barley, 1843.

Kind of Manure.	Quantity used on one-tenth of an Acre.	Price.	Produce of one tenth of an Acre.			Cost per Acre.	Rate of Produce per Acre.

ON THE APPLICATION OF CHEMISTRY TO AGRICULTURE UPON RATIONAL PRINCIPLES.—No. IX.

PART III.

(*Continued from p.* 139.)

ON THE CHEMICAL COMPOSITION OF THE FOOD OF PLANTS, AND THE RELATION IT BEARS TO THAT OF THE PLANT ITSELF; FORMING THE BASIS OF THE THEORY AND PRACTICE OF MANURING LAND.

Under this head I also propose to discuss the best means of retaining or increasing the fertilising properties of manures.

Plants having no power of locomotion must have the food by which their growth is supported and their maturity perfected, supplied to them upon the spot where they grow. Now, as the proverb implies, *ex nihil, nihil fit*, as from nothing it is clear nothing can be made, so is it equally certain that the grain, leaves, straw, and roots of a stalk of Wheat, must have derived the material of which their fabric is composed either from the earth in which the roots are planted, or from the atmosphere in which the straw, leaves, and grain grow. Now, we have only to apply the same truth to different parts of which a plant is composed, and instead of saying that as a whole it derives its material from the earth or air, we prove that it must have carbon and the elements of water for its starch and sugar, an addition of nitrogen for its gluten or albumen, phosphate of lime and magnesia for the husk of its seed, and silicate of potash for its straw; and we have only further to prove that these elements must be present for one crop, and with variations or omissions are essential for another, and also that by the addition of individual elements, we can increase the quantity of individual produce, as azote for gluten, carbonaceous matter for starch, and we arrive at once at the foundation of Agricultural Chemistry, at the basis of those great principles which must ever guide the scientific farmer, in a judicious application of the food of plants. A moment's reflection too will convince any one who thinks it worth while to consider the subject at all, that the cause of failure, which we so constantly hear of in the application of manures, arises from the want of attention to these principles.

Let us take an example:—A farmer is anxious to try a certain manure—we will say nitrate of soda or potash; he applies it to his land according to the prescribed rules of so much per acre.

Now the nitrate acts as a manure principally, if not entirely, by supplying the alkali, soda, or potash to the soil. The Cerealia, Wheat, Barley, &c., exhaust the soil of alkali, because a union of it with silicic acid (which is formed of silicon and oxygen) is necessary for the stiffness of the stalk; and this I may observe, *en passant*, is the cause of the green, rank appearance of the corn crops to which the nitrates are applied.

But it may happen, and does frequently happen, that there is no deficiency of alkali in the soil, or that if it did exist, it has been supplied by the usual rotation of crops. Now in such a case it is obvious that the experiment must fail. Another farmer applies it where the alkali is deficient, and it succeeds; hence the discordance in experiments, of which we hear so much.

I will take a second example:—A crop of Turnips or Mangold Wurtzel, or Potatoes, is manured in part with guano and azotised manure, and with good rotten stable manure in part, and the crop from the last-named is the best. Another crop of Wheat, Barley, or Beans, shall be manured in a similar way, and that from the guano succeeds best. Now in these cases the results are strictly in accordance with chemical fact; and yet the experimenter who fails on the Turnip crop, rejects the guano as a useless increase of expenditure in his future operations. There is another source of apparent failure and consequent disappointment in the use of artificial manures, which cannot be too strongly dwelt upon: I mean the fallacy of trusting to appearances in judging of the effect of manures. If Wheat is manured with rotten stable manure and guano, or urine, the plant from the stable manure will have the freshest, greenest, and strongest appearance; but notwithstanding this, the grain from the guano or urine will be the best sample—its quality and quantity will both be superior to that in the other experiment.

Experiment—sound co-operative experiment—as Professor Henslow has so frequently urged, is the means by which these principles can be proved true or false; but no good results will ever be obtained by putting a bushel of this or that manure at random upon the first crop that comes to hand, and judging of the result from mere appearances; on the contrary, much mischief may arise, and a certain retardation of the application of one of the most interesting and important of the sciences to Agriculture. Mr. Pusey was, to a certain extent, right, when he stated that the experiment of the Duke of Richmond was the first real contribution of Chemistry to Agriculture. But this was not the fault of the science, but of those who have undertaken experiments. An experiment, as Liebig has observed, is the expression of a thought; and whether this thought is that of the chemist or the farmer, it is quite impossible to prove its soundness, unless the minutest details are attended to. Professor Henslow's schedule is an example of what ought to be done in Agricultural experiments; and even this will be improved when farmers get into the habit of making themselves acquainted with the true nature of their soils.—*C. R. Bree, Stowmarket.*

(*To be continued.*)

Home Correspondence.

Value of Green Crops.—In your last Paper it appears that Mr. Smith, of Deanstone, estimated at Bristol the value of 200 acres of Oat-straw at from 300*l.* to 400*l.* I cannot make out which sum, as the price per quarter of the Oats is not given. He estimated 100 acres of Green Crop, one-third Potatoes and two-thirds Turnips, at 1200*l.*; 100 acres of Hay at 625*l.*, and 100 acres of Old Field as pasture at 200*l.* Mr. Morton, too, in his Book on Soils has estimated that on the Whitfield Farm, consisting of 240 acres, farmed on the alternate system of green crop and white crop, he may fairly expect to make 922*l.* 5*s.* 6*d.* of corn crops, and 990*l.* a-year from stock. I deny altogether that any such returns can be made from stock, and I call upon Mr. Smith to say whether he, from a farm of 600 acres, has ever realised from cattle, sheep, and pigs, any sum approaching 2425*l.*; and I call on Mr. Morton to say what actual yearly amount he has ever realised from stock on the Whitfield Farm. I have visited the Whitfield Farm twice; I was delighted with Mr. Morton's crops, both green and white Straw. His Corn crops have, I dare say, far exceeded his estimate of their amount. I have the greatest respect for Mr. Morton as a scientific man, and I feel the greatest respect for Mr. Smith, from his having introduced a system of deep draining and deep ploughing, of the advantages of which I have had practical experience; but I think they are both misleading people in putting forth the statements they have done as to the profit to be derived from stock, and I call upon them publicly to rectify their errors, or to give proof that they themselves have made their estimated profit. I farm on the alternate system of green crop and white straw crop; but with a flock of sheep, and with cattle fed in the yards on Straw and Turnips, I cannot make one-half the amount put forth by these gentlemen as the value of green crops; and I believe that for some years past, the Norfolk farmers have barely got paid for the Corn, Hay, and Oil-cake their oxen and sheep have eaten. With beef and mutton at their present prices they do not get one-half the amount put forth by Mr. Smith as the value of a Turnip-crop.—*A Subscriber.* [Did a Subscriber notice that among the expenses was that of dung for green crops —*bought*—put at 10*l.* per acre. The 12*l.*, the value of green crop per acre, is obtained by selling not only the beef or mutton made, but the dung produced also. Of course Mr. Smith did not mean that the dung should be sold or bought, either; but he estimates the total value of all sorts of produce on the one side, as well as the total amount of all expenses on the other.]

Agricultural Improvements.—As agricultural improvement is the order of the day, allow me to mention an extreme case—the expenditure of 5200*l.* on a farm of mine (Tipton Hall, near Kelvedon, Essex), that only cost 3250*l.* In due course, when the results are accurately ascertained, I shall deem it my duty to submit statistical details and drawings of the buildings to every Agricultural Society in the kingdom, in the hope it may give confidence to those who, having the means to improve their property, are doubtful as to such improvements paying a remunerating profit to both landlord and tenant. The expenditure above mentioned has been appropriated to—1st. The perfect and permanent drainage of the land with stones and pipes, 4 yards apart, and 32 inches deep—between 80 and 90 miles of drains. 2d. To the entire removal of all timber trees, which cannot be profitably grown in Corn fields. 3d. To the removing all old, crooked, and unnecessary banks, fences, and ditches. 4th. The cutting new parallel ditches and fences, so as to avoid short lands. 5th. The inclosure of waste, and conversion of useless bog into good soil. 6th. The economising time and distance by new roads, arches, and more direct communications with the extremities of the farm. 7th. The erection of well-arranged farm-buildings built of brick, iron, and slate in a continuous range, excluding all cold winds and currents of air, but open to sunny warmth. 8th. The building a substantial and genteel residence, with all due requisites for domestic comfort and economy. 9th. The erection of an efficient threshing machine, and needful apparatus for shaking the straw, dressing the Corn, cutting chaff, bruising Oats, &c., so constructed as not to injure the straw; avoiding, by its perfect action, that immense waste of grain visible in almost every truss of straw we examine. 10th. The avoidance of thatching and risk of weather, by ample barn room, with convenience for in-door horse labour at thrashing, &c., when not employable without, so as to have no idle days for man or beast. 11th. The saving of every lb. and pint of manure by a tank, (90 feet long, 6 feet deep, 8 feet wide, with slated roof facing the north, and with well and pump,) into which is received the whole drainage from the farm yard and stables. 12th. The conveyance by iron gutters and pipes of every drop of water from the roofs of each building, so as in no manner to dilute the manure in yards. 13th. The perfect drainage of the foundations of the barn, and every building on the farm. 14th. A steam-house to prepare food for cattle. I am thus particular in detail, because it is from each of the above branches of expenditure that some portion of remuneration is expected. But, during the progress of my undertaking I have been warned, entreated, and dissuaded by my farming friends, who protested that a profitable return for such an enormous expenditure was impossible; my calculations, however, were made, and mere assertions without facts and figures weighed nothing with me. Although the operations were only commenced early in 1843, the results, so far as they go, are gratifying and convincing. As one instance of success, a field of Oats sown on the 16th of May, after drainage, was harvested and stacked before another (sown two months earlier on better but undrained land) was ready to cut. Hereafter you shall have detailed statistics of every department in which saving is effected and increase produced. In a moral and social point of view, these improvements have acted beneficially. They have excited the energies of the tenant and his labourers, stimulating them to think, compare, and improve. They have awakened the attention and curiosity of the neighbouring farmers, who are watching the result, and already have they caused many undertakings in drainage, which otherwise would not have been thought of. Had I invested my money in the funds, there would have been an end of the matter; but now I have the satisfaction of having fulfilled a public duty (without injury to myself) by calling into action, temporarily and permanently, a considerable amount of labour. I conceive *that* the highest order of charity which, by providing employment to the willing labourer, confers a favour unseen, and leaves uncompromised (his most valuable privilege) his self-dependence. If every one who has the means follows my example, where requisite, there will be little need to complain of

the want of employment for our peasantry or our capital. —*J. J. Mechi, 4, Leadenhall-street, London.*

On Gorse.—I can bear testimony to the merits of furze as a food for horses, as referred to by "J. Trimmer" in your Paper of the 3d, having seen it universally used in Wales by farmers; their horses are in the most excellent condition, fed on Gorse alone, and have coats as fine as carriage horses. It may be useful to those who may think it well to try the experiment, to describe the mode of preparing it; and to this end I send you a list of the tools used. With these the carter is expected to cut, chop, and entirely keep his two or three horses himself. They are a pair of strong gloves, a reaping-hook (or grass-hook not toothed), a chopping-block, like that of a butcher, with a raised rim of iron round the edge, and a chopper, or bruizer, of which I send you the figure. On every farm a portion of land is left for the growth of Gorse; the last year's shoots only are taken. The cattle take this food in preference to any other, except Oats. I used to buy it chopped, at the rate of three-halfpence a bushel for my riding and carriage horses, by which I gave employment to many an idle boy. On commons the poor might keep their cows during winter in capital condition by the use of this plant. In some places in Wales, where there is a water-power, they have little simple mills for bruizing the Gorse; the crushing apparatus being two wooden cylinders, with iron studs of 3 inches by 1 inch square, which, in the revolutions of the cylinders intersect each other. The Gorse, being laid on the block, is chopped or pounded until it is broken up sufficiently. The head of the chopper is a cylinder of oak, of 10 inches long, and 7 inches diameter; the knives are 6 inches deep (or high) above the surface. This Gorse feeding is a matter of much more importance than may be imagined.—*Wood-end.*

Pig-Feeding.—In fattening pigs I have always found a mixture of Barley and Peas-meal, moistened with milk in sufficient quantity to make it of a drinkable nature, to be the best; the pigs must be rung to make them lie quiet; the sty must be warm and airy, and the sun not suffered to scorch their backs, as thin skinned white pigs are blistered by it, which not only renders them of an unsightly appearance, but retards their thriving; neither can they bear exposure to cold winds, or cold rain, or sleet, or snow, they must be kept out of all these. This is not sufficiently attended to; on many farms you see them lying in heaps shivering with the cold; in such cases thriving is out of the question; and, on the other hand, I have seen them immured to the height of four feet with a low ceiling above them, leaving a space of a foot and a half for a current of air; in this case they looked very delicate and sickly, like consumptive subjects, and never arrived at any size or weight for their age; their constitution was undermined by being kept constantly in a pestilential atmosphere; whereas, had the door been an open-barred door, a current of fresh air would incessantly have set in and purified the place, and given the animals a vigorous habit and a doubly increased size. These extremes should be carefully avoided, and in addition too much cleanliness cannot be observed, for nothing tends more to their well-doing than dry-feet, a dry bed, and sweet air. They wallow in mud it is true in the summer, to get a coat to shield them from the sun and flies; but that only proves that they require protection from excessive heat and the teazing of flies, and all who wish their pigs to thrive will provide shelter. My pigs are never allowed to run about, as no food they can get by prowling about will compensate for the loss of flesh sustained by the continual state of motion. In a farm it may be very well to have some running about to pick up dropped offal, but where the pigs are regularly fed with a sufficient supply, it is a thriftless plan to waste by exercise the flesh that by a state of rest would make a good return for the food consumed and the expense of attendance.—*J. Steele.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Monthly Council was held at the Society's House, in Hanover Square, on Wednesday, the 6th of March; present, the Right Hon. Earl Spencer, President, in the chair, Lord Worsley, Lord Portman, Colonel Austen, Thomas Raymond Barker, Esq., Samuel Bennett, Esq., G. T. Bosanquet, Esq., Thomas William Bramston, Esq., M.P., W. R. Browne, Esq., F. Burke, Esq., Colonel Challoner, F. C. Cherry, Esq., Henry Colman, Esq., H. C. Compton, Esq., M.P., P. Davies Cooke, Esq., Ralph Etwall, Esq., M.P., A. E. Fuller, Esq., M.P., Humphrey Gibbs, Esq., Brandreth Gibbs, Esq., Stephen Grantham, Esq., W. Goodenough Hayter, Esq., M.P., W. Fisher Hobbs, Esq., John Hudson, Esq., W. H. Hyetts, Esq., Sir John V. B. Johnstone, Bart. M.P., Rev. Charles Edmund Keene, George Kimberley, Esq., John Kinder, Esq., Fielder King, Esq., Sir Charles Lemon, Bart. M.P., William Miles, Esq., M.P., Philip Pusey, Esq., M.P., Francis Pym, Esq., Professor Sewell, William Shaw, Esq., John Villiers Shelley, Esq., Edward Solly, jun. Esq., Professor Spooner, W. R. Crompton Stansfield, Esq., M.P., Charles Hampden Turner, Esq., and George Willbraham, Esq., M.P. The following gentlemen were elected Members of the Society :—

Suckling, Rev. R., Duntsbourn Abbots, Cirencester, Glouc.
Spooner, William C., V.S., Southampton.
Wharton, John Thomas, Skelton Castle, Guisborough, Yorkshire.
Wade, Rev. Albany, Elton Rectory, Stockton-on Tees, Durham.
Garland, Joseph, Worgret, Wareham, Dorset.
Berwick, Rt. Hon. and Rev. Lord, Cleveland Row, St. James's.
Thompson, George, Jun., Prestwood, Stourbridge, Worc.
Rous, T. B., Court-y-Rala, Cardiff, Glamorganshire.
Townshend, Lee Porcher, Wineham, Northwich, Cheshire.
Symonds, John, Broad Windsor, Beaminster, Dorset.
Samson, Thomas, Kingston-Russell, Dorchester, Dorset.
Vaizey, Joseph, Whitcombe, Dorchester, Dorset.
Homer, John, Martinstown, Dorchester, Dorset.
Long, Francis Stephen, Bulford, Amesbury, Wilts.
Cantrell, Charles Seward, Jun., Old Windsor, Berks.
Loader, Caleb, Gomeldon, Salisbury.
Nockolds, I. A., Stanstead, Essex.
Havers, William, Bacon's Farm, Mountnessing, Ingatestone, Essex.
Foakes, Charles L., Ramsden-Bell-House, Billericay, Essex.

The names of twelve Candidates for election at the next meeting were then read.

Finances.—Mr. Raymond Barker, Chairman of the Finance Committee, presented the Report of the receipts and expenditure of the Society during the previous month, and of the several cases of defaulters whose subscriptions were in arrear. The Council having confirmed the preceding part of this report, proceeded to take the concluding portion into mature deliberation, and at length agreed unanimously to the following Resolution :—

"That a professional person shall be appointed to write letters demanding arrears of subscription to all such parties as shall be designated from time to time by the Finance Committee; and in the case of such applications not being successful, to take further legal steps for enforcing the payments due."

Southampton Meeting.—Mr. Miles having reported to the Council his communications with Colonel Henderson, Mayor of Southampton, in reference to the notice of motion given by Mr. Shelley, at the previous Council, of which he (Mr. Miles) had been the chairman, Mr. Shelley proceeded to state the grounds on which he had given such notice of his intention to submit to that meeting a motion for the re-consideration of the place at which the Country Meeting of the present year should be held. He detailed at considerable length the whole succession of proceedings which had taken place in reference to the arrangements which had been attempted to be made in the definitive settlement of the various points connected with the business of the Meeting, a practical difficulty having been started on almost every question regarded by the Society as finally concluded; and he had consequently felt it to be his duty, as one of the Stewards appointed by the Council, to lay before them at their present Meeting, the whole state of the case, in reference to the points on which such difficulties had been raised. Having done that, he was happy to find that a deputation of the Authorities of Southampton was then in attendance, and prepared, in their interview with the Council, to submit such terms for their acceptance as would render the further proceedings in the arrangements for the Southampton Meeting both satisfactory and secure. Communications from his Grace the Duke of Richmond, Mr. Mayes, the chairman, and Mr. Trew, the treasurer of the committee of the town and neighbourhood of Southampton; Mr. Bulpett, late Mayor of Winchester, and Mr. Burn, high-constable of Brighton, having been laid before the Council, the following deputation from Southampton were received, namely :—

Col. Henderson, Mayor of Southampton.
Edward Mayes, Esq., late Mayor and Chairman of the Local Committee.
Geo. W. Johnson, Esq., Hon. Sec.
Thomas Trew, Esq., Treasurer.
W. C. Spooner, Esq., and
John T. Ekless, Members.
} of the Local Committee.

The deputation having been received with every mark of respect by the President and Members present, proceeded to express the regret they felt in common with the inhabitants of Southampton and its neighbourhood, that any difficulty should have arisen in the practical details connected with the arrangements for the ensuing meeting in that locality. The Mayor could assure the Council that the occasion of that meeting was the subject of the most lively interest to every person within that district, and the mere apprehension of a removal of the meeting to another place would occasion not only severe disappointment but considerable loss both to individuals and the railway and other companies, all of whom, in anticipation of the occasion, had gone to considerable outlay in providing accommodation of every kind for the numerous visitors expected to be present. The deputation, in conclusion, submitted to the Council the choice of various propositions which they were authorised to offer for their acceptance. The deputation having retired, the Council proceeded to discuss in detail the subject of the propositions then brought before them; and on the return of the deputation to the Council-room, the following stipulations were unanimously agreed to by all the parties present, viz. :—

1.—The Council accepts the 1000*l.* paid into the hands of Messrs. Drummond by the Southampton Committee, for the use of the Royal Agricultural Society of England.

2.—The Southampton Committee are to provide and prepare in a satisfactory manner, from the three sites offered, such sites as shall be determined upon by the Council for the show-yard and pavilion, free of all expense.

3.—The Southampton Committee shall guarantee the use of the Victoria Rooms and grounds; the Guildhall and its house, and other rooms; the registration of lodgings; the lands already selected for the trial of implements and experiments—free of all expense.

4.—The Stewards and Directors shall proceed to-morrow to Southampton, to select the different sites, and report the same to a special council on Thursday, the 14th of March, for confirmation.

The Mayor expressed to the Council the satisfaction he felt in this final decision respecting the place of the meeting, and the stipulations then agreed to, the communication of which, on his return to Southampton, would, he knew, occasion the most lively gratification throughout every class of the inhabitants, who were fully prepared in every way to greet the Society at its ensuing meeting in the most cordial manner. The deputation having withdrawn, the Council proceeded to receive from Colonel Challoner, the vice-chairman of the General Southampton Committee (in London), the Report of their proceedings during the preceding month. The following programme, prepared by the Committee, was approved and adopted by the Council.

Programme of the Arrangements of the Society's Show at Southampton.

Thursday, July 18.—Last day of receiving Implements, Wheat, Barley, Seeds, &c. to be exhibited in the Implement-yard, and arranged by the Stewards for the Judge's inspection.

Tuesday, July 23.—The Implement-yard open to the public from eight in the morning till six in the evening, at 2*s.* 6*d.* each person. The public exhibition of the working of the Implements to take place at Mr. C. Gaters', Swathling Farm, at twelve o'clock. Cattle received in the Show-yard from eight in the morning till four in the afternoon.

Wednesday, July 24.—The Judges inspect the Stock, and award the Prizes. The implement-yard open to the public from eight in the morning till six in the evening. Admission, 2*s.* 6*d.* Council Dinner in the Victoria Archery Rooms, at Five o'Clock; when the Judges' award of prizes (with the exception of those for Horses), will be read. Doors open at four.

Thursday, July 25.—The cattle and implement-yards open to the public from six in the morning till one o'clock in the afternoon, admission 2*s.* 6*d.*; and from one, till six in the evening at 1*s.* Dinner of the Society in the Great Pavilion at Four o'Clock. Doors open at Three.

Friday, July 26.—Cattle-yard open at seven; sale to begin at Nine for Ten o'Clock precisely.

Stewards of Departments.—*Cattle,* Hon. Capt. Spencer, Mr. Druce, Mr. H. Gibbs; *Implements,* Mr. Miles, Mr. Shelley; *Finance,* Colonel Austen; *Sale of Tickets,* Mr. Wilson; *Receipts and Admission to Show-yards,* Mr. Barker; *Pavilion and Council Dinners,* Col. Challoner; *Ladies' Gallery,* Mr. Etwall; *General Arrangement of Show,* Mr. B. Gibbs.

By order of the Council, Jas. Hudson, Sec.
London, March 6, 1844.

By the 15th Regulation of the Society, all persons admitted into the Show-yard shall be subject to the Rules, Orders, and Regulations of the Council.

N.B.—Sale of Tickets for the Pavilion Dinner to Members of the Society at the Pavilion from Nine until Four o'Clock on Wednesday, the 24th of July, and from Eight until Three o'Clock on Thursday, the 25th of July—Price 10*s. each.*

Implement Regulations.—Mr. Shelley, as Chairman of the Committee for taking into consideration the best mode of arranging and adapting for immediate publication the Regulations for Implements at the Southampton Meeting, proposed by Mr. Miles and Mr. Gibbs, reported to the Council the resulting schedule of regulations, unanimously agreed to by the committee. The Council adopted this report, and ordered a copy of the regulations to be sent by post to each exhibitor of implements at the Bristol and Derby Meetings.

Annual Country Meetings.—The Council resolved, on the motion of Mr. Miles, that in future all replies to queries on the subject of the capabilities afforded by any particular locality for holding the Annual Country Meeting of the Society, and required by the order of Council in December 1841, prior to the selection of any town for such place of meeting; and all applications made to the Council in favour of particular towns within the district of any particular year, shall be laid before the Council by the first Wednesday in April of the year preceding that in which the meeting is to be held, in order that the Council may be enabled to ascertain by personal reports the actual facilities and capabilities of each proposed locality before their final selection, agreeably with the bye-laws, on the first Wednesday in the May ensuing.

Mr. Miles also gave notice that he should move at the next monthly Council: "That in future the place of holding the annual country meeting shall not be decided upon until a Committee (of whom at least three shall have acted as Directors or Stewards of the yard) shall have visited and inspected the several towns and their localities, and have reported upon their respective fitness for the purposes of the Society."

Prize Essays.—The Sixty-five Essays reported by the Secretary as received by the 1st of March, in competition for the Prizes offered for the present year, were referred by the Council to the Journal Committee.

Farm-yard Manure.—Mr. Pusey, as Chairman of the Journal Committee, has reported the adjudication of the Society's Prize of 15 Sovereigns, for the best Essay on the Mode of Management and Application of Farm-yard Manure, to Mr. John Clarke, of Long Sutton, Lincolnshire.

Communications were received with thanks from Mr. Colman, Mr. Isaac Clapp, Mr. Denison, M.P., Mr. Purchas, and Mr. Falconer.

The Council then adjourned to Wednesday next.

ROYAL AGRICULTURAL IMPROVEMENT SOCIETY OF IRELAND.

At the meeting of the Council on the 29th ult., the Secretary stated that he had addressed a circular letter to the foreman of the different grand juries in the province of Leinster, requesting them to originate a local subscription in their different localities, for the purpose of defraying the expenses of the next great Cattle-show of the Society, in Dublin, in August, similar to the funds which were raised in the provinces of Ulster and Munster for the same purpose. His Grace the Duke of Leinster had intimated his intention of contributing 200*l.* upon the occasion, and other large proprietors had communicated their intentions of contributing liberally also. Replies were received from 40 local societies, complying with the terms of the resolution for qualifying them for the central society's premiums this year. It was expected that almost all the existing local societies, now amounting to 100, would be enabled to qualify before the 1st of May next. The committee, upon the reports on thorough draining, for the Society's gold medal, reported that they had selected the four first competitors in point of quantity, pursuant to the terms of the original article, namely, Lords Dufferin and Claneboy, Ballyleidy, 154 acres—John Andrews, Esq., Comber, 129 acres—Sir Richard A. O'Donnell, Bart., Newport, Co. Mayo, 127 acres, and the Earl of Courtown, Co. Wexford, 104 acres; and, as all these lots professed to be equally well executed, and strictly according to Mr. Smith of Deanston's principles, it was resolved to apply to that gentleman himself, to know whether he could conveniently undertake the personal inspection of these four different places, in order to ascertain whether, in his judgment, they had complied with the terms of the original resolution, and the secretary was directed to communicate with Mr. Smith for the purpose. The reports of the different competitors were most elaborate, and carefully prepared, and, it was thought, would form a foundation for a most valuable volume of the Society's Transactions for the present year. The secretary laid the balance-sheets of the receipts and expenditure of the Society, for the year 1843, on the table, as prepared by Mr. Corlett, the accountant appointed for the purpose, which was ordered to be referred to the finance committee, previous to the next half-yearly meeting of the Society, which was fixed to take place on Friday the 19th of April.

FARMERS' CLUB.

Chepstow, Feb. 26th, 1844.—The subject for the evening's discussion,—*the best manner of cultivating Sainfoin, and the land best adapted to its production*,—was introduced by Mr. C. Blunt, who said, "I consider that a great deal of the stony, hilly land in this neighbourhood ought to be cultivated with Sainfoin; I know from experience that it would pay better under that crop than any of our meadow land. To grow it successfully a dry soil is indispensable, and with that proviso it will flourish on most soils. I do not know if thorough draining will sufficiently alter the nature of Clay so as to adapt it to the growth of Sainfoin, but I think such land could never be made so congenial to the habits of this plant as the other descriptions of soil. The first step in the cultivation of Sainfoin is thoroughly to clean the land intended to be sown. The best manner of putting in the seed is with a spring crop of corn, neither too early nor too late; because I have found the young plant, just as it comes out of the ground, is too tender to bear frost; and if late, and dry weather should set in, the seed is very apt only to vegetate partially. I think it may be sown any time from the beginning of March to the middle of April. The best way of putting the seed in the ground is to drill it 6 inches wide, because when sown broadcast it is difficult to cover. I should recommend 4 bushels per acre to be drilled, and 5 bushels to be sown broadcast; and I think it better not to sow any clover or grass seeds with the Sainfoin. The crop should be allowed to stand for seed the first year, and not be cut too low. I am of opinion there cannot be a more useful grass. It is invaluable for lambs in the fall of the year, but should never be grazed in the winter or spring. It not only prevents the lambs from scouring, but I have often cured some of this complaint by putting them on the Sainfoin. It is very early at harvest, and very easily made into hay, in good weather only requiring to be turned once; and it should not be shaken more than can be avoided. It should be cut for hay when in full blossom, at which time the flowers are red, and as soon as they turn blue the hay is fit to carry. It is not liable to heat in the stack. It will last many years mowed every year, without manure, and when broken up will leave the land in much better condition for Corn than when laid down. I recommend none but new seed to be sown; the husks of old seed become so tough as to prevent it from vegetating. I consider the crop to be in its prime about the fifth year, though it will last as good for several years. I have grown about 25 bushels of seed to the acre, and have found the straw excellent to cut for horses after thrashing out the seed, and sheep will eat it much better than clover, owing to the stems of the Sainfoin being sweet and the clover bitter."—Mr. R. Phillpotts recommended yellow Trefoil to be sown with the Sainfoin, because it insured a crop the first year and then died off without injury to the latter. Another member said he once sowed red Clover with Sainfoin, and had a good crop of the former the first year, but the latter never came to anything, which he attributed to being injured by the clover.—Mr. C. Townsend said he had sown the worst piece of land on his farm with Sainfoin, and had cut three waggon loads of hay per acre every year since. Mr. Blunt added in conclusion, that Sainfoin would do very well on stony land if the roots could get between the stones; but if the soil were very thin, on a flat rock, it would be likely to burn up in the summer. — *A. Hall, Hon. Sec.*

St. Austell.—At the late annual meeting of this Club, Mr. Karkeek delivered a lecture on Organic Chemistry in its relations to Breeding and Feeding. He detailed and illustrated at considerable length Liebig's views on this subject. In the conversation which ensued at the close of the lecture, he stated his belief that there are perhaps as many good horses now as there were 50 years ago; but the number of bad ones had greatly increased. M'Culloch had stated there were 1½ million of horses in Great Britain; and he believed he should not be far wrong in affirming that two out of every ten were not worth the food they consumed. He believed also that 8 good horses would do more work than 10 bad ones. (A member called out, "More than 20.") If by an improved system of breeding, and the introduction of better horses, they could get rid of only one horse out of 10, there would be a saving to the country, in the rearing only, of more than 2,000,000*l.* a year, reckoning the cost at 5*l.*, a year; and an equal amount would be saved annually after the rearing to 3 years old, supposing the cost of keeping the horse to be 15*l.* per annum. In reply to Mr. Prater's observations, Mr. Karkeek gave it as his opinion that a two-years old filly was too young to breed from. Her powers were not properly matured. He thought they ought not to breed from a mare under three years old. With reference to the Yorkshire horses he said, that at the last meeting at Doncaster of the Breeding Society, they boasted of their having the best sheep and cattle in the world, but actually acknowledged that their breed of horses had deteriorated very considerably within the last few years.

Probus.—At the last meeting of this Club, in consequence of the absence of the member whose place it was to introduce a subject for discussion, the attention of the Club was directed to some experiments reported in this Paper by Dr. Lyon Playfair (see page 59) which had been lately instituted on "Whitfield Example Farm," by Lord Ducie, on the feeding of sheep in sheds. Mr. Doble, of Barteliver, stated his intention to test the accuracy of this experiment on his farm, and sheds will soon be erected for the purpose. There cannot be a doubt that the exposure to the cold winds abstracts the heat rapidly from the bodies of animals, and consequently a much larger supply of food is requisite to support the proper temperature, which excess of food, as Professor Playfair has plainly shown, is entirely lost to the farmer and the country at large.

Reviews.

Treatise on Alkali as a Manure, showing its Cheapness and Efficiency for increasing the Productiveness of the Soil. Dedicated by permission to the Right Hon. the Earl Spencer. By Hugh Waterton, Esq. G. Philip, South Castle-street, Dublin.

This pamphlet contains some useful ideas on the subject of manures, which we do not remember ever before to have met with. We do not allude at present to what the author states of the action of common salt on the ammonia arising from dung-heaps. He is wrong in some of his chemical statements. Ammonia is *not* a compound of hydrogen, nitrogen, and carbonic acid. This is the composition of its carbonate. And with regard to the alleged action of salt on this substance, to which a prominent place is given in this pamphlet, as we hope shortly to adduce evidence of high chemical authority upon the subject, at present we leave it. Neither do we speak of the importance which the author attaches to the alkaline bases of most of the artificial manures, to the comparative exclusion of their nitrogenous ingredients, except only when occurring as ammonia or its salts. In this we believe he is wrong—the nitrogen contained in nitrates of soda and potash contributes to the value of these manures, more or less than the alkalies united with it, according to the condition of the land to which they are applied. The relative value of the different portions of any food, whether given to plant or to animal, is not fixed, but depends upon the wants of the plant or animal, and on the nature and quantity of the food already supplied to them. But we refer to remarks made towards the close of the pamphlet, upon the economical application of manures. We all acknowledge, in the case of the tradesman, that it is his interest to turn his money over as often as possible during any given period; and though this truth is equally applicable to the farmer, yet in practice he seems to deny its applicability.

"It is a common observation amongst farmers to say, 'I have given such a field a dressing it will not forget for years.' Upon reflection it must strike any one that this is a most improvident mode of proceeding."

It is so for two reasons: 1st, because as the author immediately states, the manure, if not all absorbed by the crop to which it is applied, is liable to waste during periods when the land is not under crop; and 2nd, because that portion remaining in the soil after the first crop is so much capital lying useless till the second and third or fourth crop, before which it is not all consumed. Hear Mr. Waterton:—

"The practice of using strong and lasting manures, as they are termed, has generally been most approved; and the artificial or highly concentrated substances, which have lately been introduced, have failed to give satisfaction to the Agriculturist, from their evanescent nature, and from the supposition that they exhaust the soil. The small cost of these substances is overlooked, and, because they act but for one year, they are turned aside as new-fangled things, fit only for the experimental farmer. It is the general usage to put bones upon land in such large quantities, that they are, from the great expense thus incurred, out of the reach of the majority of our farmers, and landlords are often compelled to advance the requisite capital. If another mode of applying the bones were adopted, this would not be necessary, and the gain to the farmer would be considerably greater than it is at present. Ten or fifteen per cent. is generally given by tenants for the advance of capital to buy bone waste, and the virtue of the bones is said to last fourteen or fifteen years. Now it is quite certain that if the land derives benefit in the fifteenth year after the bones have been used, it must be that some of them have remained all that time undecomposed, and, consequently, fourteen years must have elapsed without any good result, except from the portion that has annually been absorbed by plants. If 100*l.* is laid out in bones, and fifteen acres of grass are top-dressed with them, and their effects are visible for fifteen years, the first return of profit can only result from that portion of the bones that has become immediately decomposed, and entered into the composition of the plants; and suppose that portion to be one-fifteenth part of the bones, then 6*l.* 13*s.* 4*d.*, or one fifteenth of the capital borrowed, enables the farmer to pay the interest agreed upon; the remaining fourteen parts having to wait each succeeding year till the whole quantity has been decomposed. Now if the 100*l.* worth of bones were so prepared as to come into operation all at the same time, 225 acres, or fifteen times the usual quantity, could be top-dressed, and the return for the capital would be 225*l.* However exaggerated this statement may at first appear, nevertheless it is perfectly true, and must be the consequence of employing substances that require years to convert them into food for plants. So sensible are the Dutch and Belgians of the advantage of supplying their land annually with manure ready for immediate use, that they take great pains to prepare every substance that can be used with advantage, in such a manner as to be made available by the crop intended to be sown; and where circumstances will allow them, they supply the plants themselves rather than the soil."

These are very useful remarks, and ought to be influential. We certainly should not like our land to be *wholly* dependent, for the crop it bears any year, upon the manuring we had given it that year. There must always on well cultivated farms be *a certain amount* of capital invested in cultivation, which lies dormant from year to year—which the farmer in part invested when paying his predecessor for the cultivation in the land, as it is termed, and which he expects to receive again only when he gives his farm into the hands of his successor. But there is no necessity for his investing, besides this necessary sum, an annual amount in the purchase of manures, applied in such form and quantity that the profits resulting from them shall not be fully obtained till 10 or 15 years have run their course. He has already invested a considerable sum, which is now lying idle; he surely is not anxious to add to that sum, and allow the increase to lie as long dormant as that to which it is added.

With regard to this work generally, the one prominent idea which runs throughout it, is the alleged action of common salt on the carbonate of ammonia, erroneously called "ammonia" by the author. On the subject of this action he ought to have adduced specific evidence, as he must have known that it is disputed. It was too much to suppose that farmers would wholly change their present mode of managing manures upon a statement (whether of a fact or not we do not now stop to inquire) brought forward unsupported by evidence of any kind.

Miscellaneous.

Application of Liquid Manure.—Put it into a large barrel, and sprinkle it upon the thinnest or shallowest parts of the field lying nearest to the steading, in a way similar to the plan adopted in watering the streets in large towns. The way in which I have myself applied it is as follows:—I annually carted from a moss lying on the side of the river Tweed, from 150 to 200 square yards of the moss. This I lay down in a long heap wherever most convenient, along each side of which I place lime, amounting from 60 to 80 bolls. I then mince the moss and mix it up with the lime; in that state it is allowed to lie for nearly twelve months, after which I put it into the artificial pit formerly mentioned, where it remains for about another twelve months, or until it is required for manure to the Turnip crop. During this period, the urine, which the manure cannot absorb, escapes by the covered drain, and is spread over the mass in the pit by means of wooden conductors, or small drains cut on the surface, changing them as circumstances may require, until the whole mass is thoroughly saturated. I shut up the drain of communication in the month of April, when I again turn over the moss in the pit, which has a tendency to pulverise and reduce it. For some years past the moss has been nearly exhausted, and as a substitute for it, I have been in the habit of lifting the soil from the foot ridges, these, from the constant carting on them, being of little value. The only difference of preparation is, that the earth may at once be carted to the pit, and there mixed with lime, whereas it is absolutely necessary, in the case of the moss, that its antiseptic qualities should be counteracted before being subjected to the urine, as I have found from experience, unless that is done, it neither decomposes nor absorbs one-third of the urine in the same time. Where good moss can be procured, I would give it the preference, from the facility with which it is dug out; besides, in its natural state, it is much lighter, and altogether free from stones. I also find that moss, when prepared as above, absorbs more urine in a given space than earth can. This process I repeated every year previous to the introduction of bone manure, but since then, from the great weight of the compost, I never apply it, save to the knolls or light

land lying in the vicinity of the steading, using bones on the more distant parts, so that, generally speaking, I only empty the pit every alternate year. The mode I apply it on the steep land, is to lay it down in heaps with as much regularity as the nature of the ground will permit, then commence spreading it on the surface in the same direction I intend running the drills. The plough follows closely after the spreaders, collecting the compost into the centre of the drills by going once round them. Its application on level land is the same as other farm manures. Having accidentally mentioned bone manure, I beg to state the following as bearing upon this subject, and which was communicated to me by a farmer in this district. Last season he applied urine to his bone-dust in such quantities as not to prevent, but encourage, fermentation. In the course of three or four days he turned over the bones again, saturating them with urine. In this state they were put into the drills; the result of which was, that the bones thus prepared produced a much heavier crop of Turnips than where the same quantity was applied to land of the same quality, and sown at the same time without any preparation, so much so, that it was apparent to the most casual observer. Whether this was to be attributed entirely to the effects of the urine, or other causes combined, I shall not presume to say.—*Mr. Alexander, Easter Haprew, Peebles.*

A new Insurance Company.—A meeting was lately held for the purpose of forming a mutual insurance company, to be called "the Vale of Aylesbury Association to protect the Property of the Members from the now prevailing Distemper, the *Pleura Pneumonia*," which in the last season has become very general amongst cattle. Some graziers in the neighbourhood have suffered to an alarming extent. The society is based upon the one formed at Sudbury, and has, with a few alterations, adopted their rules. The meeting, which was numerously attended, was presided over by Mr. J. K. Fowler. A secretary was appointed at a salary of 15*l.* per annum, and the society may now be said to be in operation. The subscriptions are in accordance with the number of cattle entered by each member, which are insured by a payment of 1*s.* per head per annum, to be paid in half-yearly payments to the treasurer, Mr. Wing.—*Aylesbury News.*

Prevention of Potato Failure.—My seed-Potatoes last year (1842) were raised before they were perfectly ripe, and I have had no failure. Nearly all the seed I planted this year, however, was the small unsaleable tubers planted whole, rejecting the very smallest. The crop was very healthy and productive. Indeed I have never seen a failure where small Potatoes uncut are used for seed; and I believe this uniform success to arise from the small Potato being unripe when taken from the ground. This opinion rests on the assumption that all the small Potatoes of a crop have not reached maturity when the rest of the crop is ripe, as being the last formed. If this be so, it strengthens the common opinion that the less ripened Potato of the upland districts makes the best seed. But at the same time we see how good seed may be had without the trouble or expense of a change from a late district, if we either plant the small Potatoes of our own crops, or raise a portion for seed before they have reached maturity.—*Mr. Caird, in the Journal of Agriculture.*

Coal Tar as Manure.—A communication was read at the Bath Agricultural Society on the subject of the value of coal tar as a manure. The writer stated that in 1840 he published his experience on the subject; he had now used it as a manure for seven years, and had never found it to fail when properly applied. By means of a water-cart he distributed over his Wheat-stubble 180 gallons to the acre, allowing it to remain there two or three months in the autumn before being ploughed in. Its cost was a half-penny a gallon; it was economical, and valuable for Carrots, Turnips, Potatoes, and all roots. He had tried it on seeds, but not with equal advantage on Wheat. It was very useful on a sandy loam, resting on a marl subsoil; next to that, a deep clay land was best; but its least beneficial effects had been upon soil resting on an oolite formation.

Sale of Grain by Weight.—Before the introduction of this system, the farmers were often inattentive to the degree of preparation that was necessary, in order to remove all the light grain, and the most experienced may be deceived by grain appearing plump and round, yet found deficient in weight, and consequently in real value; but the corn-merchant has more confidence to give a good price for a good sample when he is fully assured that it is not at all deceptive. I am also a farmer myself, and can state with perfect confidence that to the farmer the system has been most beneficial; it is not only a guarantee that any trouble he may be at to cultivate and prepare a good sample of grain will be rewarded, but it also induces him to adopt the best method of producing it.—*Mr. Cruickshank.—Dublin Farmers' Gazette.*

Notices to Correspondents.

Rural Chemistry, By Edward Solly, Esq., F.R.S., Experimental Chemist to the Horticultural Society of London, Hon. Mem. of the Royal Agricultural Society, and Lecturer on Chemistry at the Royal Institution, has been reprinted from the *Gardeners' Chronicle*, with additions, and may be had of all booksellers, price 4*s.* 6*d.*

Our Correspondents will oblige us by not mixing together Agricultural and Horticultural questions, and by writing them on one side of the paper only. Such precautions can give them no trouble, and will save us a great deal.

Books.—*A Subscriber.*—Low's "Practical Agriculture," Martin Doyle's "Practical Husbandry."——*Northumbriensis.*—1. Lindley's "Introduction to Botany," McGillveray's "Withering;" 2. Reid's "Chemistry of Nature," Dr. Reid's "Elements of Practical Chemistry," Lyell's "Elements of Geology," De la Beche's "Manual of Geology," Morton on "Soils," and Jameson's "Mineralogy." Thanks for your suggestion.

Burnt Chalk.—*Novice.*—Sprengel states that unburnt chalk has the same effect as if burnt, only in less degree. The process is more tedious, but the larger quantity of chalk which is applicable at the same expense would probably compensate for the slowness of its action. If your land be already calcareous use burnt chalk; if it do not contain lime use unburnt in large quantity. If your land is sour from wetness, the only remedy is drainage.

Dairy Management, &c.—*A Somersetshire Man.*—Confining cows entirely to the house tends to weaken their constitution, and renders them liable to disease. The same quantity of food given under these circumstances will increase the growth of fat, but will not diminish the yield of milk. Such a diminished quantity should be given as will keep them in the same condition as they were in when feeding in the fields. Soiling cows is a practice more suited to arable lands than to permanent pasture. The cheapest way of burning clay is, not in kilns, but in large heaps, as is done on the railways. See answers on this subject above.

Diarrhœa.—*A New Subscriber.*—Your statement is very curious. Give us full particulars, and describe cases, and we will lay the matter before a competent person.

Dibbling Turnips.—*Don Quix.*—We never knew an instance of the seed being dibbled. Your distance ought to be at least 10 inches. Don't know what price per acre should be given. Watch a boy at work at it for half an hour, and calculate the price per acre from what he does.

Disease amongst Young Stock.—*J. L.*—Next week.

Drainage.—*J. Cl.*—We shall notice your work as soon as possible. We propose taking up the general subject shortly.

Farmers' Capital.—*Constant Reader.*—Your request has been forwarded to Mr. Morton.

Fences.—*W. W.*—Holly will effect your purpose, but it takes a long while to grow. Furze will do, but you must keep it down, or it will spread. It is a good plan to have a close cut Quick fence round the wood, and to make it ornamental by planting Laurels, Broom, Furze, &c., irregularly a perch or two wide in the field side of the hedge.

Garlic.—*E. S. W.*—You must dig each root out; or, if there is much of it, break up the Grass, fallow it well, and lay it down again.

Guano.—*Goryn.*—Hoe it in between the drills of Wheat some time this month; 2 to 3 cwt. per acre is the usual quantity. English oil-cakes weigh about 3 lbs. a-piece.

Haymaking Machine.—*A Sussex Subscriber.*—That invented by Salmon, of Woburn, and improved by Wedlake, of Hornchurch.

Laying down Grass-land.—*Novice.*—We hardly know how to improve on your plan. Your land being near the salt-water, needs no muriate of soda. Apply guano rather. If you lay your Grass-seeds down with a crop of Corn, should it turn out wet weather, a heavy crop of Straw would spoil the Grass.

Liquid Manure.—*A. H.*—Add sulphuric acid till effervescence ceases. Any of the soluble salts commonly used in manures would, each under special circumstances, strengthen the fertilising power of the liquid. Which of them, or how many of them, it would be advisable for you to use, depends on the condition of the land. Try a patch of land with 1 cwt. per acre of common salt in the liquid. The burnt earth you speak of may be of use as a top-dressing for Grass, especially if the land be a stiff clay.

Mangold Wurtzel.—*G. P.*—Field-beet is, perhaps, a better name.

Manure.—*A Cheshire Farmer.*—Apply about 2 cwt. of guano, broadcast, over the Wheat-land as soon as it is dry, and harrow or hoe it in.——*J. White.*—Six or eight bushels of bones per acre, previously treated with sulphuric acid. Guano is the best of the new manures: it is generally applied at the rate of 3 cwt. per acre. You should depend for your Corn crop, not upon a special application of manure to it, but upon the fertility of the land consequent upon your manuring and cultivation of the previous green crop.——*Delta.*—Phosphate of ammonia is a powerful but *expensive* manure. With regard to Potatoe-planting—hereafter. We do not know the patent inorganic manures you speak of. It is the interest of the farmer to pay little attention to *patent* manures, and to see to the due economising and preparation of the dung of his own farm-yard. We should be sorry to say, "Don't believe half the statements purporting to be of facts, put forth by the advertisers of their patent manures;" but we may safely say, "Don't admit half the inferences they would have you draw from these statements."

Marl.—*A Subscriber.*—This will not injure dung that it is mixed with. A source of carbonic acid will not volatilise ammonia. Marl does well applied as a top-dressing.

Nitrate of Soda.—*Cler., Lancast.*—Apply it now, in wet weather, 1 to 2 cwt. per acre.

One-horse Carts.—*M. C.*—You can get working drawings from any Scotch implement-maker, and get them made at any English implement maker. We do not advertise tradesmen in our Notices to Correspondents.

Parsnip.—*Leeds.*—Next week.

Road-material.—*V.*—If your clay is calcareous, it will not do to burn for road-material. Further particulars next week.

Rotation of Crops.—*T. Ridge.*—Your plan is a good one. Guano, or Potter's guano, is our best manure. Bone-dust and sulphuric acid might answer on your clay-land. Further particulars next week.

Sparrows.—*A New Subscriber.*—Put a little bird lime, some dry day, about the holes in your roof.

As usual, a host of letters has arrived too late for answers this week.

Markets.

SMITHFIELD, Monday, March 4.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	4s 0	to 4s 4		Best Downs & Half-breds	4s 2	to 4s 6	
Best Short Horns	3 8	4 0		Best Long-wools	3 8	4 2	
Second quality Beasts	3 2	3 6		Ewes and second quality	3 4	3 8	
Calves	4 0	5 0		Pigs	3 4	4 4	

Beasts, 2115; Sheep, 22,610; Calves, 50; Pigs, 368.

The continuous heavy rain we have this day experienced has checked the advance in prices which, doubtless, would otherwise have been realised, in consequence of the very short supply. Notwithstanding the thorough wet day kept away many buyers, yet the unusual shortness of numbers caused a ready sale at rather more money than last week. The best Scots, for the most part, made 4s 4d per 8 lbs., and the best Short-horns from Norfolk, 4s; those from Lincolnshire were few, and of indifferent quality, and cannot be quoted at more than 3s 10d per 8 lbs. The larger Downs and Half-breds have been more in demand, and made fully 2d per 8 lbs more than of late; but the smaller Downs scarcely exceed our former quotations—in some instances, perhaps, 4s 8d has been realised, but 4s 6d is the more general price. Ewes are a heavy sale—so many being in lamb at this time of year, the Butchers are very shy of purchasing them. Veal and Pork remain steady.

Friday, March 8.

We have to-day a very large increase on last week's number of Beasts, owing to the arrival of some Scotch vessels with an extra quantity for Smithfield. We notice, also, a few from Holland, in very good condition. Our Monday's highest quotations can hardly be supported; the best qualities of Beef cannot be quoted at more than 4s 2d per 8 lbs, and other qualities in like proportion. Sheep-trade is brisk, at Monday's prices; there are a few more, but all in demand. Calves and Pigs sold slowly, at late rates.

Beasts, 915; Sheep, 2440; Calves, 160; Pigs, 300.

41, West Smithfield.

ENGLISH TIMBER AND BARK.—March 5, 1844.

Southdown Fleeces	1 0½	1 2			

James Perrin, Wool Broker.

MARK LANE, Friday, March 8.—The arrivals of all descriptions of Corn have been moderate during the week, and the few parcels of English Wheat fresh up for this morning's market realised fully Monday's prices. Business in free Foreign has been very limited, but we observe no alteration in its value; with the exception of a cargo of Polish Odessa from Trieste, sold ex ship at 38*s.* per qr. in Bond, we have not heard of any transactions under lock or f. o. b.—Barley meets a slow sale at our quotations.—Beans and Peas are unaltered in value.—The Oat trade is heavy, and rather lower.

Kingsford and Lay.

COVENT GARDEN, Mar. 8.—The supplies of most articles during the week have been pretty well kept up, and trade begins to get brisk. No alteration has taken place in the prices of Pine Apples since our last report; Grapes are a little advanced in price, they are offered at from 1*s.* to 4*s.* per lb. Large Kitchen Apples are becoming scarce, and are offered at higher prices. Good Dessert Pears are not plentiful; they are selling at from 4*s.* to 12*s.* per bushel. Oranges are sufficient for the demand. Lemons are offered at nearly the same prices as quoted in our last report. Chesnuts are good and plentiful. A few Strawberries are still in the market, but they are only brought in small quantities. The supply of most kinds of Vegetables has been tolerably well kept up. Large White or Cornish Broccoli is selling at from 8*s.* to 12*s.* per dozen heads. Savoys have not been very plentiful during the week. Little variation has taken place in the prices of Brussels Sprouts or Greens, which continue to be pretty abundantly supplied. Carrots and Turnips are good and plentiful. Seakale is a little advanced in price since our last report. French Beans are nearly the same as last week. Asparagus and Rhubarb are good and plentiful. Celery is becoming scarcer. Cucumbers being more plentifully supplied are becoming cheaper; they are offered at from 2*s.* to 4*s.* each. Cut Flowers chiefly consist of Gardenia radicans and florida, Erica Willmoreana, Lechenalia tricolor, Camellias, Scarlet Pelargoniums, Lily of the Valley, Acacias, Azaleas, Heliotropes, Tulips, Jonquils, Cinerarias, Moss, Province and China Roses.

Fruits.

Pine Apple, per lb., 6*s* to 10*s*

Tarragon, Green, per bun. 4*d* to 6*d*
Endive, per score, 1*s* 6*d* to 2*s*
Green Mint, 4*d* to 9*d* per bunch
Marjoram, green, p. doz. bun. 1*s* 6*d* to 2*s*
Chervil, per punnet, 2*d* to 3*d*
Salsafy, per bundle, 1*s* to 1*s* 6*d*
Scorzonera, per bundle, 1*s* to 1*s* 6*d*

POTATOES.—Southwark Waterside, March 4.

There has been considerable firmness in the prices during the past week, and the best samples have gone off readily; other qualities, also, have been in more request. We have had but a limited supply, generally, particularly from the northern districts, owing to a severe snow storm, which has caused a slight advance in the price of the best samples; yet this has been occasioned more by the shortness of the supply, than by any extra demand.

Trade very dull. Joshua Baker, Hay Salesman.

THE CONICAL HOT-WATER BOILERS, invented by J. Rogers, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. Shewen having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney: Messrs. Henderson's, Pine Apple-place; Messrs. Veitch and Son's, Exeter; Mr. Pontey's, Plymouth; the Royal Botanical Society's Gardens, Regent's Park; and at the Gardens of the Horticultural Society of London. Considerable improvements have been effected since last season; particulars of which are in course of preparation.

HORTICULTURAL BUILDING & HEATING by HOT WATER.

J. WEEKS & Co., Architects, &c., Gloucester-place, King's-road, Chelsea, Hothouse-Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry, that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing-houses 300 feet in length.

Their improved plan of BOTTOM-HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the Nobility and Gentlemen's seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

WIRE-WORK, HOT-WATER APPARATUS, GREENHOUSES, &c.

ST. THOMAS BAKER, MANOR-HOUSE, MANOR-PLACE, KING'S-ROAD, CHELSEA, Manufacturer of INVISIBLE WIRE FENCE, to resist Grazing Stock, and rendered Rabbit-proof. WIRE-WORK in Trainers, Arches for Walks, Bordering, Flower-stands, Pheasantries, &c. HORTICULTURAL BUILDINGS, Green and Hothouses, Conservatories, &c. The same heated by HOT-WATER APPARATUS, on improved and economical principles.

Parties waited on in Town or Country, and Drawings and Estimates free. Work for the Trade as usual.

Ward's Cases, or Domestic Greenhouses.

BURBIDGE AND HEALY beg respectfully to inform the Horticultural world that they are quite ready to supply their new BOILER, of every size. They have now fixed a sufficient number to warrant them in stating that what they put forth as the qualities of their Boiler and Furnace arrangement may be perfectly relied upon: they have put up one at the Horticultural Gardens, where B. and H. believe it is considered to answer as represented; they have also fixed it in connection with a new description of Iron Tank, which combines the qualities of the round pipe and the open tank, which may be pronounced the perfection of a Heating Apparatus for Horticultural purposes, particularly for Graperies, Epiphyte-houses, Melon-pits, &c., &c. The arrangement is such that any gentleman or gardener may have the whole constructed so as to be put together with the greatest facility by the gardener, first sending a correct plan to 130, Fleet-street. A Prospectus may be had detailing the prices, &c.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks, which are ornamental in appearance, can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. Mr. Rendle, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. Bailey having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. Bailey also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. Bailey were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. Bailey have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

TO GARDENERS AND AGRICULTURISTS.

SUPER-PHOSPHATE of LIME is capable of producing a more rapid vegetation in Plants than any substance known. It may be had at Mr. Lawes' Factory, Deptford Creek, price 7s. per cwt. Phosphate of Potash, 15s. per cwt.
,, Soda . 12s. ,,
,, Magnesia 9s. ,,
,, Ammonia 1s. per lb.

MANURES FOR WHEAT, &c.

POTTER'S GUANO.—Result of an Experiment on Wheat, tried near Colchester—sown Nov. 1842, reaped August 1843. Potter's Guano.—Seven bushels per acre gave 54¾ bush. Grain. Daniell's Manure, 40 bush. per acre, gave 46 bush. Grain. Difference in favour of Potter's Guano, 8¾ bush.

Note.—The Daniell's Manure cost 3l. Potter's (present price) 2l.—Works 28, Upper Fore-street, Lambeth; sold by M. Fothergill, 40, Upper Thames-street.

BEAUTIFUL FLOWERS. — POTTER'S CONCENTRATED LIQUID GUANO, for Flowers, Kitchen Garden Produce, &c. Sold by appointment, by Savory and Moore, Chemists to the Queen, 136, New Bond-street, and 220, Regent-street, and can be had of most respectable Chemists and Seedsmen. Price 1s. 9d. the quart bottle, with directions.

Dr. Lindley, in the *Gardeners' Chronicle* for 1843, p. 560, says—"Potter's Guano will convert your desert into a paradise." And in the Number, Feb. 10, 1844—"Potter's Guano is unrivalled."—Works, 28, Upper Fore-street, Lambeth.

GENUINE PERUVIAN & BOLIVIAN GUANO
ON SALE, BY THE IMPORTERS,
ANTONY GIBBS AND SONS, LONDON;
GIBBS, BRIGHT, AND CO., LIVERPOOL AND BRISTOL.
47, Lime-st., Mar. 8. 1844.

ON SALE, in any quantity, PERUVIAN and BOLIVIAN GUANO, genuine as imported.—Apply to Cotesworth, Powell, and Pryor, London; Edwards, Danson, and Co., Liverpool; or William J. Myers and Co., Liverpool, the Importers.

GUANO, PERUVIAN, &c.—The above Manures, also Potter's Guano, Nitrates of Soda and Potash, Gypsum, Bone-dust, and all other Chemical Manures of known value may be had of the undersigned, on the best terms, for cash.

Lists of Prices, with Synopsis of mode of use, on applications to Mark Fothergill, 40, Upper Thames-street, and 5, Railway Place, Mark-lane, London.

PERUVIAN GUANO, of first quality, and in any quantity, direct from the Bonded Stores. Also African Guano, and Nitrate of Soda.—Apply to H. Rounthwaite and Co., 6, Cable-street, St. George's Crescent, Liverpool.

CHOICE FLOWERS AND PLANTS IN POTS.

HUMPHREYS'S COMPOUND, applicable to all Greenhouse Plants, to Hyacinths and other Bulbs, and to promote the germination of Seeds. Sold in bottles 1s. 9d. each, by Flanagan and Son, Mansion-house-street; Warner and Warner, Cornhill; Hurst and McMullen, Leadenhall-street; W. Clark, Bishopsgate-within; Smith, Islington Nursery; Grimley and Co., Covent Garden; Batt and Rutley, 412, Strand; William and John Noble, Fleet-street; Smith, Covent Garden; Charlwood, Tavistock-row; W. J. Nutting, 46, Cheapside; G. Lawrence, 18, Piccadilly; John Kernan, Great Russell-street, Covent Garden; Lockhart, 156, Cheapside; Shuttleworth, Pantheon; Minier, Adams, and Nash, 63, Strand; Thatcher and Son, Islington; J. Fryer, Clarendon-terrace, Camberwell; Thomas Ansell, Camden Town; Thomas Watkinson, Market-place, Manchester; T. S. King, Rochester; W. E. Rendle, Plymouth; Dickson and Co., Edinburgh; Pontey, Leeds; Fisher, Holmes, and Co., Sheffield; P. Lawson and Son, Edinburgh; J. Thorne, Shepton Mallet; and other leading Seedsmen in town and country. Wholesale Agents, Davy, Mackmurdo, and Co., 100, Upper Thames-street, London.

THE URATE of the LONDON MANURE COMPANY, 5l. per Ton. It is with the greatest satisfaction, after three years' experience, the Company are enabled to recommend the above as one of the best manures for Barley, Oats, Spring Wheat, and more especially Turnips. By promoting a rapid growth of the latter it secures a full plant, at the same time producing a great weight per acre, and extending its beneficial effects to the succeeding crops. The Urate may be sown broadcast, or which is preferable, by the drill, at the rate of one ton to three acres, and it is desirable it should not be placed more than two inches below the surface. As a top-dressing for Wheat the Urate has been used with great advantage. Gardeners and Florists will find it very useful for Dahlias and other roots. Full particulars and Testimonials will be forwarded on application. Genuine Peruvian Guano; Phosphate and Sulphate of Ammonia; Gypsum and every other artificial Manure.

Edward Purser, Secretary, 40, New Bridge Street.

The New Manure.

HUMPHREYS'S FARMERS' COMPOUND, presenting superior advantages to any Manure yet offered to the Public. It is rich in the Phosphates, Silicates, and Nitrogen, with certain new agents, so as to prove most economical and effective for Wheat, Barley, Pulse, Potatoes, Meadow Land, &c. Being manufactured on a new principle, this Manure *will not wash out of the soil* like Guano or the Salts, but with the mild and lasting qualities of the "Home-made" combines the most energetic fertilising chemical agents; adapted to all the purposes of Husbandry and Garden Culture, and unrivalled as a Top-dressing for all Spring Crops. Quantities per acre, according to the condition of the land:—For Wheat, from 2 to 5 cwt.; Grass, Clover, &c., from 1 to 4 cwt.; Turnips, from 2 to 4 cwt.; Hops, from 4 to 6 cwt. 12s. per cwt.—Wholesale Agents, Davy, Mackmurdo, & Co., 100, Upper Thames-street, London.

GLASS SUPERSEDED for HORTICULTURAL PURPOSES by WHITNEY'S CHEMICAL TRANSPARENT WATERPROOF COMPOSITION, rendering Muslin, Calico, or Linen, for the Frames of Greenhouses, Pine, Melon, or Cucumber Stoves, &c., impervious to rain or moisture, admitting light equal to Glass, much warmer, and the plants never burn under it.

Noblemen, Gentlemen, and Gardeners will, by using this composition, have the only effectual protection for their Fruit-trees during the blooming season; it is a certain defence from frost, sleet, wind, and blight; its transparency admits the general beams of the sun, with abundance of light, which causes the bloom to expand with increased luxuriance, the fruit to set and swell more freely, much earlier, and a crop of fruit to any extent may be warranted. The covering not to be moved by day (except to thin the Fruit, which will be necessary), till the month of June. It is recommended that the Calico be prepared early, so as to be thoroughly dry before using.

Sold in Bottles, with directions for use, pints, 2s. 6d., quarts, 4s. 6d. each. One pint is sufficient to coat four Frames twice over, each Frame to be 5ft. by 3 ft. 3 in., or thereabouts. Prepared by George Whitney, Chemist, Shrewsbury. Seedsmen, Florists, and Merchants supplied by Mr. W. Bailey, Chemist, North-street, Wolverhampton. Appointed Agents:—Messrs. Butler and Muckley, Covent Garden, where a sample of prepared calico may be seen; Mr. Watkinson, Market-place, Manchester; Page and Son, Southampton; T. and C. Whalley, Nurserymen, Liverpool.

Agents wanted for London and the country.

ASPHALTUM in its pure state, with all the material and instruction how to prepare, or if required, the labour performed at a moderate charge.—Apply to J. A. Hubbard and Son, 20, Harp-lane, Tower-street. All Letters prepaid.

KEENE'S PATENT MARBLE CEMENT.—This CEMENT is particularly adapted for the Walls and Floors of Conservatories and Greenhouses, being calculated, from its extreme hardness, to resist the wear incident to ordinary Plastering. For Floors it has a threefold advantage over Stone-paving: 1st, in its lightness; one inch in thickness of Keene's Cement sufficing where 2 to 3 inch flagging would be employed. Next, in its appearance, combining as it does the hardness of stone with an uniform colour and even surface free from joints; and lastly, in economy, being one-third the price of Portland paving.

The most conclusive evidence can be given of the utility of Keene's Cement for these purposes by the Patentees and Manufacturers.—John Bazley White & Sons, Millbank-st., Westminster.

TO AGRICULTURISTS.

THE Dry Material for making CAMPBELL'S CORN-PRODUCING LIQUIDS, or FERTILISING STEEPS, which have arrested the attention of Agriculturists in all parts of the United Kingdom, is now to be had in Boxes containing quantities for 5 Gallons and upwards, at the following prices, viz.:—

For Wheat, Material per Gallon ....2s. 6d.
,, Oats and Grasses, ...1 6
,, Barley, ...2 0
,, Beans and Pease, ...2 0
,, Turnips and Rape Seed 2 6

Agents in London:—Mr. Edward Purser, 40, New Bridge-st.; Messrs. Geo. Gibbs and Co., 26, Down-st., Piccadilly; and Messrs. Thomas Gibbs and Co., Corner of Half-moon-street, Piccadilly.

SUPERIOR SUBSTITUTE FOR TARPAULIN, &c.

C. MACINTOSH & Co., having made a considerable reduction in the price of the Patent India Rubber Covers for Carts, Waggons, Ricks, &c., beg to call the attention of Users of Tarpaulin and Oiled Sheets to the superiority of their manufacture as an effectual protection against wet, not liable to crack on being folded, and more economical than any other Waterproof Cover.—22, York-street, Manchester; and 46, Cheapside, London.

GREAT ECONOMY.—Much time and a great deal of labour will be saved by the use of the SUSSEX CHURN. Attwood, Wimble, and Warner, Manufacturers, Lewes. This Churn being made entirely of block tin, the necessary degree of temperature can be given to the cream, by placing it in a pan of cold or hot water, which ensures the butter coming in 10 or 12 minutes at all seasons of the year. The simplicity of its construction, and the facility with which it may be cleaned, are no inconsiderable advantages over those now in common use.

Sizes.	Nos. 00.	0.	1.	2.	3.
Churn	2½ lbs.	4 lbs.	7 lbs.	14 lbs.	28 lbs. of butter.
Price with pans complete,	18s.	20s.	25s.	33s.	40s.

Delivered, carriage paid, to any part of London.

London Agents.—Benham, 19, Wigmore-street, Cavendish-square; Livermore, 30, Oxford-street; Baily, 71, Gracechurch-street; Wright's Range Warehouse, near the Monument.

Export Agent.—Barnes & Co., 109, Fenchurch-street.

N.B.—To be seen at the Polytechnic, and Adelaide Gallery.

Observe.—The Improved Water Pail, 4s. and 5s. each.

A SINGLE BOTTLE OF BETTS'S PATENT BRANDY may now be obtained in a perfectly genuine state. This convenient arrangement for both vendor and purchaser, and their mutual security against deception, is effected by the use of Betts's Patent Metallic Capsule, made of pure and Solid Metal, (not Tin Foil) which completely encloses the cork and mouth of the bottle, and is embossed with the words "Betts's Patent Brandy, 7, Smithfield Bars," the *fac-simile* of which is engraved on a label affixed to each bottle.

In the present day it is impossible to produce anything new and useful without exciting the cupidity of imitators. Already attempts are made to mystify the identity of the original and genuine article, by foisting upon the public the contents of bottles having a Tin Foil covering, falsely denominated "a neat metallic capsule." J. T. BETTS & Co. therefore deem it essential to impress upon purchasers the absolute necessity of comparing the embossed Capsules with the Labels, as an infallible mode of detecting fraudulent substitutions.

Betts's Patent Brandy, thus protected, may be obtained of the undermentioned Wine and Spirit Merchants, at 3s. 6d. per Bottle, Bottles included; or at 18s. per Gallon, as heretofore, at

Bishopsgate Street	W. Stevens, Nos. 78 and 80.
Bayswater	Charles Simpson, 22, Bayswater Terrace.

GARNER'S STAFFORDSHIRE.—Just Published,

THE NATURAL HISTORY, ANTIQUITIES, MANUFACTURES, &c., of the County of Stafford. By Robert Garner, F.L.S., 8vo., with many Illustrations. Price One Guinea. John Van Voorst, 1, Paternoster-row.

In fcap. 8vo., with Illustrative Diagrams, price 9s.,

ANATOMICAL MANIPULATION: or, the Method of Pursuing Practical Investigations in Comparative Anatomy and Physiology. Also an Introduction to the Use of the Microscope, &c., and an Appendix. By Alfred Tulk, M.R.C.S. M.E.S., and Arthur Henfrey, A.L.S. M.Mic.S.

John Van Voorst, 1, Paternoster-row.

BEE-HIVE.—THE BAR AND FRAME-HIVE.

Early in April will be published, by Mr. John Van Voorst, of Paternoster-row, in the form of a pamphlet, for the convenience of transmission through the Post-office,

A DESCRIPTION of the BAR and FRAME BEE-HIVE, invented by W. A. Munn, Esq., with some short Directions for the Management of an Apiary.

A Bar and Frame-Hive may be seen at Mr. John Milton's, No. 10, Great Marylebone-street, London.

SECOND EDITION.

MILLS'S TREATISE ON THE CULTURE OF THE CUCUMBER, MELON, SEA KALE, AND ASPARAGUS. Published by William Smith, 113, Fleet-street.

The truth of Dr. Lindley's statement in his review of the above work was strictly verified at the late Great Exhibition of Cucumbers at Ipswich, viz., "Any person having Mills's book, whether a gardener or not, can grow Cucumbers."

By the report of the above exhibition in the *Gardeners' Chronicle*, the first prize was won by an amateur, Edward Leathes, Esq., on Mills's system.

LIEBIG'S AGRICULTURAL CHEMISTRY.

PORTRAIT of PROFESSOR LIEBIG. 7*s.* 6*d.*

Printed for Taylor and Walton, 28, Upper Gower-street.

THE LANCET, greatly Enlarged, and the price changed from Eightpence to SIXPENCE. *Stamped* for free postage.

Mr. WAKLEY, Surgeon, M.P., Editor;
HENRY BENNET, M.D., Sub-Editor.

LIEBIG (Giessen).—Lectures on Chemistry. Applicable to Animal and Vegetable Physiology, Health, Diet, Disease, Agriculture.

LISTON (London).—Lectures on all the Operations of Surgery.

SCHONLEIN (Berlin).—Lectures on Clinical Medicine.

BAILLARGER (Paris).—Lectures on Diseases of the Brain and Insanity.

At the conclusion of the current volume of The Lancet, 16th March, 1844, that Journal will be permanently enlarged more than one-third beyond its present size; and *Stamped* for universal delivery by *Post*. The future price of the journal will be *sixpence*, instead of *eightpence* the Number, thus at the same time *adding* to the *size* of the Work *more than a third*, and *reducing the charge one-fourth*,—events, probably, which are unprecedented in the history of successful periodical literature. Nothing but the now certain enormous increase of the sale and circulation of the Work, could justify the presentation of these advantages to its readers.

THE ENLARGED LANCET

will commence with the celebrated Lectures on Chemistry, as that science is applicable to Medicine, Animal and Vegetable Physiology, Diet, Health, the Cure of Disease, and scientific Agriculture, delivered at Giessen, by the renowned Professor Liebig. These invaluable Lectures have been expressly composed for publication in England, and are furnished to The Lancet by Professor Liebig himself.

A complete course of Lectures on all the Operations of Surgery, delivered by the distinguished Professor Liston, who, as an operative surgeon, stands without an equal in Europe.

A course of Lectures on Clinical Medicine, delivered at the Great Charity Hospital, Berlin, by Professor Schönlein, first Physician to the King of Prussia.

A course of Lectures on those Diseases of the Brain which produce Insanity, delivered in Paris by M. Baillarger, Physician to the gigantic Hopital de la Salpetriere, an Institution which contains 1500 insane persons. These Lectures will embrace the whole subject of Mental Diseases.

In addition to the above Lectures, some of which, in point of value, will be unsurpassed by productions of a like character in any language, the greatly enlarged size of the Lancet will furnish it with space for containing,—Original Communications;—ample Reviews of Medical Works; Reports of Discussions in Medical Societies; Critical Analyses of the original Communications published in the other British Medical Journals, Analyses, and Reports of Papers devoted to Chemistry and Pharmacy;—Translations from the Foreign Journals. Reports of the most interesting Cases and Operations in all the great Hospitals of London.

Reports of all Public Meetings of the Profession, and of the Speeches on Medical Law, delivered in Parliament;—all the general Medical Regulations of the Poor-law Unions;—Army and Navy Medical Intelligence;—Medical Biographies; and Medical News of every description, occurring in all parts of the civilised world.

The Lancet, which has long maintained the largest sale and circulation of any medical journal in the kingdom, will now be printed in a form to admit of its general transmission by post, at the cost of a penny Stamp. Mr. Churchill earnestly hopes that orders for the Work, distinctly specifying the *stamped* or the *unstamped* Numbers, will be given to Booksellers or Newsmen without delay.

London: The Lancet-office, 46, Prince's-st., Leicester-square.

THE IRISH FARMERS' GAZETTE and HORTICULTURAL JOURNAL. Edited by Edmund Murphy, A.B, T.C.D., Landscape Gardener and Improver of Estates, &c.

This Paper was commenced in May, 1842, and having been adapted to the circumstances of Irish Farming—now in a transition-state from the worst to an excellent system—not only points out the best practice, but, giving plain instructions how every operation should be performed, is now recognised as the ORGAN of AGRICULTURAL IMPROVEMENT in IRELAND, where the advantages which have already resulted from it are universally recognised. The result of practices recommended, and of experiments on all subjects connected with the improvement of land, and the increase of its produce, are freely communicated to the Editor and recorded. Selections of the most practically useful articles are made from the various works on farming with which the press now teems, and utterly eschewing politics—so long the bane of the Irish Farmer—and devoting its columns exclusively to Agricultural and Horticultural improvement.

THE FARMERS' GAZETTE has the distinguished honour to be stamped with the approbation of those eminent individuals, Wm. Blacker, Esq., James Smith, Esq., of Deanston, and the late Mr. Loudon, and is received with such confidence that the practice of having its contents read at stated periods to assembled farmers is becoming general. The circulation of the IRISH FARMERS' GAZETTE has of late been extending even in England and Scotland, where, up to this period, no effort has been made to bring it under notice, but where the principles of good husbandry being everywhere the same, it is calculated to be equally useful as it has been found to be in Ireland. The most practically useful essays on Farming are, from time to time, struck off for distribution in the shape of TRACTS FOR FARMERS, and have been very extensively circulated, viz.:—On the Dairy—A Catechism of Thorough Draining and Subsoiling—The Culture of Flax—Management of Manure and Green-Cropping and House-Feeding, are nearly ready. Also, on the 1st Jan. was published, the "Irish Farmers', Gardeners', and Foresters' Almanac."

THE IRISH FARMERS' GAZETTE is published every Friday, at 22, Bachelor's Walk, Dublin, and goes free by post. Annual subscription, 16*s.*, half-yearly, 8*s.*, payable in advance; and orders directed to the publisher are immediately attended to.

THE LATE Mr. LOUDON.—The following Subscribers to the Works of the late Mr. Loudon have been obtained since making up the List which appeared in the *Gardeners' Chronicle* of Saturday last:—

ARBORETUM BRITANNICUM.—10*l.*

Robt. Vyner, Esq., 19, Hanover Square
J. H. Flooks, Esq., The Mount, Wilton
John Field, Esq., Jun., West Brixton
The Rev. J. C. Clark, F.H.S., Cowley House, Chertsey

ENCYCLOPÆDIA OF TREES AND SHRUBS.—50*s.*

Mr. Cunningham, Liverpool
Mr. W. H. Baxter, Oxford, a second copy
G. Thomson, Esq., Baldon, Oxon.
Messrs. Rollisson and Sons, Tooting
Wm. F. Tighe, Esq., Woodstock-park, Innistiogue, Ireland
Mr. Kerr, Willersley Castle, near Matlock
Mr. John Bell, Nurseryman, Norwich
John A. Beaumont, Esq., West Hill, Wandsworth
Mr. Wm. Young, Milford Nursery, Godalming
Wm. Deedes, Esq., Sandling-park, Hythe

THE SUBURBAN GARDENER.—1*l.*

Wm. Ilfod, Esq., 33, Manchester-street, Manchester-sq.

AUSTRALASIAN COLONIAL and GENERAL LIFE ASSURANCE and ANNUITY COMPANY, 126, Bishopsgate-street, Corner of Cornhill.

Capital £200,000, in 2000 Shares.—DIRECTORS:—

E. Barnard, Esq., F.R.S. | Gideon Colquhoun, Esq.
Robert Brooks, Esq. | C. E. Mangles, Esq.
Henry Buckle, Esq. | Richard Onslow, Esq.
John Henry Capper, Esq. | William Walker, Esq.

BANKERS.—Union Bank of London.

COLONIAL BANKERS.—The Bank of Australasia (incorporated by Royal Charter, 1835), No. 2, Moorgate-street.

PHYSICIAN.—Patrick Fraser, Esq., M.D., No. 62, Guildford-st.

SECRETARY.—Edward Ryley, Esq.

ASSURANCES may be effected with this Company at unusually favourable rates, affording every variety of accommodation to the Assured. Participation in Profits, ascending and descending scales of premium, permission to retain one-third of the premium, which is charged as a debt against the policy, tables for the assurance of a sum payable in the event of death to the executors of the Assured, or to himself upon the attainment of the ages of 45, 50, or 60.

To EMIGRANTS to the AUSTRALASIAN COLONIES assured for the whole life, this Company offers the advantages of permission to proceed to, to reside in, and to return from those colonies without extra premium, and to pay their premiums there.

All questions relating to Assurance and Annuities, addressed to the Secretary, will receive immediate attention.

ARGUS LIFE ASSURANCE COMPANY, 39, Throgmorton-street, Bank.

Empowered by special Act of Parliament, 5 & 6 W. IV., c. 76.

Thomas Camplin, Esq. | Jeremiah Pilcher, Esq.
James Clift, Esq. | Lewis Pocock, Esq.

Physician—Dr. Jeafferson, 2, Finsbury-square.
Surgeon—W. Coulson, Esq., 2, Frederick's place, Old Jewry.
Consulting Actuary—Professor Hall, of King's College.

Advantages of the Argus Life Assurance Company.

Low Rates of Premiums.

In addition to the subscribed capital of 300,000*l.*, the Assured have the security of the Company's Income of nearly 60,000*l.* per annum, yearly increasing, and accumulating Assurance Fund invested in Government and other available Securities, of considerably larger amount than the estimated liabilities of the Company. The Rates of Premium are reduced to the lowest scale compatible with the safety of the Assured and the stability of the Company, thereby in effect, giving to every Policy-holder an immediate and certain bonus without risk, in lieu of the deferred and frequently delusive prospect of a periodical division of profits.

Annual Premium to assure £100.

Age.	For One Year.	For Seven Years.	Whole Term.
20	£0 17 8	£0 16 1	£1 11 10
30	1 1 8	1 2 7	2 0 7
40	1 5 0	1 6 9	2 14 10
50	1 14 1	1 19 10	4 0 11
60	3 2 4	3 17 0	6 0 10

One-third of whole-term Premiums may remain unpaid at 5 per cent. comp. int. as a debt upon the Policy for life, or may be paid off at any time without notice.

In Assurances for advances of money as security for debts, or as a provision for a family, when the least present outlay is desirable, the varied and comprehensive Tables of the Argus office will be found to be particularly favourable to the Assured.

A Board of Directors, with the Medical Officers, attend daily, at a quarter before 2 o'clock.

EDWARD BATES, Resident Director.

A Liberal Commission to Solicitors and Agents.

MUTUAL LIFE ASSURANCE SOCIETY, No. 37, Old Jewry, London.—Established 1834.

TRUSTEES.

John Clarke, Esq. | Phillip C. Moore, Esq.
Richard Groom, Esq. | Henry Thomas Windsor, Esq.

ACTUARY: Peter Hardy, Esq., F.R.S.

Extract from the Report of the Directors of the Society, to a General Meeting of the Members, holden the 17th January, 1844:

"At the end of the six years which have been completed since the 31st of December, 1837, there are in existence in the Society three times as many policies as there were in existence at the end of the year 1837. The capital sums assured under these policies are nearly doubled in amount. The corresponding income derived from annual premiums is also nearly doubled. The accumulated property of the Society is four times as great as it was at the end of that year, and the present divisible surplus is nearly six times as much as that declared in the division of the year 1837."

The Directors invite the public to compare the following Table of the Additions made to the Ten oldest existing Policies in the Society, up to the 31st of December, 1843, with the additions made by other Societies within the same time:—

1834, Policy No.	Sum Assured.	Premium.	Age at Admission	Total Addition made in 1842.	Increase, 1843.	Total Addition made in 1843.	Amount of Premiums paid.	The total addition is equivalent to the following per centage on the amount of premiums paid.
	£	£ s. d.		£ s. d.	£ s. d.	£ s. d.	£ s. d.	
1	1000	24 0 0	29	146 12 0	24 4 0	170 16 0	280 0 0	61

H. H. Cannan, Esq. | Robert E. Alison, Esq.

Medical Adviser—Marshall Hall, M.D., F.R.SS., L. and E.
Secretary—John Emerson, Esq.
Solicitors—Messrs. Palmer, France, and Palmer.

This is the only Company who are bound by their deed of constitution not to dispute any policy unless they can prove it was obtained by fraudulent misrepresentations, the great aim and object of the Society having been to render life policies complete securities and negotiable documents, which shall owe their value to the certainty of the contracts upon which they are founded, and be independent of the liberality or caprice of those in the management of the affairs of the Company when the claims arise; and for this purpose the Company have, by a clause in their deed of constitution, unhesitatingly deprived themselves of the power of objecting to any policy, unless they undertake to prove that it was obtained from them by fraudulent misrepresentation. The regulations common to all other life companies, which make the validity of assurance contracts dependent upon the perfect correctness of the many statements required from a proposer for a life policy, and which have given rise to almost all the questions argued in the courts, and to many extra-judicial compromises, are thus entirely abrogated; and nothing but fraud, proved to have been committed against them, can vitiate a policy granted by this Company.

This is the only Company from whom the assured, on the mutual principle, receive the whole of the mutual accumulations, and also a guarantee from the shareholders for the sums assured.

This is the only Company who bind themselves to pay the full amount of the sums contracted for by the policies, although the debts for which they were effected shall have been liquidated before the claims arise; the Company considering it only reasonable and just towards the assured that where premiums have been received for assuring a given amount, that amount should be paid when it becomes due without dispute or deduction, and they undertake to do so without reference to the state of the accounting between the assured and his debtor.

This is almost the only Company who grant in favour of creditors whole world policies, whereby the debt is secured, although the debtor should go beyond the limits of Europe.

The premiums, calculated according to the Carlisle Tables, are lower than usual upon young lives; and assurances for short periods may, at the option of the assured, be continued for life.

Triennial Ascending Scale to assure £100.

Age	First 3 Years	Second 3 Years.	Third 3 Years.	Fourth 3 Years.	Remainder of Life.
25	£1 2 7	£1 9 9	£1 16 11	£2 4 1	3 11 3
35	1 9 9	1 19 6	2 9 3	2 19 0	3 8 9
45	2 1 0	2 14 10	3 8 8	4 2 6	4 16 4
55	3 11 1	4 10 9	5 10 5	6 10 1	7 9 9
60	4 8 11	5 17 4	7 5 9	8 14 2	10 2 7

By the half-premium plan only one-half of the first seven years premium is required, the other half being payable at the convenience of the assured, thus allowing a policy to be continued for seven years at one-half of the usual rates, or to be dropped at one-half of the usual sacrifice, and entitling the assured, seven years hence, when the loss of health may prevent him from effecting a new assurance, to continue a policy at a rate of premium applicable to an age seven years younger. The half-premium plan therefore enables persons to retain to their own use the one-half of the premiums for the first seven years, at 5*l.* per cent. interest. Thus, suppose the ordinary premium for an assurance of 500*l.* to be 10*l.*, the first payment by the half-premium plan will be five guineas, being the one-half the 10*l.*, and interest of the retained half, and if death should occur in the first year the sum of 500*l.* would be paid less the 5*l.* retained. The assured may thus have the use for the first year of 5*l.*, for the second, 10*l.*, and so on till the end of the seventh year, when the retained sums, amounting to 35*l.*, may either be paid or still retained at 5*l.* per cent. interest until death, when the 35*l.* will be subtracted from the 500*l.* then payable by the Company.

To assure 100*l.* on Half-Premium System.

Age	£ s. d.	Age	£ s. d.	Age	£ s. d.
15 ..	0 16 1	50 ..	1 3 5	50 ..	2 3 9
20 ..	0 18 1	55 ..	1 11 6	55 ..	2 12 5
25 ..	1 0 7	60 ..	1 16 6	60 ..	3 10 3

Prospectuses and schedules are forwarded to applicants, free of expense, by the Manager and Agents.

ALEX. ROBERTSON, Manager.

NEW DISSOLVING VIEWS, DIVER, and DIVING BELL. Among the recent Deposits is the HEAD of a MUMMY from THEBES, very remarkable.—Admission, One Shilling. Schools, Half-price.

News of the Week.

BY the Overland Mail from India, we have accounts of two severe and decisive battles fought by our troops in the vicinity of the capital of Gwalior, on the 28th and 29th of December. One division of our force was 14,000 strong, of which 3000 were cavalry, with 40 pieces of artillery. The enemy mustered 18,000 foot, 3000 cavalry, and 100 guns. The second division comprised only 7000 men and 18 guns, against a force of 12,000 men with 30 guns. Our troops obtained in both battles a signal victory, capturing the fort of Gwalior,—a position so strong as to be called the Gibraltar of the East,—and reducing the powerful Mahratta chiefs to submission. The loss, however, was unusually severe; no less than 180 on our side having been killed, including General Churchill, and eight other officers, with 866 wounded. The loss of the enemy is estimated at upwards of 3000 killed, and twice as many wounded. The accounts state that so desperate a resistance has seldom been recorded in Indian warfare, as that made by the troops of Gwalior, who were officered and led by Europeans. The Governor-General was in the field with Lady Gough and the wives of many of our officers when the battle commenced, and were often exposed to great danger. The object of these hostilities appears to have been gained by the defeat of the chiefs, as our army is at once to evacuate the country and retire within the Company's territories. The news from other parts of India is not of great importance, and from China we have merely the announcement that the supplementary treaty has been ratified and sent to England.—From France we have the details of the great debate on the seizure of Otaheite. The resolution of Ministers to disavow the act of Admiral Dupetit Thouars, and restore Queen Pomaré to her sovereignty was made a trial of strength between the Government and the Opposition, and the result was a majority of 46 for Ministers—a much larger number than they had themselves anticipated. The details of this debate are unusually interesting to English readers, as the main charge against the Government was founded on their alleged compliance with the demands of our own Ministry. M. Guizot, however, confirmed the statement of Lord Aberdeen last week, and distinctly declared that the decision of his Cabinet was adopted solely on principles of international justice, and that no communication whatever had been received from the English Government on the subject.

At home, in the House of Commons, the navy and army estimates have been among the chief subjects of discussion. On Monday Mr. S. Crawford made another attempt to stop the supplies, but his motion found only eight supporters, and the different items of the estimates were voted by large majorities. On Tuesday Mr. Williams brought forward a motion to prevent the sittings of the House after midnight, but on a division it was negatived by 146 to 16. On Thursday Mr. Labouchere brought forward a resolution for the admission of Brazilian sugar, which was opposed by Ministers, and negatived by a majority of 73. Last night the Chancellor of the Exchequer brought forward his long expected measure for the reduction of the Three and Half per Cents. The plan he proposes is to reduce this Stock to 3¼ until Oct. 1854, and to 3 per cent. to Oct. 1874, being a period of 20 years, during which he considers that the reduction will be effected in a gradual and equitable manner.

Home News.

COURT.—Her Majesty and Prince Albert, accompanied by the Prince of Wales, the Princess Royal, and the Princess Alice, arrived in town on Saturday from Windsor Castle, and still continue at Buckingham Palace. On Sunday her Majesty and Prince Albert, the royal suite, and the household, attended divine service in the private chapel of the Palace. The Hon. and Rev. C. Leslie Courtenay officiated. On Monday the Queen held a Privy Council which was attended by nearly all the Ministers and great officers of State. Her Majesty has taken her daily walk in the Palace garden during the week, and the Prince has taken exercise on horseback. Colonel the Hon. Charles Grey has succeeded Lord Charles Wellesley (clerk marshal) as equerry in waiting on her Majesty, and Major-Gen. Sir E. Bowater has succeeded Col. Wylde as equerry in waiting on Prince Albert. Lord Byron and Adm. Sir R. Otway are in residence as the Lord and Groom in waiting.—The daily papers state that her Majesty contemplates during the ensuing season a prolonged residence in the Isle of Wight. Negotiations have been for some time in progress to secure for her Majesty's use an appropriate

residence upon the coast, at a state that it might afford the means of rapid communication by railway with the metropolis, and at the same time possess those facilities for yachting and aquatic amusements in which Brighton is deficient. Within the last few days it is said Osborne House, near Cowes, the seat of Lady Isabella Blachford, has been selected for her Majesty; and should it be found sufficiently commodious, it will probably be taken at first only for a limited period, but with the right to purchase at a fixed price at the expiration of the term. It is hinted that in this case a bill will be brought forward in Parliament, to enable the Crown to dispose of the Brighton Pavilion. H.R.H. the Duchess of Kent, attended by Lady F. Howard, left Frogmore Lodge on Saturday, on a visit to the Queen Dowager, at Witley Court.

The Levees.—Notice has been issued from the Lord Chamberlain's Office, that her Majesty will hold levees at St. James's Palace, at two o'clock on Wednesday, the 13th inst.; and on Wednesday, the 20th inst, and a Drawing-room at the same hour on Monday the 25th inst.

Consular Appointments.—The Queen has been pleased to appoint H. R. Plaw, Esq., now Consul at Dantzig, to be Consul-General in Prussia, to reside at Dantzig. F. C. Macgregor, Esq., to be Consul at Canton; G. Balfour, Esq., to be Consul at Shanghai; R. Thom, Esq., to be Consul at Ningpo; H. G. Kuper, Esq., to be Consul at Elsinore; and H. C. Rawlinson, Esq., Consul at Bagdad.

New Sheriff.—At the Privy Council on Monday, her Majesty was pleased to appoint Charles Grantham, of Ketton, Esq., to be Sheriff of the county of Rutland for the year ensuing.

The Navy.—It is stated that Rear-Admiral Sir Geo. Seymour, Bart., one of the Lords of the Admiralty, will succeed Rear-Admiral Thomas as Commander-in-Chief in the Pacific. It is said the Admiral will hoist his flag in a line-of-battle ship, and not a frigate, and that it will be either the Albion or Rodney.

Freemasonry.—The Earl of Zetland was on Wednesday elected Grand Master of the Freemasons for the year ensuing. The Marquess of Salisbury was also put in nomination.

Foreign.

FRANCE.—The important debate on the seizure of Otaheite took place on Thursday. A large number of Deputies were present, and the galleries, public and private, were crowded, the halls and passages being also thronged with persons applying for admittance. M. Thiers, who had not attended the last sittings, was observed to be keeping up very animated conversations with MM. Barrot, De Remuzat, Billault, and other leading men of the Opposition. The sitting commenced by the Minister of Public Works, who presented three Bills relative to the railroads from Paris to Belgium, from Orleans to Vierzon, and from Nismes to Montpellier. M. de Carne then rose to put his questions relative to the Otaheite affair. After much declamation, and reminding the Chamber of the humiliation inflicted on that flag which, "in the presence of the English guns, the Vengeur nailed to her masts," he demanded explanations as to the nature of the provocation given to Admiral Dupetit Thouars, the presence or absence of the said flag, and wished to know whether the disavowal of the Admiral were an act of clemency or justice.—M. Guizot replied that if he followed his inclination he would apply the epithet opprobious to the imputations which it had been sought to cast upon the Government respecting this affair. He would abstain from it, in order not to inflame the discussion and at once enter into that discussion. He then read the treaty of the 9th September, 1842, and the Government instructions to Admiral Dupetit Thouars and Captain Bruat, who are continually urged in them to act in concert with Queen Pomaré and to preserve the best understanding with her. "France," exclaimed the Minister, "wished honestly and frankly for the execution of the protectorate and wanted nothing beyond that; no instructions to a contrary effect have been issued to our naval officers." He acknowledged that certain things had been done at Otaheite by the influence of the English missionaries which he would not extenuate. Yet, when the French Admiral arrived before Otaheite, the French agents placed near the Queen had not ceased to exercise their functions. Moreover at that very period the officers of the English navy received from their Government orders not to disturb the protectorate of France. The Queen executed the treaty more or less willingly, but still she executed it; the English officers declared that their Government acknowledged the right of France and the protectorate flag had never ceased to float, and the Queen had a right to add to it any other flag she pleased. It was a right of sovereignty contrary to no international law. The Minister next read the correspondence of Admiral Dupetit Thouars with Queen Pomaré, and concluded from it that the former was not justified in considering the raising of a peculiar flag an act of rebellion and an offence to France. Yet it was on this plea that he had deposed her. M. Guizot read Queen Pomaré's letter to Louis-Philippe and said that it had been received through the medium of the Admiral—that it was written in the language of the country—and that he therefore considered it an authentic document which foreign influence had not dictated. "Such," said M. Guizot, "are the facts of this case, and the Government has disapproved of the Admiral's conduct, because there was nothing in his instructions to authorise the course he has pursued. We have declared that we shall confine ourselves to the mere execution of the treaty of 1842. We think that there is no advantage in changing the protectorate into a sovereignty; such has always been our opinion, and above all that of the Opposition in this Chamber." He then indignantly repelled the accusation of the French Government having acted on this occasion in compliance with the pleasure of the British Government, and he asserted that the course adopted towards Otaheite had been resolved on before any communication from the English Cabinet. M. Guizot concluded by asserting the independence which he and his colleagues had ever displayed in all questions discussed with England, and said—"We shall endeavour to keep up a good understanding with her; we shall favour a mutual friendly intercourse; but never shall we make to her any concession contrary to France."—M. Billault then mounted the tribune and made a violent attack upon the Government, accusing the Cabinet of having yielded to fear of the cannon of England. He denied that it was a mere quarrel about a flag; the quarrel was one of sovereignty, and was not with Queen Pomaré, but with Great Britain, and he complained that the Cabinet had not called upon the English Government for some explanation relative to the conduct of Mr. Pritchard.—This speech, which created a great sensation in the Chamber, was followed up by M. Dufaure, who said that Admiral Dupetit Thouars had acted as a man of honour and patriotism in the whole affair. The protectorate flag was pulled down, and it was when he sought and was refused reparation for that insult that he took possession of the island. He thought it dangerous to disavow lightly the acts done by the Navy when acting at such a distance that it is impossible to give them minute instructions. The disavowal of the acts of Admiral Dupetit Thouars would be a great discouragement to all officers acting in distant latitudes, and their authority would be weakened by it. He thought the conduct of the Government unjustifiable, and declared that he would rather see the French navy given up altogether, to finding it suffering such acts as the Government were then justifying.—The Minister of Public Instruction replied, and entered into a warm defence of the conduct of the Ministry, but was listened to with great impatience by the Chambers.—The President then announced that M. Ducos had placed a motion in his hand, for the purpose of terminating the debate, to the effect that "the Chamber, without approving of the conduct of the Cabinet, pass to the order of the day." Upon this question the Chamber was about to divide, when M. Guizot rose and proposed an adjournment, in order to give the house an opportunity of discussing the question fully. This was violently objected to by the Opposition; but after a scene of some confusion, the President pronounced for M. Guizot's motion, and the debate was adjourned.—On Friday M. Guizot again adverted to the facts of the case, and adduced proof that the decision of the Government was not influenced by the intervention of England. His speech was very short, but the effect of it was to rally a portion of the usual supporters of Government, who at the commencement of the sitting are said to have wavered as to the part they should take.—M. Thiers followed, and insisted that the House was not in possession of sufficient facts to judge of the conduct of Admiral Dupetit Thouars. If the Government had any further despatches it did not communicate them to the Chambers; if it had not further despatches, the Government could not judge of the Admiral's conduct; and in either case the Chambers were not in a position to form an opinion on the subject. He warned the Chambers of the danger of disavowing the acts of officers acting at a great distance, and cited cases to show that the policy of Governments was always to be careful to support the acts of their officers.—The Chamber then came to a division on the motion of M. Ducos, "That the Chamber pass to the order of the day without approving of the conduct of Ministers." The scrutiny having been demanded, the Chamber voted by ballot, when it appeared that there were—for the motion, 187; against it, 233; majority for Ministers, 46. This result is said to be much more favourable than the Government expected, and the majority included all the Legitimist members who were supposed likely to vote with the Opposition on account of the late debate on the Address.—On Saturday the petitions against the fortifications came under discussion, and Ministers were attacked for the unlawful extension given to the works. M. Chabaud-Latour, General Paixhans, and Marshal Soult defended the conduct of the Government, Marshal Soult entering into long details to show that as far as the executive was concerned, the law of 1841 had been strictly adhered to. The debate was adjourned to Saturday in order to give M. Arago and M. Allard an opportunity of speaking.—On Monday, the Minister of the Interior presented the Secret Service Money Bill. The sum demanded is the same as that of last year, namely, one million of francs. The bill was to be examined in the bureaux on Tuesday, and the time when the public debate on the subject would come on would depend upon the success of the Opposition in the bureaux. The Opposition were to make a strong effort to annoy the Cabinet on the question, but after the result of the division on the Otaheite affair, there is now no doubt that the Ministry will triumph. It is even said that M. Dufaure and his friends, whom M. Thiers announced as his adherents, and all of whom voted for the proposition of M. Ducos, will support the Ministry on this occasion.—The *Messager* of Monday officially announces the re-election of the five Royalist deputies who resigned their seats in consequence of the offensive language inserted against them in the address. M. Berryer had 355 votes, against the Government candidate's 299; M. de Larcy 397, against 385; M. Blin de Bourdon 146, against 130. The Duke de Valmy's majority is not stated, but it is inferred to have been considerable. The Marquis de Larochejacquelin has also been re-elected by a larger majority than that by which he was first returned. It was universally believed in that capital that the Government had made the greatest efforts to prevent these gentlemen from being returned, and that their success was viewed by the Court as a severe mortification.—There has been a rumour of the discovery of a plot in one of the regiments of the garrison of Paris. The Ministerial journals do not mention this event, and it is believed the importance of the affair has been greatly exaggerated. From 12 to 15 soldiers it appears have been arrested, on the charge of being members of a political society, but there is not a single officer amongst the number. An official investigation into the facts is going on.—A notice has been issued by the directors of the French Post-office, informing the public that on the 4th of every month regular packets for the carriage of passengers will be sent from Marseilles to Alexandria. The packets consist of four steamers of 220 horse-power each, and they will leave Alexandria on their return on the 20th, touching at Malta both ways.—An English gentleman named Ward, who resided alone at 40, Rue de Londres, and was in his 74th year, was murdered last week. It is said that the discovery was made on Thursday evening by the servant, who, on going in between 7 and 8 o'clock, found the body of his master lying near the door of the saloon. A sort of collation had been laid out for two persons, of which the servant knew nothing previously. The murder was followed by robbery, as the secretaire had been opened and the papers were in perfect disorder. Four persons have been taken into custody on suspicion. The names are not given, but they are described as a dealer in second-hand articles, a house-painter, a basket-maker, and a servant.—The King paid a visit to the Château d'Eu last week, to inspect the progress of the Victoria Gallery.

SPAIN.—We have accounts from Madrid of the 29th ult. The Minister of Justice left for Valencia on the 27th—sent, it was said, in official quarters, by the Queen to meet her mother, to whom he carried an autograph letter; but his journey was ascribed to other motives, many well-informed persons affirming that its object was to prevent General Concha and others from injuring M. Gonzales Bravo and his colleagues in the opinion of the Queen-mother, whose arrival was likely to revive abundant intrigues.—Despatches had been received from Gen. Roncali, dated 22d and 23d ult., announcing that on the 26th or 27th he would be prepared to carry on active operations against Alicante, and that immediately after its reduction and the chastisement of the traitors, he would march upon Carthagena at the head of his entire force. The rebels of Alicante made a *sortie* on the 23d, and took a position in an olive grove, situate between the town and the fort of San Fernando. Gen. Concha had obtained possession of the Castle of San Julian, one of the outworks of Carthagena. It would appear that an English vessel having entered Alicante with a cargo of salt fish, in spite of the blockade, a remonstrance is about to be addressed on the subject to our Government.—Advices from Vittoria of the 26th of February state that a conspiracy has been discovered in the Encartaciones (villages in the Burgos mountains, and in the vicinity of Biscay); the result has been the apprehension of the curate of Lanzosequi, who was in the act of casting bullets, of the curate who was called Bilbao de Bilbao, and of M. Larumbe, formerly a Carlist officer. The conspirators had already recruited 200 men. It is said that this conspiracy has not been got up in Biscay, but that it comes from beyond the Pyrences. The object of the movement is to make a diversion in favour of the central insurgents. The instructions of the conspirators are, it is affirmed, issued from Bayonne and Bordeaux.—It was stated in Madrid that the Spanish Consul in Morocco had been put to death, and that the Government were preparing to avenge the outrage.—A telegraphic dispatch, dated Perpignan the 2d of March, announces that Queen Christina had been well received at Gerona, which place she was to leave on the 2d for Mataro. At Perpignan she had received Royal honours. She was expected to reach Madrid on the 15th, where extraordinary preparations were making for her reception.

PORTUGAL.—We have advices from Lisbon of the 29th ult. The Cortes re-opened on the 21st. The Minister S. Costa Cabral called on the Chambers for the continuation of the law of the 6th inst., suspending the guarantees of individual liberty, and the liberty of the press till the 31st March. The official accounts represent the insurrection as nearly suppressed. The Government troops appear to have been continually pursuing the insurgents from the 6th to the 24th, and never to have come up with them at the latter date. The latest intelligence from the Baron de Leiria states that the insurgents had not succeeded in crossing the Douro at Alva, and that he counted within two days to be able to report the suppression of the revolt. Senor Olozaga arrived by this packet at Southampton, on his way to London, having been expelled by the Portuguese Government at the secret requisition of the Madrid authorities, this expulsion being made the condition of assisting Senhor Cabral if needful with a Spanish army of intervention.

GERMANY.—We find the following in the *Allgemeine Zeitung*, of the 24th ult.:—"The interest felt in the fate of O'Connell and his country has produced at Bonn, in some circles, a resolution to collect all over Germany signatures to an address to the man whom the English call an agitator—Irish Liberator. In every city a list is to be opened, headed "List of Subscribers to an Address to Daniel O'Connell, the Man of Ireland." The lists are to be sent to Professor Waller, at Bonn. The Address is to be forwarded by the end of March. We have the draught of the address before us, but we do not think it proper to publish it till the persons from whom the invitation proceeds sign their names to it. A similar step is said to be contemplated at Ulm and other places."—

Letters of the 22d ult., from Berlin, contain the information that the King had, for three days previous to the courier's departure from the Prussian capital, been suffering from the measles, by which it will be recollected the Queen was lately attacked, but all the symptoms were of the mildest form. They also state that the house which Baron Alexander de Humboldt occupies at Berlin, and to which is attached a large garden filled with rare exotics, planted by M. de Humboldt, was sold to M. Roeniger, a merchant, who immediately gave notice to the tenant to quit. This fact having come to the knowledge of M. Joseph Mendelssohn, the banker, who learned at the same time that M. de Humboldt would quit it with great regret, he re-purchased the property from M. Roeniger, and wrote to Baron de Humboldt to say that it would remain at his service as long as he pleased.—It is stated in a letter from Carlsruhe, of the 22d, that the principal cemetery of that place has been recently the scene of repeated violations. More than forty graves have been opened, and all the gold and other valuable ornaments with which the bodies were interred stolen. As these atrocities were carried on with great caution on the part of the depredators, the crime would have remained unpunished if a young man had not been arrested in the act of offering for sale a silver handle of a coffin. This person instantly confessed, and denounced his associates, not less than thirty of whom have since been apprehended.—The last accounts from Goritz state that the illness of the Duc d'Angoulême is becoming rapidly more alarming.

ITALY.—The accounts from Ancona represent that city as in a state of great excitement, but Judge Allessandri, who was so seriously wounded by an assassin, is out of danger.—The Carnival at Rome has been extremely gay and the weather more like May or June than February. The Chesterfield hounds have afforded great amusement, not only to the English portion of the visitors, but to those from Russia and Austria, who entered with much ardour into the spirit of that English sport.

SWEDEN.—Accounts from Stockholm of the 16th ult. announce that the King's health was better on that day than it had been since the 9th. During each of the previous three nights his Majesty had slept six or seven hours in succession, and the pain in his foot had greatly abated. On the 16th the King transacted business with the Minister for Foreign Affairs and one of his secretaries. His Majesty had become thin, but his features were in nowise altered. His look was as lively as ever, and the animation of his thoughts and expressions was the same. A writer in a Paris paper states that the King's physicians were greatly astonished the other day, on bleeding his Majesty, to find the words *Liberté! Egalité! ou la Mort!* very legibly stained on his arm, and that they could not recover from their amazement, forgetting the part his Majesty performed in the first French revolution.

GREECE.—Advices from Athens of the 10th ult. state that King Otho has had a narrow escape from being poisoned, owing to the carelessness of his cook, who prepared a dish in a vessel in which verdigris had been allowed to collect. The illness, however, soon gave way to proper remedies.

TURKEY.—Important advices have been received from Constantinople, announcing that on the 9th ult. Sir S. Canning delivered to the Turkish Minister for Foreign Affairs a copy of a despatch from his Government, requiring the Porte to abrogate the law in virtue of which Christians who have professed Mahometanism are put to death if they again embrace Christianity. At the same time the Porte was threatened with the withdrawal of the countenance and protection of the British Government should it venture to reject the demand. Two days after a communication to the same effect was made to the Turkish Cabinet by the representative of France.

INDIA AND CHINA.—The Overland Mail has arrived with news from China to the 28th Dec.; Gwalior, Jan. 30; and Bombay, Feb. 1, brought by the Company's steamer Cleopatra, which arrived at Suez on the 19th inst. with 60 passengers. On the 28th and 29th December two severe battles were fought in the vicinity of the capital of Gwalior; one at Maharajpoor, the other at Punniar, in which our forces proved victorious. The British army under the Com.-in-Chief was about 14,000 strong, of which 300 were cavalry, and 40 pieces of artillery. The forces opposed to them were composed of 15,000 infantry, 3000 cavalry, and 100 guns. Our loss on these occasions has been very severe, the list amounting to 144 killed, and 866 wounded. Nine British officers have fallen in action or died of their wounds;—viz., Gen. Churchill, Colonel Sanders, Major Crommelin, Captains Stewart, Magrath, and Cobban, Lieutenants Newton and Leaths, and Ensign Bray. On the part of the enemy the casualties are estimated at 3000 to 4000 killed, and twice as many wounded. The fort of Gwalior was immediately after surrendered to our troops, and the leading chiefs at once tendered submission; our army retires within the Company's territories immediately, and we are not to occupy that country, nor in any way to intermeddle with its internal arrangements, but we insist upon the maintenance of a subsidiary force, consisting of seven regiments of infantry, with three cavalry regiments, with horse and foot artillery, to be taken charge of by Company's officers, under the control of the Indian Government. During the action the Governor-General, Lady Gough, and her daughter were frequently at the side of the Commander-in-Chief, exposed to great danger. The fortress of Gwalior is from its strength called the Gibraltar of the East. It covers the top of a hill nearly two miles long but narrow, the sides are very precipitous, and the highest part, which is at the north end, is 342 feet above the surrounding plain. The rampart conforms to the brow of the hill all round, and the area within is full of buildings, reservoirs of water, wells, and cultivated land. At the foot of the mountain on the east side is the town, which is large and well built. It is 68 miles south by east of Agra. The British took it by a nocturnal escalade in 1780. After this capture, the state was ceded to Sindia in the final peace with the Mahratta Chief. Doulat Rao Sindie died in 1826, leaving a revenue of a million sterling. He was succeeded by Junkojee, a son by adoption, who reigned till February of the present year, but with a government so imbecile and dissipated, that his soldiers were 14 or 15 months in arrear of pay, and some of his officers double that period in arrear. The consequence was continued mutiny and disorder, which extended to and disturbed our own adjoining province of Bundelkund. Junkojee left no child, but his widow, a girl of 12 years old, adopted a distant relative of the age of nine. Such were the personages with whom we had to negotiate for the removal of the Khasgee Walla, or Prime Minister, who had embezzled the revenues and left the troops in privation and turbulence. Even his surrender did not restore peace, and the Governor-General collected armies to march upon Gwalior and enforce good government. As the armies advanced Lord Ellenborough signified to the Gwalior durbar that he would insist on remodelling the Gwalior troops, putting them under English officers, and depriving the Maharajah of a magnificent park of 300 cannon, formed by the late Maharajah, and which was the pride of the nation. On learning this, the chiefs forbade the Prince or the Dowager Princess to proceed to the camp, and prepared for resistance. The first step of the Princess on returning to Court, was to assemble all the chiefs and officers, and the resolution was come to of opposing the further advance of our troops. With this view, Colonels Baptiste and Jacob, were directed to oppose the advance of the right wing of our army, while Colonel Secunder was to oppose our left. The first appearance of hostility was shown on the part of the enemy, by firing on the baggage party of Colonel Sleeman, and again on a reconnoitring party under Colonel Garden. This was so little expected that the first cannon-shots very nearly struck the elephant on which the wife of the Commander-in-Chief and some other ladies were proceeding. Under these circumstances, and especially under the want of their heavy artillery, the army fought at great disadvantage, more than counterbalanced, however, by the valour of the officers and soldiers. This attack of the enemy decided the course to be pursued, and General Sir. J. Thackwell, with the troops under his command, was directed to make an immediate attack on the enemy's left flank, supported by those under Major-Gen. Valiant. The enemy's centre was ordered to be attacked by the troops under the command of Major-General Dennis, supported by those under Brigadier Wright. To the left of this, with the view of threatening the right flank of the enemy, was the 4th brigade of cavalry, under Colonel Scott. The whole of this force, numbering 3000 cavalry, 12,000 infantry, artillery, and sappers, with 40 pieces of artillery, 10 of which were howitzers and heavy guns, was about a mile in front of Maharajpoor by eight on the morning of the 29th December. As it was found that the enemy had taken possession of the village the previous evening, some little alteration was requisite from the original disposition of the force, and General Littler's column was directed to advance from the village while General Valiant took it in reverse; these being supported by General Dennis's column, with the two light field-batteries. When these columns arrived in front of the village of Jourah, the enemy opened their fire from Maharajpoor, where several regiments, with 28 guns, had taken up their position. The brigade having deployed into line, were ordered to advance on Maharajpoor, from which issued a galling fire. Her Majesty's 39th, supported by the 56th Native Infantry, under General Littler, then advanced on the fort with the view of taking it in front, and having made a charge, cheering as they went, pushed forward bearing down every obstacle. So severe was this struggle that the enemy's artillerymen stood fighting at their guns until cut down in great numbers. Within the village where numbers of the enemy had taken refuge, a severe hand-to-hand encounter occurred, when the enemy, throwing down their matchlocks, resorted to the sword. General Valiant having at this time pressed upon the fort in order to take it in reverse, had to pass over 600 yards of ground. In doing this he was assailed with rounds of grape and shot, and having stormed the battery he entered the village, carrying everything before him. Twenty-eight guns were here taken, and so desperately was this position defended, that very few of the enemy escaped. Having finished this work at Maharajpoor, her Majesty's 39th, with the 56th Native Infantry, pushed forward towards the next position—Chonda. This was taken likewise, after a short but severe conflict. Here one of the enemy's tumbrils blew up, wounding Major Bray. A small work mounting four guns on the left of this position was assailed by the 39th Grenadiers, under Captain Campbell, supported by a wing of the 56th Native Infantry. This was taken possession of, and the guns captured. The action lasted about three hours, and no less than 56 pieces of artillery, with nearly the whole of their baggage and camp equipage, fell into our hands. The Governor-General was at times in the heat of action, distributing money and oranges among the wounded. The left wing of our army, under the command of General Grey, were equally successful at Punniar, which lies about twelve miles from Gwalior. General Grey had been directed to march direct on Punniar, for the purpose of hemming in the enemy, in conjunction with the right wing of our force. This, however, was frustrated, the enemy having subdivided their force so as to meet both of our divisions, and a portion having taken up a position at some miles distant from our right, completely screened by lofty hills, near the village of Mangore, a short distance from Punniar, where they began firing on our baggage. Brigadier Harriott, with a troop of Horse Artillery under Capt. Brind, took up a position beyond the baggage, where they returned the enemy's fire; but unable, from the impassable nature of the ground, to bring them to close quarters, they returned to the rear under a heavy cannonade. The enemy, however, having changed their position to one four miles on the east of General Grey's camp, it was resolved immediately to attack them. This was done by her Majesty's 3rd Buffs, with a company of Sappers and Miners, followed shortly afterwards by five companies of the 39th Native Infantry, some delay being occasioned, it getting dark before the remaining force, amounting to 2000, could be brought up. The Buffs and Sappers then attacked the enemy's centre, exposed to a galling fire; they drove the Mahrattas from post to post and captured a standard, with eleven guns. Brigadier Anderson, with the 2d brigade arrived only in time to finish the action. Having formed on the west of the hill, they attacked and routed the enemy, capturing the remainder of their guns. The result of these victories is the submission of the chiefs, and a treaty stipulating for the payment of the expenses of the campaign, as the condition on which our troops are to be withdrawn. Hitherto the Maharajah of Gwalior has enjoyed military as well as civil independence in British alliance. But the Governor General has reduced him by the new treaty to the enjoyment of merely civil authority. The army is to be paid and disbanded, and the troops which remain on foot are to be officered by English and organised as the troops of the Company are. The ministerial and civil authority has, it is believed, been entrusted to Mama Sahib, uncle to the late Rajah, who has always remained true to British interest. The Governor-General was expected to start for Calcutta on the 23d.—India is in general peaceful, the troops at Sukkur are rapidly recovering. The Commander-in-Chief has appointed Major-General Valiant to act as Quartermaster-General of her Majesty's forces, vice Churchill, deceased, until her Majesty's pleasure be known. Affairs in the Punjaub are by no means settled, and it was reported that the Affghans had taken possession of Peshawur. In Scinde matters are much the same. Our troops are recovering a little from their sickness. The last dates from China are up to the 28th of December. Business at Chusan and Canton is generally dull. Captain Brooke has arrived by this steamer as the bearer of the supplementary treaty and despatches from Sir H. Pottinger. The port of Shanghaye was officially opened on the 17th of November, by Captain Balfour, the new Consul. Colonel Butterworth, Governor of the Straits of Malacca, arrived at Penang on the 21st November.

UNITED STATES.—By the arrival of the packet-ship England at Liverpool in 16 days from New York, we have American news to the 16th ult., but it contains nothing of general political interest. The debates in Congress are of a mere local character. Her Majesty's sloop-of-war Vestal, having on board Mr. Pakenham the new Minister from the Court of St. James's, arrived at New York on the 12th ultimo. Mr. Pakenham had received many visitors, and had numerous calls from official and other persons, and much curiosity prevailed to learn the nature of his instructions, particularly with respect to the Oregon territory. On the 15th ult. he held a levee of the English residents, and on the 16th set out for Washington.—From Mexico we learn that it was reported at Vera Cruz, that the British Minister had intimated to the Mexican authorities, that upon the arrival of Mr. Fox, the new Minister from England, which was daily expected, the British flag should be hoisted on the staff of the Castle, in addition to the usual salute. The frigate Inconstant arrived at Vera Cruz on the 22d of January. She reported that the whole British West India fleet was to sail for Vera Cruz two days after she left.

Parliament.

HOUSE OF LORDS.

Monday.—The Marquesses of WESTMEATH and NORMANBY renewed their discussion as to whether or not the Roman Catholic Bishop, Dr. Cantwell, had suspended or superseded a priest named Murray from his clerical functions because he refused to collect the Repeal rent, but nothing definite was agreed upon.—On the motion of Lord BROUGHAM a bill for the improvement of the constitution of the Judicial Committee of the Privy Council was read a first time, with the understanding that it will be referred to a select committee before the second reading.—Lord BROUGHAM called attention to the fact of a man having been condemned to death in Louisiana for having assisted a slave to escape. He hoped that this public mention of the case would be sufficient to prevent so gross a violation of every principle of humanity and justice.—The Marquess of NORMANBY presented a petition complaining of the appropriation of an educational bequest to exclusively Protestant purposes in Ireland. The amount of the bequest was 7*l.* 10*s.* per annum, which was left for the endowment of the parochial school of Ballysax. The Rev. Mr. Birmingham, as rector of the parish, had been entitled to this sum, but he had established a school on the national system of education; and on the matter coming before the Board of Charitable Bequests, they disapproved of the application of the legacy to such a school, on the ground that it was contrary to the will of the testator, and also because the Rev. Mr. Birmingham had not complied with other conditions in the testament.—The Duke of WELLINGTON read the answer which had been returned by Lord Eliot to Mr. Birmingham on this subject, which was to the effect that the Government had no power to take cognisance of any decision of the Board of Charitable Bequests—a board of which the Lord Chancellor and Judges were members, and the only appeal from which is to a Court of Equity. It suggested that Mr. Birmingham should lay a statement of his case before the Lord Chancellor, who would most likely incline the board to reconsider the question. His Grace considered such a course as was pointed out to Mr. Birmingham to be the proper one, and recommended him even yet to adopt it. In the meantime, he promised to call the attention of the Government to the matter.—The Bishop of EXETER said the testator had bequeathed a sum of money for the purposes of education in the

parish, and left the care of the school to the minister of the parish; and the question which he wished to have answered was, whether under such circumstances, the Rev. Gentleman was justified in applying this fund as he had done, and converting a parochial into a national school. The bequest was manifestly entrusted to him for the purposes of education according to the principles of the established religion, and, therefore, he was not justified in doing what he had done, and the course taken by the Board of Charitable Bequests in this case was perfectly right.—After remarks from Lord CAMPBELL, the Lord CHANCELLOR, Lords MONTEAGLE and COTTENHAM, as to the proper construction of the words of the will, the petition was ordered to lie on the table.

Tuesday.—The Royal assent was given, by commission, to the Horse Racing Penalties Bill, the Offences at Sea Bill, and the Metropolitan Improvement Bill.—In reply to the Marquess of NORMANBY, the Lord CHANCELLOR stated that when the judgment of the House had been finally pronounced in the cases of the Presbyterian Marriages Appeals, he would immediately move for the reappointment of the Committee of last year, preparatory to proposing any legislative remedy.—The Marquess of CLANRICARDE put the three following questions to the Earl of Devon relative to the Landlord and Tenant Commission:—First, whether the Commissioners contemplated any alteration in the laws which affected leases or covenants between landlords and tenants entered into previously to the issuing of the Commission; secondly, whether they intended to report on the proportion which rent bore in Ireland to the value of land in various parts of Ireland; and thirdly, whether they would report the whole of the evidence taken before the Commission.—The Earl of DEVON having explained the progress made by the Commission, declined to answer the two first questions, but to the third replied, that it was the intention of the Commission to append to their report the whole of the evidence received by them. He added that there was nothing in the proceedings of this Commission which should necessarily interfere with any measures that might be contemplated for the improvement of the condition of the unemployed population of Ireland.

Thursday.—The House was occupied almost exclusively with the presentation of petitions and notices of motion. Among the general business, the LORD CHANCELLOR laid on the table a Bill to regulate suits relating to chapels and other property held for charitable purposes by persons dissenting from the Established Church, the object of which was to remove a hardship under which those persons laboured with respect to their chapels and burial grounds. He said he intended, after the second reading, to move that it be referred to a select committee. — The Bill was read a first time.

Friday.—The Marquess of LANSDOWNE moved for certain returns relating to Fees paid to Clerks in Petty Sessions. No grievance, he said, was more heavy upon the poorer classes of the country than the demands made upon them in the shape of fees. The result was, that there was almost an absolute denial of justice to a great number of persons who happened to be in a state of poverty. The returns were then ordered.—On the motion of Lord BROUGHAM, the Privy Council Bill was read a second time.

HOUSE OF COMMONS.

Friday.—After disposing of Mr. Duncombe's motion, the House proceeded with the remaining naval estimates. The chief interest of the debate, which was necessarily confined to technical details, was a conversation between Sir C. NAPIER, Capt. ROUS, Sir G. COCKBURN, and other naval members on the state of the service.—Sir C. NAPIER condemned the Penelope steam-frigate, the Albion, the Rodney, the Powerful, and other large class line-of-battle ships, and thought the best thing to do would be to take them to pieces and begin afresh. He said that when on the coast of Syria, the evolutions of the French fleet were far superior to our own, and attributed it to the French navy being manned by young men, whereas we kept old officers afloat who ought to be allowed to retire altogether.—Capt. ROUS condemned Sir W. Symonds's system of building, and referred to the builders of yachts at Cowes, and elsewhere, to prove the superiority of their system to that of the Surveyor of the navy.—Sir G. COCKBURN defended Sir W. Symonds; but admitted that his system was not perfection, and said that other builders were now employed on experimental vessels. After a long discussion on points of dockyard details, the votes were all agreed to.

Monday.—Mr. GLADSTONE introduced the new resolutions proposed to be adopted with respect to all future railway bills which have been recommended by the select committee on railways, and contained in their second report.—Mr. LABOUCHERE seconded them. The first of the resolutions was then proposed, when a debate of considerable animation arose, the contested point being whether or not it was equitable to exclude local agencies, and thereby local knowledge and experience, from the management of all future bills. The resolutions are peculiarly applicable to the cases of competing lines, and are intended to subject in future all railway bills to an ordeal similar to that of public bills.—An amendment was proposed by Colonel SIBTHORPE for the postponement of the adoption of the first resolution in order to give time for consideration. A division having been taken on this amendment, it was supported by 3 against 200. The resolutions were then adopted.—Mr. O'CONNELL having inquired if the Government intended to introduce a measure relative to Roman Catholic charities in Ireland was informed by Sir ROBERT PEEL that it was the intention of the Government to do so, in fulfilment of the promise contained in the Royal speech.—Mr. O'CONNELL then gave notice for Monday next of his intention to introduce a bill to alter the law relative to Roman Catholic charities and religious uses in Ireland.—Mr. BORTHWICK complained of the delay in carrying forward the Poor Law Amendment Bill, and censured the general neglect evinced of the interests of the labouring classes.—Sir J. GRAHAM was aware of the importance of the subject, but thought that the best course to be pursued with respect to the interests of the labouring classes was first to carry the Factories Bill, and then he would urge forward the Poor Law Amendment Bill; for both of which he hoped there would be ample time.—In reply to Sir R. Ferguson, Sir JAMES GRAHAM was understood to say that the Law Lords in the House of Peers being equally divided on the question of Presbyterian marriages in Ireland, it was the intention of the Government to resort to legislation on the subject; but that his colleagues in the other House proposed to re-appoint the Committee of last session, and to commit their report before taking legislative steps.—On the motion for going into committee of supply on the Army Estimates, Mr. WILLIAMS made a motion to refer the estimates to a select committee; but after a few words from Sir H. HARDINGE he withdrew his amendment.—Mr. S. CRAWFORD made his fourth attempt to stop the supplies by an amendment that the large amount of standing army and military force now kept up for the service of the United Kingdom is contrary to the principles of constitutional liberty, and dangerous to the rights of the people.—On a division there were for the Amendment 8; against it 87; majority 79.—The House went into a committee of Supply, and Sir H. HARDINGE brought forward the Army Estimates for the ensuing year. The whole estimate for the service was 5,984,524*l.*, being 240,579*l.* less than that of last year. On the vote for 100,295 officers, non-commissioned officers, and rank and file, for the service in Great Britain and Ireland, Capt. LAYARD suggested the expediency of adopting a plan of limited service, say ten years, which he believed would ensure a better class of soldiers and decrease desertions.—Mr. WILLIAMS moved a reduction in the vote of 20,000 men. The number of men proposed for this year was greater than the average of that for many years; and after deducting the number he proposed to reduce it, the force would still be greater than any that had existed for 20 years, viz., 115,290 effective men, including marines, pensioners, and Irish police.—Lord HOWICK blamed the way in which the commissariat department of the army was conducted in the Treasury-office. The amount of business, pressing on the Chancellor of the Exchequer rendered it impossible for him to have any supervision over it, and the consequence was that there was a lamentable want of economy in the arrangements, and of attention to the health and comfort of the troops.—The CHANCELLOR of the EXCHEQUER explained that the commissariat department was one strictly of account, having under its superintendence a large expenditure of public money, and that as now constituted it had effected a considerable saving without diminishing the comforts of the troops on foreign service. If those accounts were to be transferred to the War Office, as Lord Howick seemed to wish, the officials there would be no better competent for the task of supervision than those at the Treasury were.—Dr. BOWRING felt bound to support the amendment of his hon. Friend. He had always endeavoured, and would still endeavour, to "minimise" the army. The House divided—For the amendment, 12; against it, 114: Majority, 102. The vote was, after another proposition by Col. RAWDON to reduce it by 5000 men, which was not pressed to a division, finally agreed to. The sum of 3,431,764*l.* for the land forces of England and foreign parts, exclusive of the forces belonging to the East India Company, was likewise voted; after which the chairman reported progress.

Tuesday.—Mr. WARD gave notice that, on as early a day as possible after Easter, he should move for a committee of the whole House, to inquire into the present state of the temporalities of the Irish Church.—The first regular public business was a motion by Mr. WILLIAMS, for the purpose of establishing a rule that no opposed business or motion shall be brought on and discussed in the House after midnight. He complained of the long hours—the after-midnight legislation—the habit of members coming down from theatres, balls, routes, parties, and giving their votes in moments of hilarity on questions of which they knew little, and had heard less—and of the strong temptation to pass bills containing legislative jobs and blunders, when brought on for discussion at unseasonable hours. Four-fifths of the session were usually passed in idle debate (at this the ministerial benches cheered ironically)—as, for instance, in the year 1840, when the ministerialists, then in opposition, occupied the whole session with party discussions, for the purpose of getting place and power by a change in administration, which has produced no good result to the people of this country.—Mr. BROTHERTON seconded the motion. He was for many discussions but short speeches, and daylight legislation in conformity with the custom of our ancestors, and the practice of other legislative assemblies at the present day. Hopeless as he was of effecting the object, he would yet persevere in endeavouring to confine the House to decent business hours.—The CHANCELLOR of the EXCHEQUER, having noticed the smiling manner of Mr. Williams, could not persuade himself that he was in earnest. He felt grateful for his concern for the health of members, but that was more in danger from long speeches than late sittings, and late sittings were caused by early long speeches. He recommended Mr. Williams to leave the care of the House in the hands of Mr. Brotherton, who exercised his functions with so much amenity and discretion.—On a division, the motion was supported by 16, and opposed by 146.—Mr. TUFNELL then proceeded with a motion for a select committee to inquire into the cost of the Metropolitan Police force, and the manner in which the sums levied as police rate are assessed on the different parishes within the Metropolitan Police district. His speech was necessarily composed of details, illustrative of the inequality of the operation of the present system, to the principle of which, however, he was not opposed, neither did he censure the conduct of the police commissioners.—Mr. M. SUTTON, on the part of the Government, opposed the motion. An annual return of the expense of the police was regularly laid before the House; and the complaints upon which Mr. Tufnell founded his motion came chiefly from the parish of Marylebone, the rapid increase of which, since the passing of the Police Act, was extraordinary, being no less than upwards of forty-seven thousand new houses, comprehending more than seven hundred new streets, squares, and roads. But it was in the power of Marylebone, by an appeal to the magistrates, to get its inequalities rectified, without the necessity of any interference from the House.—After a few observations from Mr. BROTHERTON, Mr. TUFNELL did not think himself justified in pressing the matter, and it was therefore negatived without a division.—The LORD ADVOCATE of Scotland was then called on by the SPEAKER, to ask leave, pursuant to notice, to bring in a Bill to facilitate the disjoining or dividing of extensive or populous parishes, and the erecting of new parishes in Scotland. Leave was granted without opposition.—Lord ASHLEY then moved for a select committee to inquire into the mode of administering relief to the sick poor under the Poor-law Amendment Act, which was agreed to.

Wednesday.—The CHANCELLOR of the EXCHEQUER gave notice that he would on Friday, in committee of the whole House, submit a proposition for the reduction of the Three-and-a-Half per Cent. Annuities. He would also move, in a committee, a grant in aid of eight millions from the Consolidated Fund.—The House went into committee on the County Coroners Bill, the discussion of which occupied some time. One point in the debate was the mileage to be allowed to coroners, which, on a division, was settled at 1*s.* per mile, a distinct assurance having been given by Mr. PAKINGTON, the manager of the bill, that care shall be taken in the wording of the act to prevent the charging of double or triple mileage in case of more than one inquest being held at the same place. The bill, with verbal amendments, was agreed to, excepting the 22d clause, which was omitted.—The Marriage and Divorce Bill and the Teachers of Schools (Ireland) Bill were read a second time, and ordered to be committed on Wednesday.

Thursday.—Mr. PAKINGTON reported to the House, from the Athlone Election Committee, that W. Collett, Esq., was duly elected for that borough; and the minutes of evidence taken before the committee were ordered to be printed. Several motions which stood on the orders were postponed.—In reply to Mr. Macaulay, Sir R. PEEL said, that the daily papers always anticipate the Government in the receipt of the Indian news. He acknowledged himself indebted to the courtesy of the Editor of the *Times*, for a copy of the proclamation issued by the Governor-General of India; but was not then in a condition to say whether or not that copy was correct.—In answer to Mr. Labouchere, Sir R. PEEL stated that, from the authentic declarations of Ministers in France, he concluded the opinion of the French Government to be that there was no probability of concluding any formal convention with this country for the reduction of duties by actual stipulations; and added, that whatever impediments might have arisen in the way of a commercial treaty with France, they had not been created by the Government of this country.—Mr. PAKINGTON obtained leave to bring in a Bill to define and regulate the periods of holding Quarter Sessions in cities and boroughs. His object was to assimilate the law respecting boroughs to that prevailing in counties.—Mr. LABOUCHERE submitted to the House the following resolution:—"That an humble address be presented to Her Majesty, representing to Her Majesty the great importance to this country of the trade with the empire of the Brazils, and humbly praying Her Majesty to adopt such measures as may appear best calculated to maintain and improve the commercial relations between the United Kingdom and the Brazils." The right hon. member described Brazil as peculiarly adapted for commercial relations with Great Britain, and condemned the imposition of a 300 per cent. *ad valorem* duty on the sugar of Brazil upon entering our ports, while our manufactures were admitted into Brazil ports at the *ad valorem* duty of 15 per cent., as most impolitic, injurious to our trade, and destructive to our shipping. He contended that the duties imposed on Brazilian produce by the continental countries were less than ours, and that, therefore, their manufactures were superseding ours in the Brazil markets. As the treaty under which our present relations with Brazil was regulated will expire in November, he called on Government to reduce greatly the duties on exports from that country, and to admit them on terms satisfactory to the Brazilian nation. It was, he said, impossible to deny that the people of England were suffering under a stinted supply of sugar, and, with the exception of a repeal of the Corn Laws, he believed the opening wide of our ports to the sugar of Brazil to be the greatest benefit that could be conferred in the direction of free trade.—Mr. EWART seconded the motion.—Mr. GLADSTONE would studiously abstain from disclosing, in the month of March, the financial plans of Government, which ought not to be promulgated till April, so, whether or not the sugar duties were to be altered, he would leave them to guess, and the chances were at least even that the guess might be wrong. He resisted the motion on two grounds, because it censured the Government, and demanded changes without reference to the happiness of a large portion of the human race. He never knew a chain of reasoning so completely logical or demonstrative as that which connected the extension of the cultivation of Brazilian sugar with the increase of the slave trade. It was not simple slavery that they had to deal with; it was slavery fed by a direct slave trade with the coast of Africa. Our measures *were* diminishing the slave trade; our cruisers obstructed it and kept it in check, but any relaxation of vigilance would lead to its instant revival, encouraged as it was by the connivance of the inferior local functionaries of the Brazils. If we could effectually blockade the coast of Africa, and thus entirely suppress the slave trade, then the sugar of Brazil might stand in the same relation as the cotton of the United States. The culture of coffee, light and adapted to family arrangements, did not tempt the slave trader; that of sugar, requiring greater strength and labour, was the main incentive to the traffic, which consisted chiefly in the transport of youths just reaching the maturity of their physical powers. The import of copper ore was not a case in point; the change in the tariff was intended as a burden instead of a favour; and he believed that it would be found that any increase in our imports came chiefly from Chili, where it was raised by free labour. The failure of the mission of Mr. Ellis arose from the demands of Brazil; they asked, in the first instance, for admisssion on equal terms for their slave-grown sugar; and they only receded to a demand for a differential duty of one-tenth, which, with the duty on our colonial at 25*s.*, would have admitted theirs at 27*s.* 6*d.* The mission of M. Ribeiro had also failed; for the exaggerated importance which had been attached to the Brazilian trade threw insuperable difficulties in the way. In return for a mere margin of 2*s.* 6*d.* in favour of our colonial sugars, the Brazilians offered not to tax our woollens higher than 30, nor our cottons more than 40 per cent.! These duties were proposed, too, not for revenue, but for protection, in favour of the extension of Brazilian manufactures; and in an official report 60 per cent. was laid down as the minimum of a protective system. He believed that neither the Continental nations nor America were likely to supersede us in Brazil, and concluded by saying that, whatever taunts might be levelled against him, he was not prepared to pursue to all extremities commercial objects, and to throw into utter disregard those great questions which respect the general interests and happiness of mankind.—Mr. M. GIBSON supported the motion, and Lord SANDON opposed it.—Mr. BRIGHT reminded the House that the party now affecting so much concern about slavery was really the one which had propped up the system as long as it was possible to do so. Why all this concern about the morality of the Brazils, at the expense of the suffering people of this country? The object of the sugar monopoly was precisely the same as that in corn—to make the article scarce and dear; and the real question was not to be evaded by making it a mere *tu quoque* argument between Whig and Tory. There had been a long debate about Ireland—its two million and a half of paupers pouring their superfluity into Britain, and adding to the pauperism of England and Scotland, aggravating the general misery which these monopolies engendered. He appealed to Ministers to look to the common and universal interests of the country, and spurn the domination of mere monopolists.—Mr. F. BARING attributed the failure of everything to the rejection of his last budget, and declared his opinion to be that we were now too late to conclude anything like an advantageous treaty with Brazil.—Sir R. PEEL reminded the ex-Chancellor of the Exchequer of the danger of touching on so ticklish a subject as his last unfortunate budget. He also reminded him and Mr. Labouchere of their different sentiments in 1840, when a proposition was made to reduce the sugar duties. Figures for several years did not bear out the allegation of diminished supply and high prices; for last year was one in which the consumption had been greatest, and the price lowest. He admitted the great importance of sugar to the comfort and convenience of the community at large. But this was not to be obtained by yielding to unreasonable propositions; and though he hoped that a better spirit would actuate the Brazilian Government, that was not to be promoted by a vote of the House which would encourage their exaggerated ideas, and which would practically take the matter out of the hands of the executive Government. The Anti-Slavery Society, represented by its committee, had addressed a memorial to him, which was signed by the venerable Thomas Clarkson, in which they entreated that no relaxation of the differential duty on sugar might take place, a sufficient refutation of Mr. M. Gibson's assertion that they were opposed to it. No doubt we had the right to deal independently with the sugar duties; but with our vast colonial empire he very much doubted if legislation, with an exclusive view to cheap sugar, would prove true economy. They were now about to try an experiment suggested by Capt. Denman, that of blockading the whole coast of Africa in order to suppress the slave trade. God grant it may succeed! He hoped that the House of Commons would be animated by higher motives than those with which Mr. Bright seemed to be imbued. There *was* a time when members of his connection (the Society of Friends) would have repudiated the doctrines he had laid down. He referred all farther discussion to the time when the financial statement will be made.—Lord PALMERSTON defended Mr. Bright from the unfair construction which had been placed on his sentiments by Sir Robert Peel. Ministers had now shifted their ground; it was no longer slavery but the slave trade. Was this a foreshadowing of some farther relaxation in favour of our commerce? Criticising the character of the negotiations with Brazil, and the nature of the arguments by which the exclusion of its sugar is maintained, he contended that all resolved itself into the support of the West India monopoly. The Government, with its free-trade maxims, fell back on the monopolists, by whom they were borne into office. On a division there appeared—For the motion, 132; Against it, 205; Majority, 73.

Friday.—The order of the day having been read for going into committee of supply, and the Speaker having left the chair, the CHANCELLOR of the EXCHEQUER said, the subject he was about to bring forward was one of great importance, and if agreed to would greatly decrease the burden of the public debt. He was not the first Finance Minister that had recommended a similar proposition to the House. The resolution he should propose would cause a great annual saving. He was about to deal with a large amount of debt—amounting to no less than 250 millions. The time had now arrived when the operation might be effected with safety and security to the country, and he thought he might add with advantage. The right hon. gentleman then took a review of the state of the money market, and the high price of public securities during the last few years, and contended that the time had arrived when a reduction of interest might safely and justly be made. He then alluded to the expenditure and revenue of the country, which he considered was at present favourable to the operation he was about to ask the House to adopt. The income of the present year, he had every reason to believe, would exceed the expenditure. There were no deficiency bills at the Bank. They had all been satisfied, and since the 5th of April last it had not been necessary to apply to the Bank of England for any advance previous to the voting

of the supplies. There had been sufficient means at the disposal of Government to meet the demands of the public creditor without advances from the Bank of England. The amount of Three-and-a-Half per cent. stock, which he was about to deal with amounts, as he before said, to nearly two hundred and fifty millions, and consists of four several kinds of stock. The first is the Three-and-a-Half per Cent. Stock, originally created in 1818, which is the foundation of stock of this description, and amounts to 10,000,000*l*. The next is the reduced Three-and-a-Half per Cents, being a stock which was first established in the year 1760, originally as a Four per Cent. Stock, added to at various periods, and reduced to Three-and-a-Half per Cent. in 1824, when Lord Ripon was Chancellor of the Exchequer. It amounted to 67,500,000*l*. The next is the Three-and-a-Half p. Cents., originally founded in 1784, at 5 p. Cent., which in the gradual progress of the country, the growth of capital and confidence in our own resources, undergone two several reductions—one in 1822, when Mr. Vansittart was Chancellor of the Exchequer, from five per cent to four; and the other in 1830, when he had himself the honour of holding the office he now filled, and when it was further reduced to Three-and-a-Half per Cent., at which it has ever since remained. The last stock is the one called the Old Three-and-a-Half per Cents., which was an Irish stock created in 1787, and had been from time to time augmented to the sum of 14,600,000*l*.; the whole amount of these stocks was 249,600,000*l*., or, in round numbers, nearly the amount he at first stated. Now it might certainly have been legally correct to have dealt separately with these separate branches of the Three-and-a-Half per Cent. stocks; but he conceived that this course, though legally correct, would be essentially unjust. He thought it would not be becoming in a great country like this to take advantage of the fact of two particular branches of stock being of small amount, and to call on the proprietors who have invested their money in these funds to submit to a reduction, which, from their being small in number, they could not resist. He had therefore recommended that the same rule should be applied to all these stocks, and that the reduction of interest shall be made at once upon the whole of them. He therefore proposed the following plan:—To reduce the Three-and-a-Half per Cents. to 3¼ until the 10th of October, 1854, and to 3 per cent. to the 10th of October, 1874, (without any addition to the Debt), being a period of twenty years, during which the interest would not be reduced below 3 per cent. He stated that two other plans were open to him, but that they would all add to the existing debt. If the Three-and-a-Halfs were reduced to Three per Cents., it would add 10 millions, and if reduced to Two-and-a-Half per Cents., it would add upwards of 50 millions to the debt. He therefore preferred a more gradual and a more equitable plan, which would not relieve the present generation too much at the expense of their successors. After a few more observations, the resolutions were read and agreed to.

CITY.

Money Market, Friday.—Consols have advanced to 98¼; New Three-and-a-Half per Cents., 102⅛ to 102½, the latest quotation being 102¼; Exchequer Bills, 71 73; Bank Stock, 3½ per Cents., &c. shut for the dividends.

GAZETTE OF THE WEEK.—BANKRUPTS.—N. BLAKE, Edgware-road, linen draper—C. M. MOTTRAM, Friday-street, Cheapside, warehouseman—W. CHERRMAN, J HODSON, and W. OLIVER, Brighton, chinamen—W. R. HAWKES, Brighton, common brewer—E. TUCK, Haymarket, silversmith—J. HOOPER, York-place, High-street, Portland-town, and Vernon-place, Bagnigge wells-road, poulterer—J. TARVER, Daventry, Northamptonshire, iron-founder—C. J. RIDDEY, Little Creaton, Northamptonshire, innkeeper—C. COCHMAN, Edward-square, Kensington, carpenter—J. JOSEPH, late of Richmond, Surrey, but now of Peter's-hill, London, clerk to a book-keeper—H. TAYLOR, Bilston, Staffordshire, victualler—J. CRUMP, Stanway, Gloucestershire, corn-dealer H. EDWARDS, coal merchant, St. Albans—F. WILKINSON, boot-maker, King-street, Holborn—J. BARWICK, omnibus proprietor, Great Carter-lane, Doctors' Commons—G. FOORD, seed-merchant, Lenham, Kent—J. MONTEFIORE and J. BARROW, merchants, Nicholas-lane, City—R. BARKER, druggist, Manchester—J. DOUGLASS, rope-manufacturer, Newcastle-upon-Tyne—T. BREWER, pavior, Liverpool—R. LEWIS, wine and spirit merchant, Perrygroes, Flintshire—J. THOMPSON, iron-manufacturer, Stoke-upon-Trent, Staffordshire—J. D. PAYNE and LYDIA ROSHTON, furriers, Birmingham.

Metropolis and its Vicinity.

The Russian Company.—The annual dinner of this Company took place on Saturday, the Governor, W. Astell, Esq., M.P., in the chair, supported by the Russian Minister, Sir Robert Peel, the Chancellor of the Exchequer, the President of the Board of Trade, and the Paymaster General, and a great number of persons connected with the commerce of the city. In returning thanks for the toast of his health, Baron Brunnow the Russian Minister, adverted to the recent visit of the Grand Duke Michael, and said—"After an absence of five-and-twenty years, the Grand Duke was happy to see that whenever a Member of the Imperial family of Russia visits this country, he may be assured to find amongst you the true hospitality of good Old England—that unanimous feeling of friendship and respect which is in conformity with the relations so happily existing between Great Britain and Russia, and which I trust will always continue to subsist between the two Governments, and between the two great nations. Gentlemen, I feel a peculiar gratification in stating this my conviction before her Majesty's Ministers—before my respected friend at the head of her Majesty's Government, to whom I feel most particularly indebted for having honoured this meeting by his presence. If I am labouring under a certain difficulty in finding myself called upon for the first time to make a public speech in the presence of this great statesman, I can feel assuredly no hesitation whatever, but on the contrary I feel the greatest pleasure in expressing publicly and frankly my sincere gratitude for the kind and friendly support which he constantly lends me in the performance of my public duties for the maintenance of the friendly relations between Russia and Great Britain, whose good understanding is so essential, not only for their own mutual interests, but also for the preservation of the general peace of the world."—Sir R. Peel, in acknowledging the toast of "Her Majesty's Ministers," dwelt at some length on the relations of this country and Russia. "I hope," he said, "that the account which the Archduke Michael will give of us, after 25 years' absence in Russia, will induce a yet more illustrious member of that house—the Emperor of Russia himself—again to visit this country, and to receive from us within these walls the cordial demonstration we will then offer to his Majesty of respect for his personal character and the elevated station he occupies, and of the desire every Englishman must entertain to cement with him the feelings and sentiments of mutual good understanding. This friendly feeling in favour of amicable relations between Great Britain and Russia stands too, I trust, on a footing too well secured to be dependent upon any accidental circumstance, or upon the personal character of any man entrusted with high office or authority. But this, I must add, that so far as the exertion of any one man or the agency of any single individual can contribute to the promotion of this good understanding, the two countries are under the deepest obligations to that distinguished nobleman who is present here this day as the representative of the Russian empire at the Court of Great Britain. There may have been diplomatists occupying higher diplomatic station, but there never was a man entrusted with the confidence of the Crown who discharged the duties connected with his office in a more honourable or exemplary manner than those duties have been performed by Baron Brunnow. I can undertake to say that there never was a Foreign Minister more zealous for the promotion of the interests of his own country, or more unwilling to make any compromise of its honour, or of anything that could qualify his obligation to watch over the interests of which he is the representative; but, rising above all the petty arts of intrigue, and by the suavity and simplicity of his own conduct, his Excellency has gained the confidence of every Ministry with which he has been called upon to act, and without sacrificing the interests of his own country, has secured the personal good-will and esteem of all those with whom it has been his lot to act. This country is under the deepest obligations to him, and I therefore beg to propose to you a toast which is in the nature of a chartered sentiment with this Company, and one which I am sure you will receive with every demonstration of cordiality and enthusiasm—the toast of "Perpetual amity between Great Britain and Russia." Several other toasts were drank in the course of the evening, including the Chairman and Directors of the East India Company, the Governor of the Bank, &c.

The Carlton Club.—It is stated that the Carlton Club has purchased the leases of Mr. Evans, the bookseller's premises, and of those recently occupied by Mr. Mott in Pall Mall, which will be pulled down for the purpose of enlarging their present club-house and of building a splendid edifice. It is understood that several plans have been already sent in.

Society of Arts.—At the last meeting of this Society it was resolved to record on the minutes the regret of the Society at the death of their late housekeeper, Miss Cockings, who had faithfully served the Institution for upwards of half a century; and to pay the expenses of her funeral. A subscription was also entered into by the members to erect a tablet or monument to her memory.

The Humane Society.—The annual festival of this society was celebrated last week at the Freemasons' Tavern. Lord Morpeth was to have presided, but was prevented doing so by the ill-health of his father. In his Lordship's absence Sir E. Codrington took the chair. The honorary medallions given by the society to those who had been instrumental in saving life during the last year were then distributed; and among those who received them were Dr. Butler, the dean of Peterborough; Sir Walter Riddell; Captain James Corbin, of the Rainbow steamer; and Mr. Edwards, Jun., of Pentonville. After the medallions had been awarded, the usual annual procession of persons who had been saved from drowning marched round the room. The contributions amounted to upwards of 200*l*.

Improvements in the Borough.—A meeting of the rate-payers of the parish of St. George-the-Martyr was held last week, at which a petition to the Commissioners of Woods and Forests was agreed to, praying that a portion of any sum granted for the improvement of the metropolis might be applied towards the formation of a road through the district called the Mint to the Great Dover-road. The Mint was stated to be one of the most profligate places in the metropolis.

Free Church of Scotland.—Several meetings have been held during the week in different parts of the Metropolis, for the purpose of receiving the deputation from Scotland. The objects of the seceders have been explained by the members of the deputation, and several ministers of London Dissenting congregations have advocated the cause, and promoted subscriptions in its behalf.

Sons of the Clergy.—There will be no grand performance this year in the body of St. Paul's Cathedral, as has been the custom for a century past. Objections having been made to the erection of scaffolding, which interrupted the daily service, the Archbishop of Canterbury, acting under the advice of the Bishop of London, has decided that the festival is to be confined to the performance of one of the old services, with some increase of the choir.

The Destitute Poor.—The Bank of England, the East India Company, the Company of Mercers, and the Company of Grocers, have during the past week each subscribed 200*l*. in aid of the funds of the Bishop of London's Association for Visiting and Relieving the Poor at their own Dwellings. The gross amount of the fund of this association is now above 20,000*l*., and its operations are now extended over more than 60 metropolitan parishes.

The Coal Trade.—A large meeting of the coal merchants and factors of the city, and others interested in the coal trade, was held last week, Sir J. Duke, Bart., in the chair, for the purpose of petitioning Parliament on the proposed new tax of 5*d*. per ton upon all coals imported into London, to defray, as proposed by Government, the expenses of the contemplated Thames embankment. It was stated by the different speakers that from the reduced charges on many of the railways and canals, coals are introduced from the midland districts, not only into the metropolis but into parts of the country formerly supplied from London, there being a great difficulty in competing with these rivals, to whom the proposed tax would be a positive bounty, while it would be deeply prejudicial to the London coal trade. Petitions to Parliament against the measure were unanimously adopted.

Anti-Corn-Law League.—The usual weekly meeting of the League was held on Wednesday in Covent-Garden Theatre, the Hon. C. P. Villiers (in the absence of Mr. Wilson, who was attending a meeting at Manchester,) in the chair. The meeting was addressed by the Chairman, Dr. Bowring, Mr. Leader, Mr. T. F. Collier, and Mr. Fox.

Anti-League Meeting.—A meeting convened by Mr. N. Doran Maillard, the Secretary of the National Anti-League Association, and described upon the admission-card as a "Great National Anti-League Demonstration," was held on Monday evening at Freemasons'-hall. Sir R. P. Jodrell, Bart, was voted into the chair, but declined addressing the meeting. The business was therefore opened by two operatives forming a deputation from the Spitalfields Weavers Union, who proposed resolutions against free trade. Considerable uproar ensued, and a large body of Chartists, who occupied the Hall, proposed as an amendment a resolution condemning the League and the Anti-League as being both useless for the attainment of the People's Charter. After a great deal of riotous discussion the show of hands was in favour of the amendment, and it was moved that the Chairman do leave the chair, which was carried.

The Marquess of Northampton's Soirée.—The President of the Royal Society held his second conversazione on Saturday evening. It was a very full meeting, there being at least 350 fellows and visitors present. The Marquess was unavoidably absent from indisposition, but the honours of the reception were performed by Mr. C. S. Dickens and Viscount Alford.

Liberation of the boy Bean.—This boy, who, it will be remembered, was taken into custody for attempting to annoy the Queen by presenting a pistol at her carriage, as her Majesty was taking an airing in St. James's-park, and for which he was tried at the Central Criminal Court, and sentenced to 18 months' imprisonment, was liberated on Saturday, the term for which he was imprisoned having expired.

Fires.—On Saturday morning the workmen connected with the extensive premises of Messrs. Grissell and Peto, in Guildford-street, Lambeth, were alarmed by a discovery which left no doubt that a wilful attempt had been made to fire the premises. The spot fixed on by the incendiary was adjoining the workshed, containing several thousand pounds' worth of property. A reward of 200*l*. has been offered to any person who would give such information as would lead to the discovery of the offender; but no clue has yet been obtained.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending Feb. 24:—West Districts, 161; Northern, 189; Central, 243; Eastern, 250; Southern, 272; Total, 1115. Weekly average for the last five years, 946.

Provincial News.

Agricultural Meetings.—The following meetings in opposition to the League have been reported this week:—At Yeovil on Friday, Mr. Poole a tenant-farmer in the chair, supported by Mr. St. John Mildmay, Mr. Wyndham, Sir A. Hood, Bart., Mr. Moody, and a large number of landowners and farmers.—At Chesterfield on Friday, Mr. Clay of North Wingfield in the chair, supported by a great number of agriculturists; considerable opposition was manifested to the different resolutions by a portion of the meeting, who attempted to appoint a free-trade chairman, but the farmers on the platform would not allow them to get possession of the chair, and the resolutions against the League were adopted by a large majority.—At Bridlington on Saturday, E. H. Reynard, Esq. of Sunderland Wick in the chair, supported by a large body of tenant-farmers, landowners, &c., of the district.—At Lynn on Tuesday, Mr. J. Beck a tenant-farmer in the chair, supported by Lord Sondes, Mr. Bagge, M.P., the Mayor of Lynn, Capt. Fitzroy, Col. Mason, and about 550 tenant-farmers.—At Northwich on Tuesday, Lord de Tabley in the chair, supported by Lord Delamere, Wilbraham Egerton, Esq., Sir R. Brooke, Bart., J. Tollemache, Esq., M.P., Sir Philip Grey Egerton, Bart., M.P., Geo. C. Leigh, Esq., M.P., W. Tatton Egerton, Esq., M.P., and a large number of landowners and farmers.

Birmingham.—A public meeting was held in this town on Wednesday, to receive Mr. O'Connell, "to consider the propriety of petitioning Parliament, and take such other steps as may be requisite to protect the constitutional liberties of the British people from the dangers to which recent proceedings in Ireland have exposed them." Mr. G. Edmonds the town clerk presided, in the absence of the Mayor. Resolutions were adopted condemning the recent State Trials, and declaring "that the only guarantee for the attainment and protection of perfect civil and religious liberty is to be found in a full, fair, and free representation of the people, and this will be most effectually obtained by the friends of the people in Parliament enforcing the ancient constitutional principle, that redress of grievances should precede the voting of supplies." Mr. O'Connell then came forward. The whole meeting rose, and the applause which burst forth continued for several minutes. It was some time before he could proceed. Silence having at length been obtained, he spoke at great length on the affairs of Ireland, and on the mode in which the Union was obtained. "I rejoice," he said, "to see this expression of your feelings—I rejoice to see that there is no longer remembered the distinction of English and Irish—of Saxon and Celt—of Scotchmen, of Welshmen, of Englishmen, or Irishmen, but that you are determined on a union of sentiment and sympathy

amongst those who have a common interest in making a national exertion to secure, not the advantage of one portion of the empire, but the benefit of all. The first business which brought me amongst you was to express my gratitude for the feeling which has been expressed towards my country; but there was another object which I had, and that was to impress upon the people of both countries the advantage and importance of uniting in carrying out the one great object of putting an end to class legislation which has not a regard to the welfare of the poorer classes—of putting down oligarchical domination, and giving the principle of democratic liberty full swing and entire influence. In regard to Ireland it is a mistake to suppose that the repeal of the Union means separation. I deny that it means separation; and I would not demand or advocate a repeal of the Union if it meant separation; but I now state with all the solemnity which belongs to an oath, but without any of its profaneness—with all the solemnity of truth, that so far from looking upon Repeal to mean separation, I believe that it is only by obtaining a repeal of the Union that separation can be effectually prevented. The people of Ireland cannot endure the miseries and injustice under which they suffer, and it is my belief that, but for my influence—an influence which to me is astonishing—they would not have continued so long to endure it. I have laboured constantly with the people, and in defence of their rights, and they accordingly have confidence in me for my uniform advocacy of the liberties of their country. I repeat, it is a mistake to suppose that the repeal of the Union means separation. Why, for 600 years Ireland had her Parliament and continued united to England. Ireland had a parliament of her own during the American war, and at that period she allowed every King's soldier to leave the country and go to America, and made no attempt at separation. When an invasion was dreaded, the Irish people armed themselves against the French, the Spanish, and the Dutch. The French actually landed, but the Irish rushed as one man to preserve the connection with England and to prevent a foreign foe from polluting her soil. I, therefore, in seeking for the repeal of the Union do not seek for a separation, but I seek by that measure for the maintenance of the connection between the two countries. I deny that it could produce the effect of separation. I want a local Parliament in Dublin to do the business of Ireland—a Parliament to pass laws for the Irish people alone, and having nothing to do with imperial legislation. No, let England manage the imperial subjects—let her pass laws for England and Scotland, but let her have nothing to do with the laws relating to Ireland. I repeat it, therefore, that I seek no separation; but I am anxious to maintain the Union in the only way in which it can be made permanent—not as it is at present—not useful to England alone—but useful and advantageous to both countries. I now see better prospects opening before us in the sympathies and affections of the people of England. I rejoice at those prospects, and believe me that the gratitude of the Irish people is not of a transitory nature or of short duration. Need I tell you that the cheering which I have been greeted with to-day, and the cheers which are still ringing in my ears from the meeting at Covent-garden, will call forth their deep and lasting gratitude? Oh, this is indeed a majestic meeting, and it affords an evidence of your sympathy for which the Irish people will be deeply grateful. Believe me, that whatever faults we have to answer for, the want of gratitude cannot be numbered among them; whatever errors of conduct may belong to us, they are mistakes of reason, but our hearts are right. Oh, that cheer, given in Birmingham to-day, will extend all over Ireland; it will reach to the Giant's Causeway, and will be heard at Cape Clear; it will be re-echoed by the lofty hills of Connemara, and the mountain of Howth will, in a voice as if of volcanic power, announce to the people of Ireland the glorious intelligence that Englishmen are beginning to rally with us in our exertions to obtain our rights. Believe me that we are equally ready to sympathise with you in your struggle. Your Reform Bill has been a total failure, for the constituencies have been just kept up to the bribery point, and the crime has thus increased, for instead of bribing one person, now it is necessary to bribe as many as 150 or 200 individuals, and thus there is a multiplication of the crime, a crime which is one of that character that brings down the vengeance of Providence upon corrupt and profligate nations; and therefore I say that the person is not a man, he is not a Christian, who will not rally with us in putting down those atrocious corruptions; we will assist you in your struggle, and I am not one of those who would be for refusing instalments of public liberty, even when we may not get the whole at once. You often sing that "Britons never shall be slaves;" now I say that any man who has a right to have a vote and is not allowed to vote is a slave. I say that any man who is under laws which he has had no voice in making is a slave. I say that any man who has no control over his own property, only such control as must be regulated by laws made by others, and in which he has no voice, who has his industry and its remuneration regulated by such law, I say that man is a slave. I say that the man who has heavy taxation imposed on him by men over whom he has no possible control is a slave. Such a man is a slave, and belongs to the slave class. Ireland is aroused, and she will unite with you in your constitutional exertions. They may send me to a dungeon—they have the power to do so—but I'll be as merry there as I am here; and I can inform them that I will have as much influence over the people there as I have here. They may shorten the space of my daily walks, but they cannot shorten the space of my political exertions. We will co-operate with you in seeking for your rights; we will struggle with you until you are protected by the ballot—until you have the protection of the honest ballot—the ballot, which will allow every man to give his own vote, and not to give the vote of his landlord, or his employer, or his customer." He then adverted to the recent trials and denounced them as an attack on the liberty of the subject, which might be converted into a precedent against Englishmen to-morrow. At the close of his speech, Mr. S. Crawford addressed the meeting, and a petition to Parliament embodying the views of the meeting in regard to the Irish trials and an extension of the suffrage, was adopted. A vote of thanks was then passed to Mr. O'Connell.

Caistor.—On Sunday morning, the Rev. George Watson, vicar of this place and rector of Rothwell, shot himself in his sitting-room. He was discovered lying on the carpet partly dressed, but dead. He had placed an air-gun in his mouth. Mr. Watson was educated at Eton, and resided some time at Devizes after he left the College; he was about 50 years of age. From the evidence adduced at the inquest it appeared that he was so extremely sensitive to even the appearance of injury or disrespect, as to exhibit, when under excitement or in trouble, strong marks of mental aberration. Some months ago his morbid sensibilities led him to write a letter, in consequence of some fancied slight, to the wife of one of his parishioners at Rothwell, which was made the subject of a complaint to the Bishop, and led to the issuing of a commission of inquiry under the Church Discipline Act. On Friday week that commission was executed, and the members reported, not on the innocence or culpability of Mr. Watson, but merely that there was a *prima facie* case for investigation, adding to their return, however, the fact that Mr. Watson appeared to be labouring under great eccentricities and infirmity of mind. The Jury returned a verdict of temporary insanity.

Isle of Man.—The following paragraph is from the *Mona Herald*:—"On Saturday last about thirty individuals left this port by the mail packet for Liverpool, on their way to the 'New Jerusalem' of Mr. Joe Smith, the Mormon impostor, in the far west. Mr. Kelly, late of the Rhean near this town, and his family, embark for Liverpool this day, and will sail thence on Friday on their way to Nauvoo."

Liverpool.—The annual Christmas *soirée* at the Mechanics' Institution, having been postponed in order to suit the convenience of Mr. Charles Dickens, who had promised to preside on the occasion, the event came off on Monday week. Long before the hour appointed for the opening of the doors, the street was crowded with persons anxious to obtain admission, and double rows of carriages, cars, and other vehicles lined the street, from Hope-street to Rodney-street. Most of the principal inhabitants and municipal authorities were present on the occasion. "It would be difficult to describe," says the *Liverpool Mercury*, after giving a full description of the proceedings, and a full report of the speeches, "the pleasure which numbers of the townsmen and townswomen experienced from the visit of Mr. Dickens. The inimitable and philanthropic 'Boz' has made an era in Liverpool from which many circumstances will be dated."

Manchester.—A destructive fire broke out in this town on Saturday morning in the pile of buildings situated between York-street, George-street, Pine-street, and St. James's churchyard, which were erected a few years ago by the Rev. Jas. Taylor. They were seven stories high, and were occupied by Messrs. Nelson, Knowles, and Co., and other manufacturers. In the course of a few minutes, the whole block of buildings was in flames. This rapidity of the conflagration was the result of the construction of the warehouses. All the outer walls and most of the walls of the various floors, were lined inside with wood; every warehouse had its well-hole, and the whole were connected in the attic stories and roofs; so that when the fire reached the top of one warehouse, to which it speedily ascended by the well-hole, having made its way to the timber of the roof, it was carried by the breeze along the whole range. The firemen soon saw that it was hopeless to attempt to save any portion of this block, and they therefore directed their attention chiefly to the surrounding warehouses, which at various points were repeatedly on fire, and several of them in imminent danger. In York-street the warehouse of Messrs. Makin and Co., silk-manufacturers, was on fire and sustained some damage; the adjoining warehouse, that of Messrs. J. Le Mare and Sons, silk-manufacturers, was also partially damaged. At the back of the block in Pine-street, the warehouse of Messrs. Amschel, Tobler, and Co., merchants, is almost wholly destroyed, as are all the warehouses in the same block. On the opposite side of George-street is a warehouse at present unoccupied, but recently taken by Messrs. Wright and Lee, and in which the joiners were at work. It repeatedly caught fire from the great body of flames issuing from Mr. Townend's warehouse; but with great exertions the firemen were enabled to prevent the flames from doing it much injury. The loss is said to exceed 100,000*l.*, but the buildings are insured.

Oxford.—An inquest has been held on the remains of Rabbi Jacobs and his daughter, when, after five hours' investigation, the Jury returned a verdict of "Accidentally burnt," nothing having been elicited to show how the fire originated. After the inquest the bodies were sent to the German Jews' Synagogue, in London. The Hebrew Bible which was destroyed was printed in Poland on vellum, and was considered a very rare and costly edition. The trumpets, Rabbi's vestment, and several other articles used in Jewish worship, were destroyed. The synagogue used by the Oxford Jews was held at deceased's house.

Scilly Islands.—On the morning of the 22d ult. the Dutch East Indiaman, Nickerie, was totally lost on Rosewear, one of the small uninhabited islands of this group, and only two seamen out of a crew of 21 persons were saved. A letter from St. Mary's gives the following particulars, communicated by the survivors:—"It appears that the vessel was on her passage from Batavia to Rotterdam, with a cargo of coffee, tea, sugar, and other articles. On the night of the 21st the vessel encountered a heavy gale of wind from the westward, which she bore gallantly against. As morning approached, the weather became thick and hazy. The ship was not brought to, but they continued the passage, as they thought in safety, but suddenly they observed the Scilly light in a direction which they knew to be dangerous to the vessel; and before it was possible to avoid it, the ship went on the ledge of rocks on the Rosewear Island, and with such force as to throw the mainmast overboard. They describe the scene that immediately ensued to have been of a heart-thrilling description. While some were lashing themselves to the rigging, another dreadful crash took place, and in an instant the ship parted in several places, and all perished excepting an English and a Dutch seaman, who were saved by lashing themselves to fragments of the wreck which were washed ashore; but they were in a most pitiable condition, and suffered severely from the cold. They remained walking about the island for two days before discovered." Another letter observes that the situation of the wreck was such, that it was impossible for it to have been seen from any of the inhabited Scilly Islands, or in all probability the crew would have been saved. No part of the cargo can be recovered, and scarcely anything of the vessel or materials. On Monday night the remains of two of the crew were thrown upon the beach, and on Tuesday three other bodies were picked up. The loss of the vessel and cargo is estimated at 15,000*l.* The Thames steamer, it will be recollected, was wrecked on the same spot three years ago.

Wainfleet.—The coast of Lincolnshire has suffered severely from the recent gales. On Wednesday week the City of Carlisle steamer was totally lost on a dangerous shoal called the Dog Bank, a few miles from this harbour. After she had struck the crew succeeded in getting her afloat again, but she had sustained such injury and the water gained so rapidly on the pumps, that she sunk a few minutes after. Notwithstanding the violence of the gale the crew saved themselves in the ship's boat and were picked up by the life-boat and brought into Wainfleet Haven. The steamer was on her voyage from Honfleur to Goole.—The damage done to the shipping off the coast during the late gales has been immense, more particularly off the eastern and northern, and it is estimated that 40 vessels have been wrecked, with a great loss of life.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1195*l.*; Birmingham and Gloucester, 1652*l.*; Eastern Counties, 3077*l.*; Edinburgh and Glasgow, 1759*l.*; Great Western, 10,617*l.*; Grand Junction, 6259*l.*; Glasgow, Paisley, and Ayr, 1191*l.*; Great North of England, 1249*l.*; London and Birmingham, 12,888*l.*; South Western, 4294*l.*; Blackwall, 582*l.*; Greenwich, 588*l.*; Brighton, 2260*l.*; Croydon, 169*l.*; Liverpool and Manchester, 3422*l.*; Manchester, Leeds, and Hull, associated, 5349*l.*; Midland Counties, 2147*l.*; Manchester and Birmingham, 2763*l.*; North Midland, 3944*l.*; Newcastle and Carlisle, 1400*l.*; South Eastern and Dover, 2298*l.*; Sheffield and Manchester, 484*l.*; York and North Midland, 1466*l.*—The Bristol and Exeter Company at their meeting last week announced a dividend of 1*l.* 8*s.* for the half-year, free of income tax, the disposable balance out of which this amount will be paid being 140,000*l.* The line will be finished next May, which is earlier than anticipated, and within the terms of the contracts made.—At the meeting of the Edinburgh and Glasgow company the dividend declared was at the rate of 5 per cent. per annum. The receipts amounted to 59,132*l.*, the expenditure to 32,535*l.*, leaving, with an unappropriated balance, the sum of 30,030*l.* divisible among the proprietors. The question of Sunday travelling was again revived and discussed at length, but Sir Andrew Agnew failed in his attempt to carry his resolution.—The Hull and Selby company at their meeting have announced a dividend of 27*s.* 6*d.*, exclusive of income-tax. The report mentioned an increase of traffic in the several departments. Large payments in advance have been made on account of the quarter-shares of holders, to whom 5 per cent. discount has been allowed.—At the meeting of the Glasgow and Ayr company a dividend of 20*s.* per share has been declared. The question of supporting the line of steam-boats between Fleetwood and Ardrossan was discussed with considerable warmth. It appears that the working expenses of the company have been reduced from 50 to 37½ per cent., and a general system of economy has been introduced. A motion for reducing the number of directors was brought forward, but negatived.—At the meeting of the Birmingham and Gloucester Company an improved dividend of 30*s.* per share was declared, and the goods traffic is steadily increasing. The total receipts for the half-year were 51,350*l.*, the expenditure 37,632*l.*, leaving a disposable balance of 13,762*l.*—Several meetings were held last week to consider certain clauses in a bill now before Parliament, by which the Great Western Company endeavoured to obtain the power of prohibiting any "carrier, innkeeper, warehouseman, or other such person," to include in one package to go by railway two or more parcels of goods,—the object being to compel payment to the railroad company of their extra charge for small parcels. Petitions against these clauses were unanimously adopted, and on Monday Mr. Russell, M.P., the chairman of the company, announced in the House of Commons that the

directors had abandoned the clauses objected to.—The Postmaster-General has ordered a post-office to be opened at N[illegible] station, by which passengers will have an opportunity of receiving and forwarding letters at that place. The Normanton station is at the junction of the Manchester and Leeds and York and North-Midland lines with the North-Midland, about three miles from Wakefield and nine from Leeds.

IRELAND.

Dublin.—The weekly meeting of the Repeal Association took place on Monday, at the Conciliation-Hall, Capt. [illegible] in the chair. Mr. John O'Connell begged to say a few words respecting a statement which Sir J. Graham was reported to have made in his place in Parliament. Sir J. Graham had asserted that it would not be safe to announce the name of the gentleman who attended in this city for the purpose of reporting on the part of Government. Now, he denounced that statement as untrue, for his name had never been made any secret of. He had distinctly and emphatically informed the committee of the Association of the nature of his duties, and had attended all their meetings openly and avowedly in the character of a Government reporter. A letter from Mr. O'Connell was then read, announcing his intention to remain in England for the public dinner to which he had been invited, and stating his conviction that he ought to lose no opportunity of uniting the middle classes of both countries. The following are extracts:—"I do assure you that I meet many Englishmen in what I may call the Precursor state, declaring positively that they will assist in 'the Repeal' if the present Government persevere in its present impolicy with regard to Ireland; and, as such perseverance is certain, I reckon upon having much English assistance, even before this session is over, in advocating Repeal. I am sorry to see by the papers that some individuals countenance the calumnies of our enemies, by insinuating the intention to abandon the Repeal agitation; that our enemies should say so is quite natural, because it may be the means of creating jealousy and suspicion in our ranks; but that honest Repealers should entertain such a notion is quite preposterous. What has the Parliament done for us? Nothing. What does the Government intend to do for us? Nothing. Why, then, should there be any relaxation? English sympathy induces us to be more moderate in tone and conciliatory in language; but it leaves untouched and undiminished the inevitable necessity of the restoration of the Irish Parliament for any redress of Irish grievances. Away, then, with the idle fear of any postponement, much less of the abandonment, of the Repeal agitation; nay, it is quite to my mind, perfectly manifest, that the inevitable tendency of all that has lately occurred is to promote the tranquil attainment of the Repeal. I repeat, we want two things in Ireland:—perfect peace and quiet amongst the people—perfect, calm, cool, steady perseverance in looking for the Repeal. The British Government has shot its bolt. It has exhausted its only resource—military power. Military power is truly formidable if resisted, but utterly futile in the case of a persevering non-resistance. Even in actual military affairs a sand-bag is a better protection than a granite rock; but, when no physical resistance whatever is given or intended, military power is as futile as it is expensive and unconstitutional, and can never continue to be for any length of time the sole instrument of Government. We will therefore persevere in quiet and calm determination. The intelligence of England appreciates the necessity we are under of seeking for the Repeal. Let us deserve the continuance of the sympathy of that people by the peaceable and conciliatory modes of perseverance in seeking that which I believe not to be remote—the restoration of our domestic legislature. Hurrah for the repeal!"—Mr. W. S. O'Brien brought forward a lengthy report from the Parliamentary Petition Committee lately appointed by the Association, in which the various topics in the Queen's speech, having reference to Ireland, were discussed. The hon. gentleman, after bearing testimony to the zeal and talent of the committee, by which he was assisted in concocting the report, made an earnest appeal to the youth and intellect of Ireland to join the Repeal agitation. He implored the gentler sex to lend their aid to the cause of their country, by reserving their hearts for those who laboured for Ireland. The matrons should suspend their welcome to their husbands when they returned home, after the labours of the day, until they inquired what they had done for Ireland in that day; and the mothers should teach their babes to lisp Repeal with their earliest accents. These were the arts by which a country might be rendered great; that was the conspiracy in which they were engaged. The hon. gentleman concluded by moving the adoption of the report. On the motion of Mr. Maher, M.P., the thanks of the Repealers of Ireland were voted to the hon. gentleman for the labour which he had devoted to the framing of the report. Mr. Barry (barrister), brought forward a motion, of which he had given notice, to the effect that the Association should tender a vote of thanks to those liberal members of the House of Commons who, by their reception of Mr. O'Connell, manifested their dislike of the attempt lately made to suppress public opinion in Ireland. He asserted that the Association was determined never to swerve from the present agitation so long as they were permitted to continue in their peaceful efforts. Dr. Nagle seconded the motion, which was carried amid loud cheering. The rent for the week was 495*l.* 4*s.* 9*d.*

Wexford.—At the Wexford assizes, the trial of two men, Thomas Butler and Patrick Dwyer, for the murder of Butler Bryan, Esq., which took place on the 27th May, 1841, has excited much interest. Butler was tenant of certain lands in the county Tipperary, purchased by Mr. Bryan, and was evicted from his holding. In revenge, it is alleged, he hired two men to proceed to Mr. Bryan's residence, in the county Wexford, and shoot him. One of them is the prisoner Dwyer, the other, named Sullivan, has turned approver. The case occupied the entire of Friday and Saturday, and although the evidence of the approver was clear and consistent, the jury returned a verdict of Not Guilty.

SCOTLAND.

Edinburgh.—On Wednesday in the Presbytery of Edinburgh the Tolbooth case was brought under discussion and finally disposed of by that body. When this case was first brought forward the presentation was sustained by the Presbytery, and objections to the presenter called for. Twelve objectors appeared at a subsequent meeting, and urged that Mr. Smith's preaching did not "edify" them, which objection was allowed to be valid by the Presbytery, acting as they said under Lord Aberdeed's Bill. On Wednesday Dr. Bryce brought forward the "call" to Mr. Smith, which had been signed by six heads of families, two members, and six seat-holders in the church. He urged that although the "call" had ceased by the Act of 1712 to have any legal effect, it was still a proper and a prudent measure to continue, in an ecclesiastical point of view. He concluded by moving that the Presbytery, having taken into consideration the call to the Rev. Mr. Smith, presentee to the Tolbooth, find that it is a good and valid call; but in respect of the judgment pronounced with regard to the objections, finding that they are not in a position to proceed with the settlement, they refer the matter to the ensuing synod. After some discussion the Presbytery rejected this motion by a very large majority.—The local papers state that Lord Melgund, eldest son of Earl Minto, and heir to a very good landed estate, has declared himself in favour of a total repeal of the corn-laws. His uncle, the late Member for Roxburgh, has also sent in his adhesion to the League.

Aberdeen.—At the annual meeting of students, held on Friday for the election of the Lord Rector of Marischal College and University, the votes were equally divided between the Marquis of Breadalbane and the Marquis of Bute. The result is, there can be no rector for this year.

Law.

HOUSE OF LORDS.—*Hoare* v. *Byng.*—The question in this case depended on a passage in the will of the last Earl of Strafford, dated in 1774. After giving the real and personal estate to his wife for life, it thus proceeded:—"And afterwards all my personal and landed estates to my eldest sister, Lady Anne Conolly, for her life, then to the eldest son of George Byng, Esq., of Wrotham-park, and afterwards to his second, third, or any later sons he may have by my niece, Anne, Mrs. Byng, and then to the eldest son and other sons successively of the Earl of Buckingham by my niece Caroline." The question was, whether this bequest vested more than a life estate in the personalty on any of the persons thus named after Lady Conolly; and whether, therefore, the residuary estate therein did not pass, after the death of the persons named, to Lady Anne Conolly and her representatives, as next of kin to the testator. The Vice-Chancellor had decided in the negative, and the House, after hearing Mr. Kindersley and Mr. G. Turner for the appellant, and without calling on the Solicitor-General and Mr. Romilly, held it to be a good decision, and ordered it to be affirmed.

JUDICIAL COMMITTEE OF THE PRIVY COUNCIL.—*Holt* v. *Guege.*—This was an appeal from a sentence of the Prerogative Court of Canterbury, in a cause of proving the last will and testament of the Rev. Henry Masterman, late of Melton Abbas, Dorset, dated the 7th of December last, and which was promoted by the appellant against the respondent, the next of kin. In consequence of their Lordships being divided in opinion, the cause had been re-argued by one counsel on each side. The Lord Chancellor delivered the judgment of the council. In this cause his Lordship said it was not thought necessary to decide the question whether or not the instrument was signed before the witnesses called in to witness the execution, but assuming that it was so signed, their Lordships were of opinion that the nature of the document not having been explained, the mere circumstance of calling in witnesses was not of itself sufficient, and did not amount to an acknowledgment of the signature. Their Lordships were also of opinion that the instrument was not signed in the presence of witnesses, and that the cases referred to did not apply, as they arose under the old law. Their Lordships did not think it necessary to decide the very important question whether the new Act made any difference. The judgment of the court below was affirmed, costs of both parties to come out of the estate.

COURT OF CHANCERY.—*Corporation of Dartmouth* v. *Holdsworth.*—The Lord Chancellor delivered judgment in this case, which was argued some time ago. His Lordship said the suit was instituted to set aside a bond given by the Corporation of Dartmouth to Mr. Holdsworth, to secure the repayment of 1200*l.* expended by their request, and for their benefit. Mr. Holdsworth was a person of great influence in the borough, and formerly stood in the situation which, in less pure times than the present, was called its patron. Thirteen or fourteen writs of *quo warranto* had been served on the Corporators, and the question arose, whether they should be defended out of the Corporation funds. A meeting was held, at which, though no formal resolution was come to, all the members present agreed in requesting Mr. Holdsworth to advance funds for the defence, and promising repayment. At a second meeting a bond was given, and interest was paid upon it for some years. In the mean time the Municipal Corporation Act passed, and fresh men of purer views and motives came into the Corporation, and raised a dispute as to the legality of Mr. Holdsworth's bond. An action at law was brought upon it, and it was held good, on the ground that when the title of the Corporators was attacked, it was a legitimate use of the Corporation funds to defend them. It appeared that at the meeting the members present inquired of the town-clerk if the bond could be legally paid from the income of the Corporation, who stated that though they were not originally bound to give it, the Corporation could pay it if they thought fit. To this representation the Corporators replied, that they were bound in honour to pay the bond, and expressed their desire to do so. It was clear, therefore, there was no misrepresentation as to the legality of the Corporation; they knew they were not legally bound before the bond was given. His Lordship in conclusion said he was of opinion the plaintiffs had no equity, and the law had been already determined against them. The judgment of the Vice Chancellor of England must therefore be confirmed, and the appeal dismissed with costs.

COURT OF EXCHEQUER.—*Pickford and another* v. *the Grand Junction Railway.*—This was an action to recover compensation in damages from the defendants under the following circumstances:—The plaintiffs are the celebrated carriers, and like many other private establishments of a similar character have suffered of course very materially since the various railways have come into their full force of working. They furthermore complained that upon some of the lines advantages are offered to some of their competitors which are denied to them. In the present instance it seemed that they had sent a quantity of goods to the station at Liverpool for the purpose of their being forwarded to Birmingham; that a portion of such goods consisted of pork and other perishable articles; and that they were not forwarded and delivered in due time. It further appeared that in the present instance the goods had been sent to the railway station after 4 o'clock in the afternoon, and were not forwarded by the goods-train that left at 8 o'clock the same evening. On behalf of the defendants it was contended that inasmuch as there were certain rules and regulations by which it had been found necessary to guide the arrangements and proceedings of the railway, and that one of them was to the effect that "all goods intended to be forwarded by the 8 o'clock train must be delivered at the station at Liverpool before 4 o'clock on the same afternoon, in order to ensure their being duly forwarded;" and that as the plaintiffs had not acted in accordance with such rule, the company could not be held liable. Verdict for the defendants.

VICE-CHANCELLOR'S COURT.—*Sir Godfrey Webster* v. *the Rev. John Littler.*—This was a motion by the Rev. John Littler, the vicar of Battle, in Sussex, to dissolve an injunction which had been obtained *ex parte* against him by the plaintiff Sir Godfrey Webster, in November last, restraining him from cutting down certain timber, which was alleged to be "ornamental," on the vicarage of which the plaintiff was the patron. The injunction was granted upon the affidavit of the plaintiff's attorney, which stated that the defendant had cut down quantities of young ornamental trees, to the value of not less than 7*l.*, and that he sold or intended to sell them (as the witness believed) and apply the proceeds to his own use, and threatened and intended to continue such acts of waste upon the ornamental timber, and convert the proceeds to his own use. The affidavits on behalf of the defendant entirely disproved this charge, and showed that the timber was not ornamental from its situation, being entirely out of sight of the vicarage, and that the trees were not young, and had not been cut down for the purpose of sale, but to repair certain fences which had been grubbed up by the grandfather of the plaintiff; who, the defendant endeavoured to show, had improperly assumed a right to do so, which he had been deprived of by an alteration in the tenure of the land. The Vice Chancellor said, it turned out, the affidavit on which the injunction was granted was totally false. Without entering into the merits of the case it was the merest matter of course to dissolve the injunction with costs.

COURT OF COMMON PLEAS.—*Lord W. Paget* v. *the Earl of Cardigan.*—This case, which has been so long talked of, and been a matter of speculation whether it would ever come to trial, was tried last week before the Lord Chief Justice and a Special Jury. Sir T. Wilde stated the case, which was to recover damages for alleged criminal conversation with the plaintiff's wife. The Solicitor-General appeared on behalf of Lord Cardigan, and at the conclusion of his speech the Foreman said they would save the Chief Justice the trouble of summing up, as they were all unanimous in finding a verdict for the defendant. The Court was crowded to excess during the trial, and the verdict was received with loud applause.—In connection with this case, or rather with the circumstances which led to it, we may here notice the trial of *Mr. Holt*, the editor of the *Age*, at the Central Criminal Court on Monday for a libel on Lord W. Paget, accusing him of having concocted a scheme to extort money from Lord Cardigan by bringing forward a charge which he knew at the time to be false. After a long trial the Jury found the defendant *Guilty* on all the counts of the indictment. The Recorder said, that as the defendant was already in custody under another sentence (a libel against the Duke of Brunswick) he must be remitted back to the care of the officer, and he would consult the Judges as to the nature of the sentence to be passed upon him.

COURT OF QUEEN'S BENCH.—*The Custom House Frauds.—The Queen, on the Prosecution of the Commissioners of Customs, against Peter Williams, Charles Mottram, and John Horsley.*—This was an indictment arising out of the late frauds upon the Crown through the Custom-house revenues, to the extent of about half a million of money, with the history of which, almost in minute detail, the public are already familiarly acquainted. The bill of indictment was found at the last June sessions of the Central Criminal Court, and removed by *certiorari* at the instance of the Commissioners of Customs. The brief summary of the case is, that defendants were carrying on business in partnership in the way of French goods and the like, and in the month of September, 1840, by conspiracy, &c., carried through the Custom-house goods to the amount of 530*l.* or thereabouts, paying only 40*l.* instead of 88*l.*, thereby defrauding the revenue of the difference. The defendant Williams had pleaded guilty, Horsley had not been taken or appeared at all, and Mottram said that he knew nothing about it. Mottram had been a linendraper in an extensive way of business in Lamb's Conduit street, and in January, 1840, relinquished that business and went into partnership with the other defendants in Wood-street, Cheapside, as Manchester and silk warehousemen and importers of "foreign fancy goods." They became bankrupt, and there was a fiat, which produced a great sensation, and the examination of Mottram was adjourned for three years. Burnby, a clerk in the Customs, of whom the world has heard so much, tempted the firm, and all would have fallen but that the first attempt resulted in an abortion, as the only mode of avoidance of manifest detection. Fraud succeeded, however, time after time afterwards, but Mottram, who alone now at the trial attempted a defence, averred that he had no knowledge of or connexion with anything but the abortion, which would not support the indictment. About all that supervened he was wholly innocent and unconscious. In fact, he was so shocked at the first attempt, or the failure of it, that, though a partner in the house, he never, as his counsel from instruction stated, had the faintest knowledge of, or idea about, any of the subsequent transactions connected with the revenue duties. Burnby, however, who has been dismissed from the service of the Crown, but subsequently retained by the Commissioners at 15*s.* a day, to detect and prove the guilt of others, gave a very different account from that set up by Mr. Mottram. Mr. Cockburn freely called him "a perjured villain, who had had the barefaced effrontery to come into the court and tell the jury that he was kept by the Commissioners of Customs—fed by them on 15*s.* a day—and retained like a wild beast, ready to pounce upon any victim determined upon as being, in their caprice, to be devoured."—Lord Denman summed up the case, commenting with some severity upon the bearing of the evidence in proof of the guilty participation of the defendant Mottram, though with deepest indignation at the conduct of the man Burnby, whose evidence had been necessary to make out the case.—The jury retired for about two hours, and returned with a verdict of *Guilty* generally. Sentence stood deferred without observation.

COURT OF BANKRUPTCY.—*The Marylebone Bank in re David Hannay.*—The bankrupt in this case was the managing director of the Marylebone Bank, and the fiat against him was issued as far back as the 16th Nov., 1841. Since that period the case has been frequently before the court, and has excited considerable attention. The bankrupt passed his last examination on the 8th Feb., 1843, after repeated adjournments: and having subsequently applied for his certificate, a rehearing of the facts of the case took place. Sir C. F. Williams, the Commissioner, now proceeded to deliver the judgment of the Court to the following effect.—However beneficial to the public it may be that the Legislature has conferred upon the Commissioners of this Court the power of granting, withholding, or suspending the certificates of bankrupts, yet it is a very important—and sometimes a painful—duty that we have to perform. The situation which you, Mr. Hannay, held placed you under very important duties—not the less important to the public than to the bank; and if the public feel a deeper interest in any one establishment more than that of another, it is a bank, for the name of a bank ought to be clear and unsullied, and its integrity undoubted. After long inquiry, the main objects of

the opposition to you were, that you, as the manager, and afterwards a shareholder, and subsequently a director, were obliged to confess in this court, that you had not kept an ordinary or proper cash-book—a thing so essential, that no mitigating circumstance could excuse so gross a neglect of duty. It appears from the book you did keep, that 96,000*l.* was discounted in five years; but of that large sum neither the book, nor you yourself, have enabled the court or your creditors to know what portion was discounted upon your own account. Another objection is, that you, upon whom the shareholders relied, contracted a debt with the bank to the extent of 14,000*l.*, when you must have known that the bank could not have afforded to lend you a single shilling. From the very commencement of these transactions, nothing could have been more certain than the irresistible ruin of the bank. Under all these circumstances, as disclosed in this case, and painful as it is to me, I must, in discharging my conscience, and in justice to the commercial community, adjourn your certificate for two years, from the date of your having passed your last examination.

ASSIZE INTELLIGENCE.—HOME CIRCUIT.—HERTFORD.—*The Rev. James Brogden* surrendered to answer an indictment charging him with feloniously discharging a loaded gun at Cornelius Wintle, with intent to disfigure him or do him some bodily harm. The facts of this case have been already noticed in this Paper; and our readers will remember that the Rev. gentleman feeling some alarm, and imagining that thieves were upon the premises, had discharged the gun at a person whom he supposed intended to injure him either in his person or property. After several witnesses had been examined the Jury considered for a short time, when the foreman said they were unanimously of opinion that Mr. Brogden did not intend to shoot at any one when he fired the gun. Mr. Baron Alderson said he quite concurred in the opinion of the Jury, and then addressing Mr. Brogden said—"I hope, Mr. Brogden, you will be more careful in future; it was a very incautious act, but I entirely acquit you of an intention to injure any person." A verdict of Not Guilty was then returned.—CHELMSFORD.—*Michael Challis*, was indicted for feloniously setting fire to an outhouse, the property of Samuel Porter Matthews, at Harlow. The jury, after a short deliberation, returned a verdict of Guilty, and the prisoner was sentenced to be transported for 15 years.—*James Boreham*, *David Kempton*, *James Kempton*, and *Christopher Wright*, labourers, were charged with being feloniously on a close of land at Heron gate, near Brentwood, on the 4th Jan., armed with guns, for the purpose of taking game, and also assaulting the keepers. The jury found them all Guilty. James Kempton, who did not appear to have taken part in the assault on the keepers, was sentenced to 18 months' imprisonment and hard labour; the three others to be transported for 10 years.—*John Johnson* was found guilty of firing a stack of barley belonging to Mr. F. Richardson, at Wratness, and sentenced to 12 months' imprisonment, with hard labour.—*Thomas Moore* was found guilty of firing two stacks of hay belonging to Mr. M. W. Bird, Little Waltham, and sentenced to transportation for life.—*James Rampling* was tried for firing a bean-stack belonging to Mr. J. Page, at Foulness Island; but the evidence, though suspicious, was considered deficient, and he was therefore acquitted.—At the close of these trials for arson the Grand Jury and Lord Denman complimented the Essex constabulary for their efficiency in detecting the incendiaries.

OXFORD CIRCUIT.—ABINGDON.—*John Daris* and *William Jones* were charged with having unlawfully entered the land of the Earl of Abingdon at night, armed, for the purpose of destroying game, and with having assaulted one of his lordship's keepers, while endeavouring to apprehend them. The jury, after a lengthened discussion among themselves, found both Guilty, and they were sentenced to imprisonment with hard labour for six months.—OXFORD.—*John Downs*, and *Charles Wansell*, whose occupation is that of bowler to the Eton boys, were indicted for having on the 14th ult., at Windsor, feloniously assaulted and stolen from William Varney three sovereigns, his property. This case arose out of the riotous attack on the prosecutor in consequence of his having given evidence in some cases before the magistrates, the particulars of which have been already stated. The evidence did not sustain the charge of theft, and a verdict of Not Guilty was returned. They were again indicted for a riot and assault, arising out of the same affair, and found Guilty. Sentence, six weeks' imprisonment.

NORTHERN CIRCUIT.—NEWCASTLE.—*William Cranston* was indicted for having, on the 27th September last, at Morpeth, set fire to a hay-stack, the property of W. Woodman. The offence was fully proved, and the prisoner was sentenced to 20 years' transportation.—*James Carter*, the turnkey who was committed for having favoured the escape of Mr. Louis, as noticed in our Paper of Jan. 27, was tried, and acquitted for want of evidence.

CENTRAL CRIMINAL COURT.—*Custom-House Frauds.*—*Henry Jones*, a landing waiter in the Customs, was charged with misdemeanour arising out of the late frauds. He withdrew his plea of not guilty, and pleaded guilty to the charge. Sentence deferred.—*William Christie*, a Custom-House agent, was then charged with having defrauded the revenue in conjunction with the former prisoner, by passing a lot of Dutch clocks, containing a number considerably larger than that on which duty was paid, and with having made out bills charging the owner of the goods with more duty than he had paid into the Custom-House. The Jury found him guilty on the last count. Both prisoners were then charged with conspiracy to defraud the revenue. They both pleaded guilty, and Jones handed in a written confession. Mr. Justice Patteson said, it appeared from the confession of Jones that he had been induced by Christie, to whom he owed some money, to join him in executing those frauds. But still it should be recollected that he occupied a place of trust, and on carefully looking into the circumstances, it did not appear that there was any material difference between the guilt of the prisoners. The sentence upon them was, that they should be severally imprisoned and kept to hard labour for the term of one year. There was another indictment for conspiracy against the prisoners, with *James Christie*, but the Attorney-General entered a *nolle pros.*, and two other indictments, one for forgery and another for fraud, were also abandoned.—*Sarah Dickenson* was tried yesterday for the murder of her children at Deptford, the particulars of which have been already given, and acquitted on the ground of insanity.

POLICE.—MANSION HOUSE.—The examination of the four persons charged with being concerned in the Wills Forgeries were brought up for re-examination on Friday, and on the application of Mr. Barber's counsel they were again remanded for a fortnight, when the Lord Mayor is resolved to bring the case to an issue. It is stated that a clerk in the Bank has acknowledged that he had supplied the prisoner Fletcher with information from the Bank books as to the amounts and other particulars in every one of the cases on which the prisoners are to be committed. A douceur of a considerable amount was presented to him, and the Bank-note of which it consisted has been regularly traced. The Bank clerk is under suspension, and will be produced as a witness at the trial.

BIRTHS.—On the 27th ult., at Carnock-house, North Britain, the lady of J. OSBORNE, Esq., of a daughter—28th ult., in Lower Wherton-street, Pentonville, Mrs. T. KILNER, of a son—28th ult., at Ashwick-grove, the lady of R. STRACHEY, Esq., of a son—29th ult., at Hillingdon, Mrs. A. STILWELL, of a daughter—1st inst., at 74, Great Russell-street, the lady of the Rev. R. MORRIS, of a daughter—1st inst., at the Provost's Lodge, Eton Coll., the Hon. Mrs. HODGSON, of a son—4th inst., at 14, Curzon-street, the Hon. Mrs. G. HOPE, of a son—2d inst., the lady of F. MILDRED, Esq., of a son—2d inst., at Camberwell, Mrs. W. GIBBS, of a son—2d inst., at Aldborough lodge, Yorkshire, the lady of B. T. WOOD, Esq., of a daughter—3d inst., at 3, Regent-square, the lady of T. WALKER, Esq., of a daughter—4th inst., at Clapham, Mrs. T. HOWELL, of a daughter—4th inst., at 25, Torrington-square, the lady of E. H. FITZHERBERT, Esq., of a daughter.

MARRIED.—On the 28th ult., at Windermere Church, Bowness, Lieut. W. B. PONSONBY, of the Hon. East India Company, to Miss ANNE ELIZA, eldest daughter of Capt. D. J. Skelton, Esq., R.A., Rayrigg-hall, Windermere—29th ult., at St. Peter's, Hereford, H. O. ROBINSON, Esq., C.E., London, to ISABELLA HAMILTON, relict of the late E. C. Dansey, Esq., R.N., and eldest daughter of C. Walker, Esq., of Ashford Court, Shropshire—2d inst., at Stonehouse, F. J. POLKINGHORNE, First Lieutenant in the Royal Marines, to CHARLOTTE, youngest daughter of Matthew Wiggins, Esq., formerly of Gloucester-place, Portman-square—5th inst., at Littlebourne, W. PENNINGTON, Esq., to MARY ELIZABETH, eldest daughter of C. James, Esq., of Littlebourne Rectory, Kent, and formerly Captain in the Scots Greys—5th inst., at St. Paul's, Ball's Pond, Mr. R. HUNTER, to Miss THORNTON, of Brunswick place, Islington.

DIED.—On the 29th Jan., on his passage from Bahia to Lisbon, J. J. D. SILVA, Esq.—18th ult., at Paris, Major H. J. CLOSE, late of the 5th Dragoon Guards, aged 61—22d ult., the Rev. C. H. R. RODES, of Barlborough-hall, Derbyshire, aged 52—28th ult., T. YARD, Esq., of Bucklands, Ryde, Isle of Wight—29th ult., MARIA LOUISE, aged 8, and on the 5th inst., CHARLOTTE NIEMANN, aged 4 years and 8 months, the beloved daughters of Mr. J. C. Smith, of Hyde-vale, Blackheath—1st inst., at Southern-hill, near Reading, after a lingering illness, MARIA, widow of the Rev. J. C. Wright, and daughter of W. O. W. Ogle, Esq., of Causey-park, Northumberland—2d inst., at Bath-place, Peckham, after a lingering and severe illness, ELIZA MARGARET, the beloved wife of Captain T. A. Carr, aged 29—3d inst., MARY, widow of the late G. W. Prentice, Esq., and formerly relict of the late Major Leach, of the 30th Regiment of Foot, aged 60—4th inst., J. B. WOOD, Esq., of 6, Western-terrace, Brighton, aged 42—5th inst., at Buckden, in the county of Huntingdon, ANN, widow of Radcliffe Sidebottom, Esq., formerly of Sutton-court-house, near Chiswick, Middlesex, one of the Benchers of the Hon. Society of the Middle Temple—5th inst., at the residence of her son-in-law, No. 24, Finsbury-square, RACHEL NORSA, relict of the late M. Norsa, Esq., aged 87—5th inst., at his residence, Tonbridge-wells, Mr. J. BEYNON, late of Gracechurch-street, aged 66—5th inst., ANN, wife of S. Brandram, Esq., of Cumberland-terrace, Regent's park—5th inst., at Fairford, C. CROUCH, Esq., aged 72—5th inst., at Ruthin, J. ROBERTS, Esq., solicitor—5th inst., ELIZA MARIAN, eldest daughter of Mr. Maguire, the Vale, Chelsea—5th inst., at Croydon, MARY, the beloved wife of Henry Overton, brewer, aged 47—6th inst., H. LOWE, Esq., of Southampton-buildings, Chancery-lane, and North Cray, Kent, aged 44—Lately, DUNCAN GREGORY, Esq., M.A., of Trinity College, Cambridge—Thursday evening last, Sir F. W. DRUMMOND, of Hawthornden, Bart., which took place at his house, at Midfield, on Thursday evening last—4th inst., at Elcot, HENRY, eldest son of Mr. W. R. Whale, aged 33, being the fourth within a very short period.—26th Feb. THOMAS MORRIS, of Leytonstone, in his 48th year.

70, STRAND.

RAMS FOR RAISING WATER WITHOUT LABOUR, WHERE A FALL CAN BE OBTAINED,

FOUNTAINS of every description. Specimens of the Fountain to be seen at the above address.

Also a Ram fixed on the premises. F. ROE, 70, Strand, London.

Every kind of Garden and other Pumps, Well Engines, &c.

AGRICULTURE, COMMERCE, NAVIGATION, the CHURCH.—A. B. SAVORY and SONS, GOLDSMITHS, 14, Cornhill, London, opposite the Bank, have finished a few Splendid Pieces of PLATE, suitable for presentation to Gentlemen connected with either of the above pursuits or professions, to which they invite the attention of committees who are in search of valuable testimonials for such occasions.

MECHI'S ELEGANCIES for PRESENTS, manufactured on the Premises, 4, Leadenhall-street, near the India House, London, wholesale, retail, and for export. Ladies' and Gentlemen's Dressing-cases, in leather, wood, and papier maché, from 100 guineas each down to 25*s.* Writing-desks, 25 guineas down to 12*s.* Work-boxes, 20 guineas to 10*s.* Ladies' Cabinet and Jewel-cases assorted; Tea-caddies, the most elegant in the world, 12*l.* to 6*l.* each, down to 7*s.* 6*d.* Ladies' papier maché Work-boxes, 10*l.* each, down to 3*l.* Netting boxes, 30*s.* to 23*s.* Card-boxes, 5*l.* 5*s.* to 11*s.* Set of Tea-trays, 20 guineas to 5*l.* Bottle-cases, 30*s.* each. Companions, 2*l.* 10*s.* to 10*s.* 6*d.* each. Pole-screens, 9*l.* the pair. Hand-screens, 50*s.* to 20*s.* the pair. Card-racks, 40*s.* to 25*s.* per pair. Note and Cake-baskets, 50*s.* to 20*s.* each. Bagatelle-tables, 10*l.* 10*s.* to 3*l.* 10*s.* each. Leather Writing-cases, containing a complete Dressing Apparatus, 15*l.* 10*s.* to 5*l.* 10*s.* Pearl and Fancy Cardcases, 3*l.* 10*s.* to 10*s.* each. Ivory Hair-brushes, 4*l.* to 2*l.* 10*s.* per pair. Splendid Cases of Seven-day Razors, 10*l.* to 2*l.* 10*s.* the set. Ivory-handle and other highly-finished Strops from 25*s.* to 3*s.* each. Wharncliffe Penknives, Sporting Knives, and Fancy Scissors, 3*l.* to 5*s.* each. Splendid case of Agate, Pearl, and Ivory Dessert-knives and Table-knives, from 42*l.* to 4*l.* 4*s.* the case. A rich variety of Plate, Bronze, Gilt, and Papier-maché and Table-inkstands, from 6*l.* to 7*s.* 6*d.* each. The quality generally of Mechi's manufactures—the elegance of their display—and the rare combination of excellence and economy, with a very extensive choice of Stock—will amply repay the trouble of visiting his depôt, 4, Leadenhall-street.

TO LADIES.

ROWLAND'S KALYDOR.—This Royally Patronised and universally adopted Specific is a balmy, odoriferous, creamy Liquid, composed chiefly of extracts from the most rare Flowers and Herbs of an Eastern Clime. Its discovery was no less singular (by a Lady of rank), than its effects have been felicitous, during the last thirty years. It is the mildest and most efficacious preparation ever known for dissipating Tan, Pimples, Freckles, Discolorations, and other Disfigurements of the Skin. The radiant bloom it imparts to the Cheek, and the softness and delicacy it induces on the Hands, Arms, and Neck, render it indispensable to every Toilet.

Gentlemen will find it peculiarly grateful after shaving, in allaying irritation of the skin, and in rendering it soft and smooth.

Price 4*s.* 6*d.* and 8*s.* 6*d.* per Bottle, duty included.

CAUTION.—The great demand for this article excites the cupidity of *unprincipled Shopkeepers*, who vend the most *spurious trash* as the "GENUINE KALYDOR:"—whereas the genuine article is prepared solely by A. ROWLAND and SON, and the amalgamation of its *costly exotic* materials renders abortive any attempt to discover its component parts—thus proving the imposition of all other articles bearing the title of "KALYDOR." The genuine article has the words "ROWLAND'S KALYDOR" on the Wrapper.

*** All others are FRAUDULENT COUNTERFEITS!!!

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the Public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the Apparatus; and B. and H. can safely recommend it from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices, to 130, Fleet-street.

TWENTY YEARS' LOSS of HAIR, and WONDERFUL RESTORATION. Church-street, Whitby, Oct. 19, 1841.—Gentlemen—Of the last supply of OLDRIDGE'S BALM of COLUMBIA every bottle was sold immediately on receipt, and I have many more bespoke, only waiting for a further supply, which I hope you will send without the least delay. Orders have poured in more than ever since the powerful effects of the Balm have been so decisively demonstrated in the cases of several credible and respectable inhabitants of the town. One instance, among others which have attracted particular attention, is the case of a gentleman who had had little or no hair for 20 years; he had tried numerous preparations in vain, and ultimately had his head shaved and wore a wig. At my recommendation he tried the Balm; and after using it according to the directions for a short time, the young hair appeared, and he has now as fine a head of hair as any person in Whitby. Yours, &c., JOHN KILVINTON.

To Messrs. Kennaby, Brothers, 10, Westmoreland-buildings, Aldersgate-street, London.

OLDRIDGE'S BALM prevents the hair turning gray, produces a beautiful curl, frees it from scurf, and stops it from falling off; a few Bottles generally restore it again. Price 3*s.* 6*d.*, 6*s.*, and 11*s.* per Bottle. *No other prices are genuine.* Ask for OLDRIDGE'S BALM of COLUMBIA, 1, Wellington-street, Strand.

METCALFE'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most effectual and extraordinary manner, and is famous for the hairs not coming loose—1*s.* An improved Clothes Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh Brushes, of improved graduated and powerful friction. Velvet Brushes, which act in the most surprising and successful manner. The Genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE'S Sole Establishment, 130B, Oxford-street, one door from Holles-street.

Caution—Beware of the words "From Metcalfe's," adopted by some houses.

WANTED, a GARDENER.—A married Man, without children, will be preferred, for a situation in the country, where there is very little glass, and only plain Gardening. It is important that he should understand the management of woods, grass land, and cattle. Apply to B. S., Mr. ROLFE'S, 110, Leadenhall-street, by letter post-paid. No one need apply whose character for honesty, sobriety, and industry will not bear the strictest scrutiny.

WANT PLACES.—All Letters to be post-paid.

AS HEAD-GARDENER.—A single young Man who thoroughly understands his profession in all its various branches; can be well recommended from the gentleman he last lived with as Head-Gardener. No single-handed place will be accepted.—Direct to A. S., Post-office, Bexley, Kent.

AS HEAD GARDENER.—A single Man, aged 30, of persevering habits, and who has a thorough practical knowledge of his business in every department. Can produce an excellent family character. Address Secretary, Regent's Park, Gardeners' Mutual Instruction Society, 64, High-street, Marylebone.

AS PROPAGATOR or FOREMAN.—A young Man, who understands every department of the Nursery Business, and can produce a good character for abilities and general conduct; has no objection to any part of the country. Direct to A. B., Post-office, Kingsland-green.

AS GARDENER.—A single Man in prime of life, who is well experienced in all the branches of his profession, and can be highly recommended.—Direct to T. P., Post-office, West Wickham, near Bromley, Kent.

AS GARDENER.—A respectable single Man aged 33, with an unexceptionable character, who is practically conversant with the most approved system of Horticulture and general routine of gardening in all its branches, having had great experience in Forcing Fruits and Flowers of every description; no objection to any part of the country.—Direct to A. L., Post-office, Great Staughton, Hunts.

AS GARDENER.—A middle-aged married Man without family, of respectable habits, who is well experienced in the cultivation of Pines and Vines, and Early Forcing in general; could take the management of a Hot-house and Greenhouse; he has also had good experience in the cultivation and propagation of plants. Can have 2 years' unexceptionable character; and has no objection to any part of the country.—Direct to G. D. A., at Mr. Veller's, Greengrocer, Brewer's-buildings, Wandsworth-road, Surrey.

AS GARDENER.—A Gentleman wishes to obtain a situation for his Gardener who is about to leave him in consequence of some alteration in his establishment. He is fully competent to undertake a first-rate situation as Gardener, and could take the management of a few acres of land if required—Wages, 24*s.* per week; or, 20*s.* with house, firing, and vegetables.—Direct to E. G., at Mr. C. H. Jessop's, Nurseryman, Cheltenham; or at Messrs. Garroway, Mayes, and Co.'s, Durdham-down Nursery, Bristol.

AS GARDENER, a middle-aged married Man, without encumbrance, who understands growing of Pines, Grapes, Greenhouse Plants, with a practical knowledge of his business. Can have a good character from his last place. Direct to A. B., Mr. Hopkins's, Leyton, Essex.

AS GARDENER.—An active Man, aged 35, of respectable habits, and well experienced in all the superior branches of Gardening; has a good practical knowledge of Plants, Flower-gardening, &c., and is capable of taking the management of Woods, Plantations, Ground-work, &c., or a small Farm, if required. His character will bear the strictest investigation. Terms will not be extravagant.—Direct to S. H., at Mr. PAMPLIN'S Nursery, Hornsey-road, Holloway.

AS GARDENER.—A young Man aged 22, who understands the general management of Flower and Kitchen-gardens; can have a good character from his late employer.—Direct to J. T., Stillingfleet, near York.

AS GARDENER.—A single Man from the country, aged 30. He can take charge of a small Farm if required, where one or more Assistants are kept. He can have 12 months' good character from his last place.—Direct to J. H., Mrs. Curtin's, Kew Green, Surrey.

AS GARDENER.—A married Man, aged 31, who perfectly understands his business, likewise meadow-land and stock, and can be well recommended by the Gentleman he is now leaving.—Direct to H. R. S. Escudian, Esq., Garvetts House, Banstead, Surrey.

AS GARDENER.—A single Man, aged 36, who perfectly understands his business in Hothouse, Greenhouse, Flower Garden, and Kitchen Garden; can have five years' character from his last place.—Direct to J. F., at R. Weldham, Baker, opposite the Goat and Boots, Little Chelsea.

GARDENERS' BENEVOLENT INSTITUTION.—Notice is hereby given, that an Election for three Pensioners on the Funds of this Charity will take place in June next. All persons desirous of becoming Candidates, are requested to forward their testimonials and certificates to the Secretary on or before the 28th inst. (after which time they will not be received), and of whom printed forms of application may be had.

By Order, EDWD. R. CUTLER, Secretary, 97, Farringdon-st.

ENTOMOLOGICAL SOCIETY OF LONDON.—PRIZE ESSAYS.—A Prize of 5*l.* has been offered by the Rev. F. W. HOPE, F.R.S., for the best Essay on the Natural History, Habits, and Peculiar Properties of VESICATORY INSECTS, with reference chiefly to their practical utility, an account of all species hitherto employed as Vesicants, their relative value in respect to the quantity of Cantharidin they contain, and notices of the Monographs and other Works in which their properties are described. The Essays to be delivered at the Society's Rooms, 170, Old Bond-street, London, addressed to the President, with a sealed letter and motto, on or before the 2d Dec., 1844. A second Prize of 5*l.* has also been offered by the Rev. F. W. HOPE, for the best Memoir on the Natural History of STYLOPS, to be drawn up from personal observation, with especial reference to the distinction of the sexes, mode of propagation, and early states of the insects of that genus. TRANSACTIONS, &c. Price 6*s.* 6*d.* PROCEEDINGS, Part V., and the last ANNIVERSARY ADDRESS, delivered by the President, are also ready for delivery. London: LONGMAN and Co.; and BAILLIERE.

GRAND CARNATION and PICOTEE SHOW, at the COPPICE, near NOTTINGHAM, on TUESDAY, AUGUST 6, 1844, open to all England.—Two Silver Cups, value Five Guineas each, will be presented by I. F. WOOD, Nurseryman and Florist; one for the best stand of 10 dissimilar Carnations, consisting of two Scarlet Bizarres, two Crimson Bizarres, two Scarlet Flakes, two Purple Flakes, and two Rose Flakes. Also, one for the best stand of 10 dissimilar Picotees—two Heavy and two Light-edged Red, two Heavy and two Light-edged Purple, and one Heavy and one Light-edged Rose.

Conditions of Exhibition.—1. Entrance, 5*s.* to each Cup, which sums will be apportioned by the committee in numerous other prizes; also a certain sum will be given for the best seedling in each class. 2. No seedlings to be exhibited in any pans for the cups. 3. The Flowers to be staged by 12 o'clock in the forenoon—none admitted after that period. 4. All Flowers must be *bonâ fide* the growing and property of each Exhibitor for two months previous to the day of show, and bloomed in his own garden. Each Exhibitor must sign a declaration to this effect, previous to staging. 5. All Flowers exhibited must be labelled and properly named. 6. The Subscriptions to each Cup must be paid, either in cash or post order, to Mr. G. I. ROBINSON, Office, 4, Ram Inn Yard, Long Row, Nottingham, Honorary Secretary to the Committee, on or before the last day of April next.

EUCHARIDIUM GRANDIFLORUM—A SPLENDID NEW HARDY ANNUAL.

WILLIAM MAY begs to offer the above new and beautiful Annual for the first time, seeds of which were kindly presented to him in 1842 by Capt. Widdrington, R.N., who introduced it from the Royal Botanic Garden of St. Petersburg. It is twice the size of E. concinnum, of a brilliant dark rosy red, and very appropriate for masses or beds, blooming most part of the summer, and is decidedly one of the best of annuals in cultivation. May be had in packets, at 2*s.* 6*d.* each, Post-paid.

WILLIAM MAY, Hope Nursery, Leeming-lane, Bedale, Yorkshire.

SEEDLING VERBENAS.

E. H. FULLER respectfully informs the Public that he intends sending out in April the following new and distinct Varieties of VERBENAS, which have been universally admired, and submitted to Dr. LINDLEY.—Vide *Gardeners' Chronicle*, Oct. 14, 1843, page 721.

E. H. FULLER, No. 2, (INCOMPARABLE), "brilliant rich purple, with a white eye, the best of its colour we have seen."—Plants in April, 5*s.* each.

No. 3, LUCASII, "delicate pink, clear and good."—2*s.* 6*d.* each.

No. 4, LOUIS-PHILIPPE, rosy-purple, clear and steady in colour, a good Variety."—Plants 3*s.* 6*d.* each.

"These flowers are characterised by having the colours very clean, not dirty nor uncertain, as it frequently happens. The flowers are rather small, but this may arise from want of better cultivation."

The usual trade allowance if three or more Plants are ordered. All Orders will be sent post-free, or by coach, paid to London. A Catalogue of Fuchsias, Geraniums, &c., &c., will be forwarded by post on application.—Worthing, March 14, 1844.

FLORIST TO HER MAJESTY THE QUEEN.

"PETUNIA PUNCTATA."

WILLIAM MILLER, in bringing this extraordinary and beautiful production into public notice, does so without the slightest diffidence, being fully assured of its giving the most entire satisfaction. It is of a dwarf habit, and dark green foliage. The reason it was not exhibited at the London Shows was its not flowering till October. It has been submitted three times to Dr. LINDLEY, whose opinion will be found as follows (pages 721, 774, 777)—"M. R.: Your Seedling, No. 25, is quite a novelty; it is a beautiful, distinct, and desirable variety; the colour is a soft, decided blue, mottled with white, and spotted with Rose; these gradually disappear, and leave the flower a beautiful blue mottled with white; in this state the flower dies; it will be an acceptable addition to this beautiful class."

Plants have already been ordered for the QUEEN's Garden, Claremont; plants in April at 7*s.* 6*d.* each, including case and postage; the usual allowance to the Trade when three or more are taken at once.

W. M. has also two Splendid Seedling Verbenas.

"BLUE QUEEN," and "ZEUXES."

"BLUE QUEEN," the best blue Verbena yet out (see Dr. LINDLEY's opinion in *Gardeners' Chronicle*, July 15, page 721)—"M. R.: Your Sweet-scented Seedling, No. 105, is the best we have seen of its colour—bright blue Lilac; the flower is large, smooth, glossy, and perfectly free from crumples." Price per plant, 5*s.*

"ZEUXES," beautiful novel Rosy vermilion, with large light eye (see Dr. LINDLEY's opinion in *Gardeners' Chronicle*, September 30, page 681)—"*J. Miller:* Your Seedling named Zeuxes is large and very brilliant." Price per plant, 3*s.* 6*d.*: plants in April; the usual allowance when three or more are taken at once.

W. M. has plants of rich coloured scarlet Geranium, "Fireball," now ready, at 5*s.* each, post free.

N.B.—The above new plants may also be had of the following Agents:—Warner and Warner, 28, Cornhill; Hurst and MacMullen, Leadenhall-street; Noble and Sons, 152, Fleet-street; Flanagan and Sons, 9, Mansion-house-street; Kernan, Seedsman, Great Russell-street, Covent Garden; and Corsten, Seedsman, St. James's-street, Covent Garden.

Plants can be sent post free, or in pots, as requested. A remittance requested from unknown correspondents. PROVIDENCE NURSERY, Ramsgate, March 12th, 1844.

DILLISTONE'S APPLE, the STURMER PIPPIN.—From the satisfaction given last season by the mode of transmitting by post scions of the above most valuable Apple, to distant parts of England, Scotland, and Ireland, S. & J. DILLISTONE are again induced to offer it in packets (true from the original tree), post-free upon receipt of a Post-office order, payable at Halstead, for 3*s.* 6*d.*, or the amount in stamps.

The Editor of the *Gardeners' Chronicle*, in "Notices to Correspondents," Nov. 25, 1843, says—"The Sturmer Pippin deserves the character given of it."

Mr. RIVERS, in the Supplement to his Fruit Catalogue, says—"The Sturmer Pippin again deserves noticing, for its excellent qualities; it seems to grow and bear well in all soils and situations, and will supply the desert or kitchen from March till July. It can be grafted with success till middle of May."

A choice Collection of Roses, Dahlias, Pansies, &c. &c. Nursery Stock in general.—Sturmer Nurseries, March 11, 1844.

DAHLIAS.

J. KEYNES, FLORIST, Salisbury.—"STANDARD OF PERFECTION," (Keynes).—The finest self-coloured Dahlia in the World! gained the 1st class prizes at Stonehenge, Windsor, Kingston, Surrey Zoological Gardens, and Crown and Anchor, Stockwell; also the 1st prize specimen at Stonehenge Floricultural Society, Stockwell. "It is as round as any Dahlia in cultivation; as complete an unbroken circle as could be drawn with the compasses; and as globular in front as possible. It is symmetrical to a hair, and as double as a Ranunculus. It is so remarkable as to be instantly recognised among a thousand. Colour, deep crimson. It is the flower of the season, and must be had."—*Gardeners' Gazette*, Oct. 14. "The best-grown flower we ever saw, without exception, every requisite to meet the taste of a connoisseur being complied with; good colour, a honeycomb, regularity of growth and disposition in the leaves, and above all, as complete a rotundity of shape as if it had been cast in a mould."—*Salisbury Herald*, Sept. 2, 1843. Plants in May, 1844, 10*s.* 6*d.* "Orange Superb," (Dodd's) first-rate show-flower, 10*s.* 6*d.* "The specimen sent would grace any stand."—*Glenny.* "Emma Noke," (Dowding's) bluish white, extra fine, indispensable to a first-rate stand, 10*s.* 6*d.* Catalogues containing all the fine old varieties and new flowers for the season may be had on application. Salisbury, March 15, 1844.

WILLIAM MASTERS begs to call the attention of the Nobility, Gentry, &c., to his newly and well assorted COLLECTION OF GARDEN AND FLOWER SEEDS, which being principally grown under his immediate inspection, he can particularly recommend.

100 papers finest Annual Flower Seeds			24*s.* 0*d.*
50	do.	do.	12 6
25	do.	do.	6 6

[If the selection is left to W. M.]

Forwarded by Post without additional charge. POTTER'S ARTIFICIAL GUANO and CONCENTRATED LIQUID GUANO.

Exotic Nursery, Canterbury, March 1844.

RANUNCULUSES, ANEMONES, PELARGONIUMS, AURICULAS, CARNATIONS, AND LILIUM LANCIFOLIUM.

H. GROOM, Clapham Rise, near London (removed from Walworth), by APPOINTMENT FLORIST TO HER MAJESTY, begs to inform the Nobility, Gentry, and Amateurs, that, in consequence of the success he has had in the cultivation of the above flowers at his new Garden, he can offer them at very moderate prices. He would particularly recommend an early application to be made for RANUNCULUSES and ANEMONES, as they should not be planted later than the end of March to ensure a good bloom. His Catalogue of PELARGONIUMS, AURICULAS, and NEW PLANTS, is now ready, and will be forwarded by post on application. The Trade supplied.

SEEDLING FUCHSIAS.

W. PAWLEY, of the White Hart Hotel, Bromley, Kent, begs to inform the Nobility and Gentry that he has purchased the entire Stock of three splendid Fuchsias, which he intends sending out in April next, at 10*s.* 6*d.* per plant. They are considered by competent and practical men to be the best known, and twice the size of any yet in cultivation.

QUEEN.—A large Flower, a very free bloomer, and of good habits. Colour, a delicate light Pink, and a beautiful Rosy Vermilion Corolla.

PRINCE OF WALES.—A very large bold Flower, and good substance. Colour, a bright Crimson, with an extraordinary large Violet Corolla. Magnet is also a large long Flower, good substance, habit, and a free bloomer.

To prevent disappointment, which is too often the case with new Flowers, the public are requested to come and see them before purchasing. Early orders are solicited, as the stock is limited, having broke very sparingly. A specimen of each will be open to any three Seedlings of 1843, grown from young plants, for the sum of 5*l.* To be exhibited at the West Kent Exhibition, held at Blackheath, in June next. N.B.—If accepted, notice to be given this month.—Bromley, March 12, 1844.

FUCHSIA.—MARNOCK'S PRINCESS SOPHIA.—This beautiful FUCHSIA, which was raised by an Amateur, and purchased by Messrs. MARNOCK and MANLEY, is a dazzling vermilion; thick, glossy, substance; large tube, and, excessively brilliant; corolla, dark purplish rose, well expanding and forming a beautiful contrast from the sepals. Plants in April, 10*s.* 6*d.* each; an allowance to the trade if three or more plants are taken at a time. Their Catalogue of Fuchsias, Verbenas, Cinerarias, &c., containing every variety worthy of cultivation, with many new varieties of Cinerarias, &c., not yet let out, is in the Press, and will be ready in a few days, and may be had on application at their Nursery, Hackney, near London.

N.B.—Every description of choice Flower-seeds, at advertised prices.—March 13, 1844.

NEW DAHLIAS.—SPARY'S "LADY ANTROBUS" and "AURANTIA."

E. SPARY begs respectfully to call the attention of Florists and Amateurs to the above new and distinct Seedlings, which have received prizes at the following first-rate Exhibitions, viz.:—Salthill (1st), Portsea, Salisbury Plain, Chippenham, London Floricultural Society, Stockwell, Surrey, &c. For description, notices of the Press, &c., vide *Gardeners' Gazette*, 4th Nov., *Gardeners' Chronicle*, 11th Nov., also the November Number of the "Gardener and Practical Florist," for Mr. Glenny's opinion. As the number of dry roots would not allow all orders to be executed, strong healthy plants will be sent out by the first week in May. Lady Antrobus, 10*s.* 6*d.*, Aurantia, 7*s.* 6*d*, with the usual discount per dozen. Also the select new and old varieties, at Catalogue prices.—Hungerford, March 12.

FUCHSIA AND DAHLIAS.

J. JONES, Florist, Ackworth, near Wakefield.—FUCHSIA BELLISSIMA is a delicate and pretty variety, of moderate size, Tube light-pink, Sepals tipped with green, and expanding freely, showing a well-formed Corolla, of a deep rose colour, which forms a good contrast to the other parts of the Flower; it appears to be of good habit, blooming freely.—See Dr. LINDLEY's opinion, Nov. 25, 1843.

DAHLIAS.—DILECTUS (JONES's), good form, dark purple, height, 4ft., 7*s.* 6*d.*

IMPERATOR (JONES's), fine crimson, scarlet, well up in the eye, fine form, 4ft., Plants, 5*s.*

ZECHIN (JONES's), dark velvetty-maroon, good form, rather coarse in the petals, 5ft., Plants, 5*s.*

DYSON'S VANQUISHER—fine rose, good size and form; has taken several first Prizes, height, 5ft., Plants, 7*s.* 6*d.*

J. J.'s list of Dahlias, Geraniums, Fuchsias, &c., containing a full description of the above, may be had on application.

CHARLES DALY & SON, NURSERY & SEEDSMEN, Coleraine, beg to inform the Trade that they have a quantity of One-year Seedling Thorns, at 1*s.* 6*d.* per 1000. Also upright Irish Yews, 1 to 1½ ft., at 4*d.* each. Bays, 3 years in pots, 25*s.* per 100. Portugal Laurels, good Plants, at 6*s.* per 100. Laurels, 1½ to 2ft., 20*s.* per 1000. Some Hollyberries, at 5*s.* 6*d.* per bushel. Also a quantity of fine Pine-apple Plants, fruiting and successive, warranted clean, from 1*s.* to 3*s.* each, delivered free in Glasgow, Fleetwood, and Liverpool.

TRUE HIGHLAND PINE.

JAMES GRIGOR begs to announce to the Land Proprietors of England, that he has received a supply of the true HIGHLAND PINE PLANTS, raised from Seeds collected on the Mountains of Strathspey, in the North of Scotland, where the tree is indigenous. These plants are of the variety so highly prized for producing hard and durable timber, known as the *Red Deal*, and formed part of the stock for which Mr. JOHN GRIGOR was awarded the Premiums of the Highland and Agricultural Society of Scotland. It has been also strongly recommended by Sir Walter Scott, Mr. Don, of Forfar, and others, as far preferable to the common Scotch Pine, both as to the quality of its timber, and as a picturesque object. It will grow on almost all soils—clay, peat, sand, gravel, and even chalk—so that it is peculiarly fitted for all waste lands. It is worthy of a place, too, as an ornamental tree, for in old age it assumes much of the bold and contorted figure of the Oak. To the Landscape Gardener, who has to clothe the bold declivities of distant scenes, it is invaluable; and, indeed, whether viewed as an ornament, or simply as a forest tree to be cut down for railway sleepers, or blocks for wood pavement, or with regard to civil architecture generally, it is without a rival among the trees of Britain. Two-year-old picked plants, carefully packed, at 2*s.* 6*d.* per hundred. If taken in thousands, a considerable abatement will be made in price.

Old Lahenham, Norwich, March 15, 1844.

NEW HARDY ANNUAL.

VISCARIA OCULATA—DARK-EYED VISCARIA.

T. AND J. BACKHOUSE, NURSERY AND SEEDSMEN, York, have the pleasure of offering to the Public the above new and beautiful Annual, which is figured at page 53, (No. 10), of the "Botanical Register" for 1843. The blossoms are of a bright rose-colour, with a deep crimson eye, and changing to a pale purple. It flowers very abundantly through the greater part of the summer and autumn. It is a native of Algiers, and may be sown either in the open ground in spring, or raised on pots and planted out.

Packets, 2*s.* 6*d.* each, will be sent, on the receipt of a Post-office order, postage free, to any part of the Kingdom.

SLOUGH NURSERY, NEAR WINDSOR,
CHOICE SELECTION OF NEW DAHLIAS, 1844.

THOMAS BROWN directs attention to his beautiful SEEDLINGS, particularly that unrivalled light flower, "Lady St. Maur," the superiority of which over every other of its class is too well known to need further comment. Strong and healthy plants will be ready for delivery early in May.

Aurantia (Spary's)—Orange buff; fine form and petal. A very desirable show flower; obtained numerous prizes; 3 ft.	10s	6d
Alexander (Brown's)—Maroon and crimson mottled; full and constant, centre well up, and a very useful show flower; 5 ft.	7	6
Delight (Brown's)—Cream, veined and tipped with purple; petal of fine substance and high centre; very distinct to any in cultivation; 4 ft.	7	6
Desirable (Brown's)—Shaded buff, quite new in colour; a good show flower; 5 ft.	7	6
Lady St. Maur (Brown's)—White, delicately tipped with violet purple; very deep and full, high centre, forming a beautiful outline; the petals are round, and smooth at the edge; habit of Perpetual Grand: it is decidedly the finest light flower ever offered. It attracted great admiration at Windsor, and was universally acknowledged to be the finest flower in the Exhibition; 4 to 5 ft.	10	6
Nutwith (Brown's)—Bright crimson; a fine open-cupped petal, and a good show flower; 4 ft.	7	6
Raphael (Brown's)—Dark maroon, beautifully shaded with light crimson; superior petal, of excellent form: a very novel and striking variety, and will be an acquisition to any stand; 4 ft.	10	6
Rembrandt (Brown's)—Dark purple, very round and double, rising well in the centre, and a constant show flower. It was very successfully exhibited; 3 to 4 ft.	10	6
Emma Nuke (Dowding's)—Blush white, good general form and centre: a good useful show flower; 4 ft.	10	6
Essex Bride (Turville's)—Delicate peach lilac, of excellent petal and form; 5 ft. (*no discount*)	10	6
Lady Antrobus (Spary's)—White and lilac, mottled; good form, constant, and very useful show flower; 3 ft.	10	6
Nonpareil (Proctor's)—Ruby scarlet, of first-rate properties; extra show flower; 4 ft. (*no discount*)	10	6
Standard of Perfection (Keynes')—Crimson; of very superior form; 4 ft. (*no discount*)	10	6
Sir J. Stewart Richardson (Union)—Brown ruby, great depth, and excellent show flower; 4 ft. (*no discount*)	10	6

T. B. has also Selections of fine Carnations, Picotees, and all other Florists' Flowers; Plants, Fruit-trees, Shrubs, and general Nursery Stock.

A general Catalogue of Dahlias, with a List of Superb New Pansies, to be had on application.

NEWEST, CHEAPEST, AND VERY BEST
FUCHSIAS AND VERBENAS.

Fuchsias.—12 fine choice distinct sorts, for . 7s. 6d.
12 extra very superior, selected from all new kinds sent out last season for the first time, for . 15 0

Such as Exoniensis, Enchantress, Ballooniflora, Toddiana, Eppsii, Cormackii, Dennisiana, Prince Albert, Laneii, Frostii, Grenvillii, Fairy Queen (Bell's), Iveryana, Gem (Ivery's), Nobilissima (Smith's), Majestica (Smith's), Defiance (Smith's), Robusta (Smith's), Stanwelliana, Transparens (Youell's), Deansii (Dean's,) Recurva (Dean's), Alice Maude Mary (Bell's), Princess Royal (Bell's), Brockmanii, Prince of Wales (Bell's), Lowryii, &c.

Verbenas.—12 fine distinct varieties, for . . 3s. 6d.
" 12 extra and very superior, for . . 6 0

Such as Duke of Cornwall (Knight's), Speciosa (Kyle's), Princess Royal (Youell's), Howardiana (Low's), Prince of Wales (Wood's), Cærulea (Harrison's), Boule-de-Fue (Girling's), Tweediana picta, Minstrel Boy (Girling's), Rosy Queen (Halley's), &c. &c. &c.

Purchasers are requested to send the names of those kinds they already possess; and Mr. Miller pledges to send them entirely different, and sorts such as will add beauty as well as novelty to their collections. Mr. M. is enabled to do this satisfactorily, having bloomed every new kind sent out last season. —See extensive list in this Paper of Feb. 17, 1844.

100 fine Hybridised Fuchsia Seeds, 7s. 6d.; fifty, 4s.; Geranium Fireball, 5s.; Black Nemophylla discoidalis (plants) 1s. each.

The above will be sent post free, packed in stout tin cases, so as to warrant their arrival to any part in safety; or may be had in pots, carriage paid to London, and no charge for packing or hamper.—W. Miller, Providence Nursery, Ramsgate, Mar. 15.

SPLENDID SEEDLING FUCHSIAS, PANSY, and AQUILEGIA.

W. ROGERS and SON, Seedsmen and Florists, beg to offer the following, which they can with the greatest confidence recommend.

SEEDLING FUCHSIAS.

No. 1, ROGERS'S UTTOXETER BEAUTY.—"*W. R. & Son.*—Your seedling is a flower of good substance; tube and sepals of a bright rosy red, corolla purple vermilion, pistil very long and stout; *a very large and showy variety.*"—*Gardeners' Chronicle*, August 5, 1843. Plants 10s. 6d. each.

No. 2, ROGERS'S UTTOXETER RIVAL.—"*W. R. & Son.*—In the seedling now sent the tube is stout, with sepals of a rosy carmine, broad and tipped with green; they expand freely, showing the corolla, which is of a rosy purple. *This is a very large and bold flower.*"—*Gardeners' Chronicle*, August 19, 1843. Plants 10s. 6d. each.

No. 3, ROGERS'S PENDULA ELEGANS.—"Stout tube and sepals, which are broad and slightly tipped with green, which expand freely; corolla shaded purple."—*Harrison's Floricultural Cabinet*, August 1843. A very good one. Plants, 5s. each.

In addition to the above opinions, W. R. & Son beg to state No. 1 is a variety of immense size and substance; the colour has a very rich glossy appearance, while the extraordinary length of the pistil forms one of the most distinct and splendid kinds ever offered. A fine plant was exhibited at the Uttoxeter Royal Horticultural Society, with branches extending from the main stem 12 to 18 inches, in full bloom, which shows it to be a free bloomer, and not merely blooming at the ends of the branches. It gained the first prize, and was much admired. The same remarks are applicable to No. 2, except that this gained the first prize for the best seedling, and allowed by the judges to be a superior variety. No. 3 is a fine variety, and very free bloomer; gained the first prize at the Lichfield Horticultural Society.

FUCHSIA ROGERSIANA, 2s. 6d. each.

The usual discount to the Trade on the above, when not less than six plants are ordered at one time, and on the following when not less than three are ordered.

PANSY—ROGERS'S LORD VERNON.—Upper petals crimson purple, lower petals laced with same, centre pale yellow, with an extremely large eye; this is of immense size and good form; a very distinct and fine sort. Plants 5s. each.

AQUILEGIA GRANDIFLORA.—This is a beautiful plant (a hybrid), flowers the colour of A. glandulosa, but twice the size. It has been several times exhibited at the Uttoxeter Royal Horticultural Society, and invariably won the first prize for Herbaceous plants, and particularly admired by all who saw it. Plants 5s. each.

Strong plants of the above will be ready to send out by post or otherwise the first week in April. A reference or remittance requested from unknown correspondents.

W. R. & Son's Catalogue of Dahlias, Pansies, Phloxes, Pelargoniums, Cinerarias, Verbenas, &c. &c., including many new varieties, may be had prepaid, on a prepaid application.

Agents for the above, Messrs. Hurst and McMullen, Seedsmen, 6, Leadenhall-st., London.—Uttoxeter, Staffordshire, Mar. 11.

GENUINE BEECHWOOD MELON SEED.

R. GLENDINNING respectfully begs to inform the Cultivators of the MELON that he has had presented to him by Sir John S. Sebright, Bart., Seeds of the *true* variety of his delicious MELON; for besides being one of the very best sorts known, it is of easy cultivation and a good bearer. This opportunity will enable gentlemen to procure it *quite genuine*, which is rarely the case, as the following note will testify:—

"Beechwood, Feb. 5, 1844.

"Sir,—I send you a small parcel of the Beechwood Melon Seed. None that I have seen exhibited under that name, nor any that I have seen grown from Seed that has been bought, are of the true sort, but have obviously been intermixed with other varieties. I have grown no other for many years.

"Your obedient servant,
J. S. Sebright."

"To Mr. Glendinning.

R. G. has also a few Seeds of the true SION FREE-BEARING CUCUMBER, a splendid variety which has been nearly lost.

Packets of the above sent by post free.
Beechwood Melon per packet . . . 5s.
Sion Free-bearing Cucumber per packet . 5s.

R. G.'s Kitchen-garden and Flower-seeds have been selected with great care, and embrace all the new and good kinds.

Chiswick Nursery, near London, Feb. 16, 1844.

CHOICE PANSIES.

J. HENCHMAN begs to inform cultivators of the PANSY that he is now sending out healthy plants of six good seedling varieties, for 21s. the set. Also a few choice kinds at 15s. and 18s. per dozen.—Edmonton, March 1844.

NEW CAMELLIAS, FUCHSIAS, and CINERARIA.

J. HALLY, Nurseryman and Florist, Blackheath, begs to offer for sale the following SEEDLING CAMELLIAS, which have been highly approved of by all who have seen them:

PULCHELLA ROSEA.—Figured and described in the "Florist's Journal" for July last; a finely formed delicate rose-coloured Flower, perfect in shape, rising well up in the centre. Good Plants, each, 3l. 3s.

ALBA MULTIFLORA.—Colour very pure white, with sometimes a delicate pink stripe; petals thick, cupped, and round. The chief novelty and merit of this variety consists in the abundance with which it blossoms, the flowers appearing at every joint throughout the young wood, so as when in bloom to give the plant the appearance of bearing racemes of flowers. Strong plants, 1l. 11s. 6d.

J. Hally can confidently recommend the following 6 SEEDLING FUCHSIAS, which he intends sending out early in April; they are all very distinct and beautiful varieties.

1. SANGUINIVEA.—Tube and sepals clear delicate white, with crimson corolla; of excellent close habit. This very distinct variety gained the seedling prize at the West Kent Floricultural Exhibition, Sept. 6, 1843. For its character see *Gardeners' Gazette*, Sept. 9th, in the account of the said exhibition, described as shown by Mr. Branscombe. Price 7s. 6d.

2. FAIR HELEN.—Tube and sepals white, corolla scarlet; a very neat Flower, of good habit, exhibited at the Surrey Zoological Gardens, at the September show, and universally admired. 5s.

3. BOYDII.—Fine thick scarlet tube and sepals, corolla large and bright crimson; of bold habit. 5s.

4. WAT TYLER.—Tube and sepals very large, light rose; corolla large and scarlet. A large flower, and most abundant bloomer. 5s.

5. KING JOHN.—Habit of plant and colour of flower like Chandlerii, but twice the strength and size. A noble variety. 5s.

6. MARGINATA.—Very large flower; tube and sepals scarlet, corolla (large and expanding well) crimson, having a scarlet margin round each petal. Plant of particular fine habit. 5s.

The above collection of Fuchsias may be had, by taking the whole, for 30s. The usual allowance to the trade on the above.

Also will be ready for delivery at the same time with the Fuchsias, PIPER'S "PRINCESS ROYAL" CINERARIA (not yet sent out). This beautiful variety obtained the seedling Certificate at Chiswick, and first prize at the Regent's Park last season. Price 7s. 6d. each, with the usual allowance to the trade, when four plants or more are taken.

A general Collection of Camellias, Fuchsias, Azaleas, Ericas, Cinerarias, &c. Veronica speciosa, 21s. each; Rosa Devoniensis, from 18s. per dozen.

WM. JOHN CORMACK, Agricultural Seedsman by Appointment to His Royal Highness Prince Albert, New Cross, Surrey, and Bedford Conservatory, Covent Garden, begs to call the attention of the Nobility, Gentry, and Agriculturists in general to his combinations of GRASS SEEDS for Permanent Pasture, the Alternate Husbandry, Parks, Lawns, &c. (as recommended and practised by his partner, the late Mr. George Sinclair, Author of the "Hortus Gramineus Woburnensis.") Upwards of 2500 acres have been converted to permanent pasture by this establishment with the greatest success. Parties requiring Seeds are respectfully requested to state the nature of the soils. Mangold Wurtzel, Carrot, and Turnip-seed of excellent sorts, saved from transplanted bulbs. Garden and Agricultural Seeds of the best quality and most approved kinds.

N.B.—Cormack's British Queen and Prince Albert Peas, at 3s. 6d. per quart.

AGRICULTURAL SEEDS.

WHITE BELGIUM GREEN-TOP CARROT, 1s. per lb.; Altringham Carrot, 1s. per lb.; Large Green-top Orange Carrot, very thick shouldered, and well adapted for shallow soils, 1s. 6d. per lb.; Long Red Mangel Wurzel, grows well out of the ground, 1s. per lb.; Fine long Yellow Mangel, produces roots as large as the red, 1s. 6d. per lb.; Yellow Globe Mangel, 1s. per lb.; Lucerne, 1s. per lb.; Italian Rye-Grass, 8s. per bushel; Pasture Grasses of all kinds, fine mixed Grasses for Lawns; Skirving's Improved Swede Turnip, 1s. per lb.; Laing's do. 1s. per lb.—W. J. Nutting, Seedsman, 46, Cheapside, London.

Garden and Flower Seeds of every kind, as advertised by other houses.

GREEN GLOBE TURNIP SEED.—A Grower of Turnip Seed has 150 bushels of fine Green Globe Turnip Seed. Samples and price sent to order by applying to W. Stent, Nurseryman, Stockwith, near Gainsborough.

SEEDS.—Belgium Large White Carrot, 1s. per lb.; Mangold Wurtzel, Long Red, Orange Globe, and Red Globe, 1s. per lb. each; Le Couteur's Belle Vue Talavera Wheat, 11s. per bushel; Kintbury Skinless Barley, 8s. 6d. per bushel; Meadow and Pasture Grass Seeds in Mixtures, suited to soils, &c., at 32s. per acre; Mixed Sorts for improving old Grass Land, 1s. 3d. per lb.; Fine Sorts for forming Lawns, &c., 1s. 4d. per lb. Price Catalogues of Turnips and other Seeds are ready. Kitchen Garden and Flower Seeds.—George Gibbs and Co., Seedsmen, &c. to the Agri. Soc., 26, Down-street, Piccadilly.

TO GENTLEMEN, FLORISTS, AND OTHERS,

TO BE SOLD BY AUCTION.—By Mr. IZOD, at the Auction Mart, Bartholemew-lane, on Tuesday, March 19, at 12 for 1. A Choice Stock, the entire property of Mr. W. Alexander, of Lamb Farm, Kingsland, comprising a FINE COLLECTION of CARNATION PICOTEES, ROSE TREES, GERANIUMS, and other choice plants. The Carnations comprise Twitchet's Don John; Martin's Splendid; Puxley's Prince Albert; Hepworth's Brilliant True Briton; Lowe's Grand Sultan, Marchioness of Westminster, Lord Palmerston; Maudsley's Beauty of Woodhouse, Bonny Bess, &c. Picotees—Nulli Secundus, Williams' Mrs. Hamilton; Robinson's Nottingham Hero; Ely's North Midland; with a choice stock of Geraniums, comprising the leading varieties, 200 Dwarf Roses, and other miscellaneous plants. May be viewed on the morning of sale, and catalogues had at the Mart, and of Mr. Izod, at his offices, 2, Warnford-court, Throgmorton-street, City.

TO GENTLEMEN, FLORISTS, and OTHERS.

MESSRS. PROTHEROE and MORRIS will submit to public competition, at the Auction Mart, Bartholomew-lane, on Thursday, March 21st, 1844, Friday 22d, and Tuesday, 26th, at 12 o'clock, about 2000 Standard and Dwarf ROSES, consisting of Bourbons, Perpetuals, Hybrids, Chinas, &c. CAMELLIAS, well set with bloom, DAHLIAS in dry roots, &c.—May be viewed the morning of sale; Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

TO BE SOLD, a Quantity of VINE PLANTS—all PRUNED SORTS: One-year old Cuttings now ready for Planting, raised under the directions of Mr. Stafford, late of Willersley Gardens.—Direct to Mr. James Rawlinson, Belle Vue, Matlock Bath, Derbyshire.

TO BE SOLD, about 1000 clean, robust, well-grown Succession QUEEN PINE PLANTS, from 2s. 6d., 3s. 6d., to 5s. per plant; those at 5s. will fruit this autumn, delivered free in London. Gentlemen in want of such will find this an advantageous opportunity of supplying themselves. Application to be sent to Mr. Kernan, Seedsman, 4, Great Russell-street, Covent-garden, or to Mr. Truider, the Grower, Forest-hill, London.

FARMS TO BE LET IN THE ISLE OF WIGHT:—

FORELANDS, at Bembridge, in the Parish of Brading;

Containing:—Arable	220a.	1r.	33p.		
Meadow and Pasture	26	1	15	a. r.	p.

Homestead	7	2	14—429	1	14

For Particulars and to treat for Lease apply to Messrs. H. and R. B. Sewell, Newport, Isle of Wight.—Mar. 15, 1844.

COTTAM and HALLEN, Engineers, Ironfounders, &c. &c., No. 2, Winsley-street, Oxford-street, London, and at Cornwall-road, Lambeth.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices, in consequence of the present depressed state of the Iron Trade.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public, or Private Buildings, &c., with Cottam's Patent, or Rogers' Boilers. After 15 years' experience, and having fixed upwards of 1500 Apparatus for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale. For the convenience of those who wish to fix their own Apparatus, they have affixed the following low prices:—

Cottam's Patent Boiler, 18 inch . .	£2 15s. 6d.
Rogers' Boiler, small size	1 17 0

Larger in proportion.

Hot-water Pipe, at 2, 3, and 4 inches, at reduced prices.

The Tank System on an improved principle, that will heat the house at the same time, without pipes.

GARDEN ROLLERS 18 inches long, 34s.; 20, 44s.; 22, 50s.; 24 inches, 60s.; 26, 75s.; 28, 84s.; 30, 105s. each.

CAST-IRON RICKSTANDS, 2 feet six inches high, 5s. 9d. each.

Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and every description of Horticultural Articles, Agricultural Implements, and Furnishing Ironmongery; Dr. Arnott's Stoves, Anglo-Belgian Cooking Stoves; Broiling Stoves. The above low prices being on account of the depression in the Iron Trade, are subject to future alterations.

STRONG IRON HURDLES, 3 ft. high out of the ground, 6 ft. long, with five horizontal bars, weighing about 36 lbs., 3s. 6d. each.

Light Cattle Hurdles, 3 ft. 6 in. high,	weighing 42 lbs.,	4 0	"
Strong do.	do. do.	45 lbs.,	4 4 "
Ox Hurdles, 4 feet high,	do.	60 lbs.,	5 6 "

BEST WIRE, for STRAINED WIRE FENCING, at 9s. 6d. per bundle of 150 yards each. Uprights for ditto, 7d. each. The Improved continued, and every kind of Fencing, Fancy Wirework.

HAND-GLASS FRAMES for Cucumbers, &c., 18 inches square, 3s. 6d.; 20 inches, 4s. 6d.; 22 inches, 5s. 6d. each.

CAST-IRON FLOWER-STAKES, 4 ft. long out of the ground, 7s.; 4 ft. 6, 9s.; 5 ft., 11s.; 6 ft., 15s.; 7 ft., 20s. per dozen.

Show-Rooms at the Manufactory, No. 2, Winsley-street, where every information may be obtained.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON and CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks, which are ornamental in appearance, can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. Mr. Rendle, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

MELON SEEDS.—A very liberal Remuneration will be given for some PERFECTLY PURE AND GENUINE SEEDS of the under-named Melons; or Seeds procured the last year direct from China, Cabul, and Candahar, will be given in exchange.—Striped Hoosainee, Daree, Geree, Garmek, Melon o Gerger, Nukshevan, Sweet Melon of Ispahan, and Italian Green Gourd.

Application to Mr. G. MILLS, Gardener, Gunnersbury Park, Acton, Middlesex.

The Gardeners' Chronicle.

SATURDAY, MARCH 16, 1844.

MEETINGS FOR THE FOLLOWING WEEK.

TUESDAY, March 19	Horticultural	8 P.M.

WEDNESDAY, Mar. 20	Microscopical	8 P.M.
	Society of Arts	8 P.M.

A WORK has lately been published by Dr. Von Martius, on the EPIDEMIC DISEASES OF POTATOES, and to this work we shall again have occasion to refer. He enumerates all the diseases that have been observed from time to time in Potatoes, and describes more particularly two forms which did extensive damage to the Potato-crops of Germany in 1841. These he calls, in German, Stock-fäule, and Räude—in literal English, Stem-rot, and Scab. It is to the first of these diseases, stem-rot, that we wish to draw attention as resembling, in many of its symptoms, the *moist gangrene* we spoke of in our last article. There is, however, this difference between that disease and the one we are about to mention, that the former attacked only leaves and fruits, and was accompanied by the presence of a large quantity of moisture, whilst this attacks the tuber, an underground stem, and is characterised by a diminution of water in the tissues of the plant. It is, in fact, a form of *dry gangrene*; and Martius calls it, Gangræna tuberum Solani.

When Potatoes are attacked with this disease, the first thing that is observed is a drying-up or shrivelling of the tuber. The skin loses its ordinary lustre, becomes wrinkled, and shows at last little irregular spots, of a dark-brown colour, which, as the disease progresses, run together into larger spots. In these places the skin seems thicker, and has the appearance of having been rubbed against something. Subsequently the tissue of which the skin is composed becomes loosened and torn; and by the breaking-up of its continuity it assumes the appearance of the bark of an old tree. Sometimes the skin is split up into distinct patches, like scales. At the commencement of the disease, the interior of the tuber does not suffer; but, at last, a change of colour takes place in the tissue under the spots on the skin. Patches of a yellow or brown colour are observed, which are at first isolated, but at last run one into the other. These patches are drier than the surrounding tissue; but up to this period in the appearances of the disease, no changes have taken place that render the tuber unfit to eat.

As the disease advances, little warts or excrescences form on the skin, which are of a dark colour inside; they are at first small, but keep on extending; and at last run one into the other. From the surface of these warts a fungus, belonging to the mould tribe, is observed to project. The Potato now begins to emit a disagreeable odour, and its physical character is generally changed. Its specific gravity, which in a state of health is 1.163, becomes successively reduced as the disease proceeds, and at last is about 0.9. When in this state, it is frequently attacked by a species of Acarus, the A. farinæ, which feeds upon the grains of starch. If the Potatoes are planted with this disease, in no case do they put forth healthy shoots. In the commencing stages, the eyes put forth shoots which rise above the ground, but soon perish. In the latter stages, the whole tissue of the Potato is involved in the disease, and on cutting into it, it presents a dark-coloured disorganised mass, very dry, and not unlike the appearance of a truffle. The attempt at putting forth shoots now results in the formation of little knobs, varying in size from a quarter of an inch to an inch in circumference, and having a red or rose colour on the outside.

On examining the tissues under a microscope, it will be found that the cellular tissue of the skin has lost its transparency and become of a brown colour, and that of the interior has lost its brightness, as well as its moisture and whiteness. The starch grains gradually disappear, and cells filled with air and a yellow fluid occupy their place. Many of the cells are torn, and the intercellular passages are filled with a brown fluid.

Scattered between the cells in all directions will be seen dark-coloured, opaque grains, of varying form and size. These grains do not develop any further, but at last burst, and in their appearance and history resemble the Protomyces, or primitive Fungus germs of Unger. On cutting into the little knobs, masses of the fibres of a Fungus are observed, which at last make their way to the surface, and there either fructify or become shrivelled into a whitish layer. Sometimes the fibres of this Fungus, which are very delicate and transparent, are found throughout the whole mass of the diseased tuber. On examining these fibres, they present two distinct forms, the one being probably a variety of the other. Martius has named it *Fusisporium solani*.

Potatoes thus diseased have been chemically examined by Dr. Buchner. The starch of the Potato does not appear to undergo much change as long as the tubers are kept from the influence of moisture, or that the dry form of the gangrene does not give way to a moist one, which is sometimes the case. The albumen of the Potato entirely disappears. The greatest alteration is in the water, which is reduced to half the quantity that exists in healthy Potatoes.

In healthy Potatoes, the water is	73	parts.
In diseased " "	85	"
In healthy Potatoes, the dry matter is	26	"
In diseased " "	64	"

The lignin becomes of a brown colour, and is converted into humus. A more accurate analysis than the above has not at present been obtained. The following, however, is an analysis of healthy Potatoes by Pfaff:—

Water	76.6
Starch	11.2
Lignin	7.8
Mucus and Salts	3.7
Albumen	0.7

These figures are the mean of nineteen analyses:—

We are not aware that this form of disease has prevailed extensively in England; but we have lately received communications from correspondents complaining of their Potatoes, and in some instances we make little doubt that they are suffering from the disease we have just described. We wish our correspondents would be more particular in their descriptions of the diseases of plants, or, which is far better, send us up specimens for our own examination.

With regard to the causes of this disease, nothing certain is at present known. In Germany it has occurred in all soils and in all weathers. It has occurred to almost all sorts of Potatoes, and after all modes of planting and gathering, so that many have been inclined to attribute it to the influence of contagion; whilst those who are advocates of the doctrine that all diseases spring from the sporules of fungi, will at once conclude that the existence of the fungus in this disease is a proof of its having originated in their presence. We shall, however, consider the subject of contagion and infection in their relation to the propagation of disease amongst plants, in a future article.

For the present we can only say, that for the prevention of the dry gangrene in Potatoes every precaution should be taken in planting them, to secure their healthful growth. The conclusions of Von Martius are as follows:—The newer the variety is the better. The Potatoes intended for seed should be grown separate from the rest. The seed-Potatoes should not be kept heaped up in damp cellars, and allowed to shoot before they are planted, and they should never be cut for sowing till they are brought into the field.—*L. E.*

WE are sure that all sensible gardeners who are striving after eminence in their art, will have read with interest the various papers by Mr. W. Wood, which have from time to time appeared in our columns. We would now invite their very particular attention to a communication, nominally on FUCHSIAS; but really on the whole *rationale* of potting plants, the commencement of which appears in our columns of to-day. They may not, perhaps, entirely agree in all the views of Mr. Wood, but they will find in the principles which he inculcates, much that they cannot reflect upon without advantage.

We are too well aware that many gardeners disregard first principles, and rely entirely upon what *they* call experience, but what *should* be named blind chance. It is not, however, the intelligent men among them who do this; and we trust that the day is near when no one will care to avow it. For however reluctant cultivators may be to apply the first principles of Horticulture to practice; whatever success may attend the attempts of the ignorant, jealous, or crafty, to throw obloquy upon the advocates of a rational system of gardening; and however difficult it may appear to apply theory to practice; we may rest assured that the day is near at hand when first principles, though last learned, will be universally recognised as the only guide to be safely followed.

Gardeners are, as a body, far better informed and more intelligent than any men in their own condition of life; and it is only necessary for them to turn their attention steadily to an examination of the causes that produce the results with which they are familiar, to win for themselves a really high station in the estimation of the world. It is an earnest striving after perfection that alone leads to distinction. For attempting to inculcate those truths, ourselves, Mr. Wood, and others, have been assailed in the most unworthy manner. The attacks made by a disreputable portion of the press upon the course we have seen fit to take on this subject have been unjust, false, virulent, and vulgar; discreditable to the taste and temper, and disgraceful to the character of their writers.

A popular authoress, when speaking of her hero, has happily observed that—"The more he learned to see, the more afraid of darkness he became. He was very much afraid of ghosts; yet the ghosts which he feared have been known among men from time immemorial. *Ignorance*, a wonderfully large lady, clothed in glittering white texture; *Selfconceit*, her long-necked child, who always treads in the footsteps of her dear mamma; and *Boasting*, which must be the ghost of an old French language-teacher, who in his lifetime had been connected with these ladies, and often been seen in their company." Let all Gardeners be as much afraid of ghosts as Cornet Charles, and, like him, take for their motto "FORWARD! MARCH!"

FUCHSIAS.

FOR easy culture, elegance, and long continuance of bloom, the Fuchsia is probably unequalled. Its fitness for growth in pots or open borders, for portable specimens, or for permanent effect, and, above all, its adaptation to almost every kind of soil (under proper treatment,) give it more than ordinary attraction. Though Nature has omitted to endue it with her most spiritual attribute of odour, she has so mantled it with the "perfection of beauty," that the most fastidious taste could not imagine a more graceful and brilliant form of vegetable structure. There is scarcely, however, another race so generally grown respecting whose cultivation such opposite opinions are entertained. Whilst one man recommends exclusively the annual growth from the root, directing each preceding season's shoots to be removed, a second as strenuously maintains the value of the previous year's growth, as the best means of ensuring prolific bloom from the exhausted, but partially renovated source of by-gone vigour.

As the permanent character of plants may, to a great extent, be determined by their capability of accumulating such an annual supply of sap as may be sufficient to maintain their fertility unimpaired in successive seasons, it may be confidently assumed that the constitutional vigour of all plants is impaired in proportion to their excessive fertility, which being the ultimate function of vegetable life, can only be continued by the reproduction of the organs (or buds) essential to the formation of bloom. The Fuchsia is one of the most striking instances of fertility in plants; and, apart from other objections to the modes of cultivation just mentioned, which however will be productive of favourable results by good management, it may be stated as certain, that a better method is to be expected for managing all plants whose tendency to bloom is strictly commensurate with their annual amount of growth; a habit which is strongly characteristic of the present genus. The management of Fuchsias, to which the present remarks are introductory, commenced from their first stage of growth in the 2d and 3d weeks in March 1843.

To successful cultivation the following qualifications appear requisite:—A knowledge, 1st, of the constitutional habits of the plants to be grown; 2d, of the nature of the materials (soils, &c.), best adapted for their growth; 3d, of the extent to which such soils, &c., can be applied; 4th, skill to maintain the means essential for growth by a due regulation of light, air, heat, and moisture.

Before proceeding to practical remarks, it will be as well to refer the reader to opinions given in a previous Paper, viz., that 1st,—"It is the elementary condition of an organised being, which favours the ultimate development of its parts. 2d, That a uniform circulation of the fluids necessary for the highest objects in Horticulture, is the result of adapting the arrangement, proportions, textures, and qualities, of the materials employed in cultivation, to the organic structure of plants, and to the external agencies which operate upon them throughout their entire growth."—(*Gardeners' Chronicle*, 1843, p. 820.)

Admitting the correctness of these conclusions, the following inference is clearly to be drawn from them, namely: that there is no arrangement of soil essential to the perfect condition of a plant, which is not proportionately essential throughout its whole period of growth. That the fertility of plants is regulated by the modified action of atmospheric and solar agencies upon other elements in Nature, is too well known to require proof; but it is equally certain that the most fit medium by which such agencies can be applied is not equally well understood; or why is it that opinions are still given, that the condition of certain plants has been caused by the presence or absence of some single substance? Why is it that we hear of such various combinations of matter for the conveyance or suspension of the elements of food for plants? Why is it that so many ingenious external contrivances are sought out and applied as attracting influences and channels to convey the vital elements of Nature to every organised being, however diversified its structure?—as though a perfect system of cultivation would be found in connexion with the greatest extent and influence of atmospheric agency. The next generation will smile at the fact that their predecessors, with all their skill, were advocates of such internal materials for the growth of plants as would most readily imbibe the vivifying influence of atmospheric and solar agency, in connexion with external structures which would be the least pervious to them.

The first general truth in the department of Horticulture, to which the present subject refers, is, that every operation of art implies a limitation of the agencies of Nature; the successful application of the former being exactly in proportion to the correct recognition of the laws of the latter.

In illustrating these remarks I must once more advert to the primary truths upon which a correct arrangement of soils depends in artificial cultivation; and the reader is particularly requested to compare the principles stated at p. 848, (1843), with the following:—

§ 1. The particles of which all matter consists being subject, by the law of attraction, to form solid bodies, are, in the absence of a modifying agent, unfavourable to that condition which admits the action of other essential agencies in growth. The soils employed for plants in pots being circumscribed, are subject to the force of attraction, by the increased pressure of their parts towards and upon each other.

§ 2. As the force of attraction in matter, implies a division of its parts to be attracted (or *vice versa*), it also implies an agent capable of acting singly upon its parts.

§ 3. The force of attraction, by the pressure or cohesion of matter, being in proportion to the number and closeness of its parts in any given body, it follows that any arrangement by which such parts are diminished or increased, must necessarily be a modifying power, or agent, whereby the force of attraction is governed.

§ 4. The primary agent in Nature, which operates upon the form or arrangement of matter, previous to its decomposition, or affinity, is mechanical force.—(Herschel).

§ 5. If the attraction or cohesion of matter may be modified (§§ 3 and 4) by mechanical agency, it may be inferred that such a modifying power or agent is essential to the condition of other agencies acting upon matter. The proportions of soils in pots being subject to attraction by pressure, increase the force of attraction by lessening the distances of the individual parts, and diminish the force of attraction by increasing the distances of such parts (§ 3.)

§ 6. As matter, when circumscribed, is subject to an undue attraction of its parts (§ 1), and as mechanical agency is a modifying cause of attraction (§§ 3 and 4), it may be assumed that a just mechanical arrangement is essential in all soils employed in growing plants.

§ 7. As the force of attraction is in proportion to the number of parts in any given body, (§ 3), and is inversely as the distances between such parts, it follows that mechanical agency should be strictly in proportion to the number of such parts.

§ 8. All elementary substances are capable of entering into combination with each other only in fixed or definite proportions, and not arbitrarily. (Herschel.)

§ 9. What is thus true of combinations may be assumed to be true of mixtures; and therefore the proportions of soil in which plants are potted should also bear a strict relation to each other.

§ 10. As the soils in which plants are potted may be acted upon by other agencies, only according to their uniform condition,—1st, mechanically (§ 7); and 2d, chemically (§ 8); it may be assumed that a law of mutual relation is the only true basis of a perfect arrangement of soils for the growth of plants.

§ 11. The fitness of pots for a perfect arrangement of soil, will be in proportion to their uniform admission (externally and internally) of the mechanical, chemical, atmospherical, and solar agencies, essential to the support of plants (§ 9).

§ 12. As the mechanical and chemical properties of soils are modified by atmospheric and solar action, the latter exerting an opposing tendency upon the former, it may be assumed that the mutual relation or counterbalance of these opposing agencies to the growth of plants constitutes the law of equilibrium, by which the vital elements of support to plants are held in solution for such period as their organic structure, or assimilative power demands.

§ 13. As all plants are sustained by agencies peculiar to their organic structure, and possessing a mutual relation and dependency, it is shown by § 8, that the absence of one agent cannot be supplied by the excess or modification of another.—*William Wood, Pine-apple Place.*

(To be continued.)

PLAN OF A MELON PIT.

BY MR. R. GLENDENNING, NURSERY, TURNHAM-GREEN.

MR. KNIGHT has very justly remarked that "there is not any species of fruit at present cultivated in this country which so rarely acquires the greatest degree of perfection which it is capable of acquiring in our climate as the Melon." *

One of the great evils attending the common mode of producing the Melon in this country is the practice of raising them on dung-beds, where the roots are permitted to descend into the rank decomposing material under them; the plants, of course, grow very luxuriantly, in consequence of receiving an immense supply of impure and improper food, which is a fact well known by all practical gardeners. In order to obviate this evil, I have been employed by a scientific gentleman in this neighbourhood to design a pit for the culture of the Persian varieties of Melons; his object is to produce them in the highest possible perfection, which I am quite sure cannot be accomplished on a common hot-bed, for Persian Melons are much more difficult to manage than the kinds in general cultivation.

* Knight's Hort. Papers, p. 191.

EXPLANATION OF THE PLAN.

A, Burbidge and Healy's Boiler.
b b, Iron troughs. *c c*, Pipes.
d d, Iron troughs as at *b b*, in Plan.
e e, Pipes as at *c c* in Plan.
f, f, Copper tubes fastened to the troughs to admit steam when required.
g, Wire-trellis on which to train the plants.
h, h, h, Convenient places for the growth of Seakale, Rhubarb, or Asparagus, or keeping tubers of any kind during winter.

This pit is intended for Melons in summer, and to preserve Pelargoniums, or other plants in winter. As the object in constructing it is more for the purpose of experiment than the permanent culture of Melons, I have designed it so that Pines may be substituted without any alteration whatever; indeed, any kind of plant, which such a structure is capable of receiving, and at the same time requiring protection and a warm temperature, may be very advantageously introduced, the hot-water apparatus being so contrived as to command both bottom and surface-heat, either separately or conjointly. For the purpose of supplying soft water for the plants, I have placed a slate cistern at one end of the pit, in order to collect the rain-water from the roof. The soil, if permitted to come in contact with the iron troughs, would, of necessity, become dried, and totally unfit for the roots of any plant. With a view to obviate this, I have placed rough flint, or other stones, over the bottom of the bed, and around the troughs, to prevent immediate contact, and at the same time, to admit of a more uniform diffusion of heat over the bottom of the pit, so that the soil which rests upon it may be more regularly heated. The other advantages and conveniences of this pit will be apparent from the above plan and section, without further remark.

ENTOMOLOGY.—No. LVI.

THE POPLAR-GALL APHIS (*Eriosoma bursaria, Linn.*)—Having recently given the histories of the Elm-tree-gall Aphis and the American Blight, the economy of another species, which is a genuine Eriosoma, may not prove uninteresting, especially as it is the animal which led to the destruction of the Poplars at Evesham. In the early part of August and September, I have frequently observed excrescences upon the midrib and stalks of the Poplar leaves (fig. 1), which are invariably at the back; if the seeds of the foot-stalk be twisted in contrary directions, the suture in these galls will readily open, and the contents will be exposed to view. The galls are green with a rosy tint, more or less convex, with an irregular surface, and very thick comparatively; they generally contain a very considerable number of wingless individuals, varying in size; and I have seldom found more than four or five winged ones in them. The inner surface is covered with liquid globules, powdered over and resembling a vast number of eggs of all sizes, which soon dry up and disappear on being exposed to the air and light; the old exuviæ are also scattered about, and amongst them I detected some young Eriosomas with remarkably long tails (fig. 3), which were white, and appeared to be of a cottony substance; and it seemed as if the skins on moulting had been strung upon this appendage, for I have little doubt that the six minute claws visible at short distances are the skins from the six legs, in which case there is evidence of the specimen represented having moulted at least thrice (fig. 2). These little apterous Eriosomas were very pale-green, with black eyes and short 4-jointed horns. The winged specimens (fig. 5) were also very pale-green, the head and thorax dusky, the eyes black, the horns rather short and 6-jointed, with a seventh joint or minute tubercle at the inside of the apex; they were powdered over with pearly white, and the apex of the abdomen was woolly and destitute of tubes (fig. 4); the wings were colourless, with a large pale fuscous stigmatic spot, a large marginal cell, with three oblique nervures beyond, the first not forked at the apex (*), and the second and third uniting at the base; in the inferior wings the basal nervure forms a trident; the legs are short, especially the anterior, and slender; the feet are two-jointed, the basal joint minute, the other terminated by two claws.

The Poplar and Elm-tree galls are formed by a wingless female, which in the spring fixes upon a bud or stalk, and, piercing it, the extravasation of the sap causes the vegetable matter to assume an unnatural and distorted shape, and gradually expanding as the insect buries itself deeper in the tender tissue, it is at last completely enveloped. There she becomes the parent of a large family, sometimes producing eight daily; and by giving birth to young Eriosomas instead of laying eggs, the brood increases at a prodigious rate; for they grow rapidly, undergo their moultings at very short intervals, each one speedily becoming a mother in its turn; and at a later period of the year winged females appear: so that before the original founder of the colony dies she is surrounded by a numerous offspring, removed by many generations. Here, as, indeed, everywhere, we see the wisdom of the Creator in his works: the duty of the first female being to form a dwelling for her family, she is unprovided with wings—they would be an encumbrance to her, and it is even probable that their development might diminish her fecundity; but when the family has attained sufficient extent winged females are perfected, which, led by instinct, depart from the place of their birth, to disperse their progeny over the face of the earth; these are always so different in appearance, and vary so essentially in the anatomical structure of the thorax, that, knowing them to be of the same species, one would never imagine they were of the same sex.

In all probability, the expansion of the gall causes it to crack, or an entrance may be made by insectivorous birds or ants, wasps and other insects, which, attracted by or feeding upon Aphides, may gain access to the interior through the natural suture, and thus the winged specimens are enabled to escape from their prison and wing their way to other and distant districts to deposit eggs, which will again provide for a succession of wingless and viviparous females the ensuing spring. These helpless animals seem to require the protection of an artificial covering to guard them from the extremes of heat and cold, and unless the inner surface of the gall were kept moist, in the manner already alluded to, it is probable that

the sap would not flow, and these feeble creatures would all perish. In these cells one would have supposed they must rest secure, but such is not the case, for they are never free from the inroads of Aphidivorous insects, such as the larvæ of the Ladybirds, Syrphidæ, &c.,* many of which I have found living amongst the Plant-lice in the galls, luxuriating upon their flocks, which seem scarcely to be diminished by the hourly drafts which are made upon them: this, however, is not actually the case, for a single larva of a Syrphus will often, before it arrives at maturity, entirely clear a gall of the Plant-lice.

I wish to repeat, that the Eriosoma bursaria is a typical species of the genus; and if the nerving of the wings be compared with that of the Elm-tree-gall Aphis and the American Blight, it will be seen that it varies very materially, so that a careful observer could readily distinguish the first from either of the others, which are also easily separated by the form of the stigma.—*Ruricola.*

FAMILIAR BOTANY.

Morphology, No. VII.

(Continued from page 148.)

What is this mighty breath, ye sages! say,
That in a powerful language, seen, not heard,
Instructs us? —— What but God?
Inspiring God, who, boundless Spirit all,
And unremitting Energy, pervades,
Adjusts, sustains, and agitates the whole?
He ceaseless works alone, and yet alone
Seems not to work; with such perfection fram'd
Is this complex stupendous scheme of things.

If it is a fact almost surpassing man's powers of comprehension, that all the varied products of vegetation are but little changes in the proportions of the elementary matter that constitutes the fabric of plants—which fabric is, moreover, itself, for the greater part, a mere condensation of air—it is not less curious, though far more intelligible, that the different kinds of tissue which are gathered together into stems and leaves, and flowers and fruits, should themselves be but changes from one common form of tissue, notwithstanding the diversity of forms in which it finally appears.

If you boil a head of Asparagus, and then rub it in water in a dish, you will find that it separates into different parts, one being a kind of pulp, the other strings. The pulp consists of minute bladders; the strings are composed of fine threads of different kinds. Or, again, take a young shoot of the Elder-tree, and pound it in water; it, also, will separate into pulp and strings, the former consisting of bladders, and the latter of threads, as before. Such bladders and such threads are found in all plants, constitute what is named their tissue, and form the whole fabric of vegetation.

Nothing can be more different than the forms of tissue. The bladders are more or less round and brittle, constitute pulp, pith, cork, and such parts, and, from their appearance when cut across, are named *cellular tissue.* The threads are very long and tough, and some of them extremely curious, resembling little corkscrews of silver. A muslin handkerchief is composed of threads that are straight, extremely fine, and several inches long; such threads form wood, give toughness to all the parts of a plant, and are called *woody fibre.* If you snap the stalk of a Strawberry leaf, with a little care, you will find that it contains a fine cobweb-like substance in its interior; the parts that snap and cover up the cobweb are, first, a layer of cellular tissue, and next a coating of woody fibre, which guards the cobweb. The cobweb itself may, with gentleness and care, be pulled out to a considerable length, and will be found, when viewed against the light, to consist entirely of spiral threads of inconceivable fineness; such threads we name the *spiral vessels.* These kinds of tissue are all very different, not merely in form, but in the uses they are for; thus the cellular tissue is for digestion, the woody for strength and the conveyance of sap, the spiral for the passage of air. Yet they are all one, as may be demonstrated.

The Oak grows out of an Acorn, the Wheat from a grain of Corn, the Cocoa-nut tree from the contents of a hollow shell. The Oak, the Wheat, the Cocoa-tree, have both cellular, woody, and spiral tissue; but the Acorn, the Corn, and the shell have nothing but the cellular. It would therefore *seem* from this that the two others must be fashioned by the powerful hand of the Creator out of the cellular. But the Morphologist is not contented with an inference; he looks for proof.

Armed with a powerful microscope, keen knives, and yet keener eyes, he patiently watches the progress of development in the germinating embryo, and then he finds that some of the little bladders lengthen, thicken, and cluster together, till they cease to be bladders, and become long and delicate threads. He looks again, and lo! there are other cells, which also lengthen, but without becoming tougher, and gradually form on the inside of their thin transparent sides a spiral line, which applies its turns the one against the other, till at last a second shell, spiral and tough, though indescribably slender, is deposited within the first. The primitive bladder has, in truth, the double property of lengthening on the one hand, and of depositing matter, which is secreted all over its inside, in a spiral direction, or as a uniform varnish, or in a variously broken and interrupted layer.

Here, then, we have proof, irresistible and convincing, that the many textures of a plant consist of bladders, differently varied by the wondrous power of life. Unchanged, and in their primitive condition, these bladders form mouldiness, Mushrooms, pith, pulp, and all the softer parts; lengthened out, and rendered tough by a smooth lining of matter secreted within them, they become wood, and the powerful net-work which holds together the leaf, and gives it force to resist the storm; or extended, and lined by a spiral thread deposited within them, they form the exact imitation of the breathing apparatus of insects, and almost of man.

And thus does Nature simply work in the elementary construction of that which seems so wonderfully complicated a machine, the fabric of a tree. Three, or at the utmost four, air-like bodies are condensed into bladders, to which the power is given of secreting internally matter like themselves, and of assuming various forms at the bidding of the vital force. The bladders in their new shapes are compelled to arrange themselves in the endless forms that clothe the earth with a verdant mantle; and thus, and thus only, are provided the materials of the largest of the Kingdoms of Nature.

Untutored man looks on such things without seeing them; he is surrounded by silent prodigies more surprising than the wildest dreams of fancy; and he knows them not, or disbelieves. He is satisfied with results, and thinks not of their causes. It is only to the philosopher that are revealed the mighty secrets of the hidden places of the earth.—*R. E.*

* Vide the *Gardeners' Chronicle*, vol. I. p. 65, and Royal Agric. Journal, vol. III. pl. C.

THE ROSE-GARDEN.—No. VII.

(Continued from page 117.)

Plants which have been weak, sickly, and unfit to work the first season, will frequently break at several joints in the spring, beginning from the root; in this case, the converse of the habit of a healthy plant is exhibited, in the unhealthy the highest shoot is the weakest, in the vigorous the greatest power is displayed at the summit of the plant. When the weakness of a plant is determined, the whole of the buds should be allowed to push, in order to loosen the bark; when each push has produced two or three pair of leaves, the highest, which is in general weak, should be removed, the two next left to increase, and all below them stopped, only one or two pair of leaves being left to each, their final removal not taking place until the three upper shoots left to increase are become vigorous.

Insects.—In order to secure the shoots from the attacks of the caterpillar, it is necessary to look over them frequently, destroying slugs and snails also, as all of these do much injury—the first by eating the point of the shoot, on which it remains whilst there is food, twisting the end leaves together, and living on them—the others by eating through the shoot, frequently at its base, if not large and ripening.

Keeping shoots even, and removing thorns.—As soon as the spring-shoot is over, it will be well to look over the stocks, and wherever a single shoot be found which is running away from the others upon the same stem, it must be stopped by pinching off the extreme point, in order to bring the others up to it, that all the shoots may assimilate in size by the time they are to receive the bud. On the 1st of July, it will be well to remove the thorns from the places desired to bud upon. If this be delayed, the plant will have had no time to recover from any slight injury; and if omitted, there will be some trouble and inconvenience in placing the buds. A sufficiency of the shoot should be thus cleared, to allow of the ligature being bound around, without any thorn interfering with the operation.

Time of Budding.—It may be observed, that the growth of the wild Rose differs so much from that of most other plants, that shoots may be found to receive a bud at all seasons of the year. A plant budded on the 21st of October with a species not free growing, was the forwardest, out of fifty which had been budded the same autumn, to start vigorously in the following spring. If, therefore, an unexpected shoot break in a desirable place from a stem (already budded in August or before), use should be made of it without reference to the time of year.

From the beginning to the end of August is, perhaps the most certain time to bud with a dormant eye (*a l'œil dormant*), as the sap is then in full force, especially if the season be moist, after a drought. The passage of the sap, however, varies in different years, and the time to bud of course varies with it. The desideratum is, that the trees should be in full vigour, and the bark part with the utmost facility from the wood, showing a rich supply of sap below it. This is, in general, the case at the season before mentioned. A fall of rain should be taken advantage of, if possible; for, be it observed, that budding during a long drought would be labour entirely thrown away. If the season, therefore, advances without rain, and the sap in consequence be checked, the substitute (which, by the bye, is a poor one) of watering the roots of the stocks well for some days beforehand should be adopted; but, in the event of rain, the operations may be commenced the next day. Early in the morning, and late in the evening, are the best times to bud; and a cloudy atmosphere affords the most advantageous opportunity. Above all, a day having a dry northerly or easterly wind should be rejected, for great evaporation taking place at that time, the tender parts exposed to it are instantly dried up, and the work is frequently destroyed before it is completed.

It will be observed, that during wet weather plants increase in bulk, during hot weather in length; if, therefore, a long continuance of heat and drought take place (especially in a poor soil), after the working of a plant, the action of the sun, which drives the sap to the point of the shoot by contracting the bark, loosens the ligature, and the inserted eye frequently perishes. For this reason it is desirable to enter the buds as soon as each plant is forward enough to receive them. Stopping the end of the shoot may occasionally remedy the evil, by preventing an extension, and thus causing it to swell. When a slight or indeed heavy rain takes place just before the stocks are setting, the sap will be found in motion, and buds may be inserted with facility; but unless a continued supply follow, the juncture of the newly inserted bud with the stock will not take place, and failure may be expected.

Dormant and Pushing Buds.—The difference in England between a dormant and pushing-bud (*œil dormant* and *œil poussant*) is generally one of chance, and almost confined to free-growers. The time chosen to bud is commonly the end of July, or beginning of August; and if a bud springs, the branch is shortened, two or three buds only being left on the branch, (and these are pinched off, one by one, as the shoot advances:) these, of course, beyond the inserted bud, which thus has a chance of shooting strong enough to ripen before winter: if this be done, one bud should always be left (though nipped at the point to prevent its occupying the sap), as a security during winter, which would otherwise be more likely to cut off the shoot, which has, as yet, but little strength. This lopping a branch, however, at a time when the sap is at its fullest, cannot but injure the root of the plant, by the temporary stagnation it causes.

Grafted and budded Roses of all sorts will be found to dwindle away, when the heads they carry have become weak and the bark of the stock set and hard for a whole season. On the transplantation of all worked Roses great care should be bestowed to secure the roots from injury, as well as to replace directly (rapid growing soils suffering less from temporary stagnation than delicate ones). The stock, in its natural state, will exist and recover almost without a root, but it must be remembered that this pre-supposes it to have been healthy and vigorous, under which circumstances, when the top is cut off and the roots cut in, the vigour which is retained in the neck of the plant will make extraordinary exertions for its recovery; large shoots will be thrown out from its sides, and the activity of the plant will be rapidly restored; if, on the contrary, the stock be replanted with any shoots left upon it, this recovery will be neither so rapid nor so certain. Great attention is, therefore, necessary in pruning trees after transplantation, which operation should always be done with the object of promoting the speedy ascent of the sap and formation of fresh free-growing wood on the spot to which the plant has been removed. In direct opposition to this, many sorts of Roses, on their own bottoms, require lifting occasionally, to prevent the roots going too deep, and the flowers diminishing in quantity, as well as to divide the roots, remove the decayed parts, obtain offsets, &c.

In France, budding with a pushing eye takes place at the end of May, and is frequently used when, a few buds only being procurable of a certain desired species, it is an object to increase them as soon as possible; in this case, three or four natural buds should be left beyond that which has been inserted, and these should be taken away, as before mentioned, with the intervention of a week between each.

(To be continued.)

Home Correspondence.

Tank-Heating.—Permit me to make one or two observations upon the subject of tank-heating, of which I have now had some experience. My greenhouse is 45 feet long and 14 feet high, and therefore contains a considerable area. This I have succeeded in heating very perfectly, by means of the smallest size Rogers boiler communicating with a brick gutter cemented: the gutter is not divided, but passes round the house, obstruction to the entrance being avoided by carrying the water under the floor opposite the door, by means of a lead pipe which dips and rises on the other side to the same level; the water thus leaves the boiler, and passing once round the house re-enters the boiler. I conceive that this arrangement is to be preferred to the divided gutter, where the water-course is long, the water being less cooled than if it ran round the house and back again before it re-entered the boiler. You had some doubts as to the applicability of brick gutters with slate covering, to the case of greenhouses, fearing that the atmosphere might be too much charged with moisture. I can assure you that fear is quite groundless, as I find my house perfectly free from damp, and indeed the plants require watering now every other day, the soil becoming quite dry in that time; a moister state of the air may be maintained when proper, by raising two or three slates in different parts of the house. The slates I employ are a quarter of an inch thick, and are cemented to each other at the sides; this thickness adds to the strength, but I imagine, has the disadvantage of confining the heat longer than thinner slates would do, which might be equally well secured by cementing their edges, made to overlap. There is an appearance upon the surface of the water contained in these cemented gutters, which being a crisp scum and somewhat like a coating of ice, may have puzzled some of your readers who have seen it. I may mention that it is chalk, and that the water contained in a recently constructed cement tank is highly charged with lime; in fact, is pretty strong lime-water, feels soft to the fingers, and gives a bitter taste to the tongue; the carbonic acid gas contained in the air of the house, acts upon the surface of this lime-water, and converts it into carbonate of lime. I suppose that this solution of the cement is peculiar to recently constructed tanks, and such as have been made use of before the air had the opportunity of acting upon the surface, and converting it into carbonate of lime; and should the evil continue, I should be disposed to draw off all the water, and allow the tank to be exposed to the air for a few days. My gardener has been employing boiling hot water for the parts of my Mills' pits infested b

sow-bugs, and with very decided effect, those numerous and troublesome little pests yielding up their lives by thousands to this application.—*T. Harrold Fenn, Neyland, Suffolk.*

Pines.—I have lately seen some fine fruit from young plants, at Colney House, near Barnet. On Christmas week an Enville was cut there weighing 7 lbs. 4 ounces; a Queen, 4 lbs. 12 ounces; and a black Jamaica, 5 lbs. 3 ounces. Many more were cut previously of a similar size, but were not weighed. In the beginning of December an Enville was cut 6 lbs. 9 ounces; this was a curiosity in its way; three small fruit, each being perfect, grew out of the crown, and were all ripe at the same time with the principal fruit. Mr. John Fish, the gardener there, grows them almost entirely in loam from Colney Heath, using it as rough as possible. He attaches great importance to growing the plants very fast, and fruiting them when they are young.—*A Visitor.*

The Beefin Apple.—Being a native of Norfolk, I am well acquainted with our excellent Apple, the Beefin. This is frequently known by the names of Biffin and Beaufin; but Beefin is the true name, originating from its striking resemblance to a piece of raw beef.—*M. G.*

Gourds.—A correspondent some time since remarked that he had never seen the Potiron Jaune grown in England to anything like the size and perfection which he had witnessed in the north of France. In the year 1822, I grew in my garden at Stoke Newington, from seed which I had of the Society in Regent-street, a fruit which weighed 130 lbs., and which measured in circumference 5 feet 8½ inches. This I intended to exhibit at a meeting of the Society, but could not, at the time, find a convenient conveyance. After keeping it several weeks, till it began to decay at the part where it had rested upon the ground, it was placed upon the hall table as a curiosity, and was cut up and used, in lieu of Peas for soup, which was of a bright golden colour and excellent flavour.—*J. B. K. L.*

Excrescences on Oak.—"T. G. Clithero," at p. 22 of this year's *Chronicle*, appears to have misunderstood me on this subject, where I said the timber of trees having excrescences was generally shaky and worthless. "T. G." says, "it is of ten times more value, if not unsound, and that whatever may be the cause of the curliness, it has nothing to do with unsoundness." He says, further, "that such trees grow as vigorously as others, their neighbours." Trees may appear to grow vigorously, and yet be unsound in the inside. What I said was, that the trees (alluding to those growing in Porkington-park,) appeared to be of a great age, and showed symptoms of decay, from various causes, and that those that had been cut down were found to be decayed in the inside; namely, all the wood that had been formed previously to the commencement of the excrescences. I have lately seen many Oak-trees, including Pollards, covered with excrescences. The Pollards are all, more or less, decayed inside, some of them are quite hollow; but to look at their branches, they appear to be in vigorous growth. A person who has had much experience in working up such trees says, that if the trees are old he invariably finds the timber either decayed or beginning to decay. Hence it is only the curled excrescence that is of much value. He confirms what "T. G." says respecting its shrinking and requiring five or six years' seasoning, before being worked into furniture, &c., and says that it requires to be cut in a particular manner for such purposes, or it is of no value. The reason of curled wood of Oak shrinking, and requiring so long a time to season before it can be advantageously made use of, appears to be the premature decay of some of the annual shoots and buds, on account of their being crowded closely together; they are inclosed in the living wood, similar to the decayed branches sometimes inclosed in other timber; these make spaces in the wood like small holes and fissures, of a dark-brown colour. The excrescences are an after-growth, formed by the filaments or woody tissue from the numerous annual buds and shoots that grow, as it were, on the original wood, being obstructed by some cause in descending. Such curled wood recently formed, is generally sound to a considerable thickness, and it is only the curled wood that is valuable, and not the first-formed straight-grained timber. Such wood would be more valuable and more in demand, if cabinet-makers knew the proper way of cutting and seasoning it for their purposes, as it is the timber of such trees that is of little value. "T. G." is wrong when he says "the excrescences occur from a tendency the trees have to throw out roots from every part of the stem." He instances the roots, or protuberances that would be roots, in some kind of Apple-trees; but the excrescences on the Oak and Elm are very different from the knobs or burrs on some kind of Apples, which is an effort to make roots, but they cannot do this, except in a close, moist, atmosphere; the knobs on old Cherry or other trees not apt to emit roots, must arise from obstruction of the descending filaments. Protuberances of these, if of a large size, would probably be curled like the Oak and Elm; but the annual young shoots and buds on the Oak and Elm make no roots at all, except "T. G." designates the obstructed woody tissue roots, or the rudiments of roots; neither does the curliness penetrate into the previously-formed wood, but is evidently an excrescence formed upon, and after the original wood begins to decay in the inside, whether visible or not to outward appearance. All the trees having excrescences in Porkington Park, seem to be past their best, and, no doubt, beginning to decay inside; in many of them the decay is perfectly visible either at bottom, middle, or top; hence, when durable and profitable timber is required, such trees should be felled as soon as the excrescences make their appearance, except it is desirable in parks or pleasure-grounds to retain them for their singular appearance and the value of the curled wood.—*W. Billington.*

Durability of Oak-timber.—I fear that the beam found at Oswestry, and mentioned by Mr. Billington, (*Gardeners' Chronicle*, 1844, pp. 69 and 117), is not so old as he supposes. When reading that account, it struck me that the numerals were so given by him as to make it appear that they are the Arabic numerals now in use; and if so, it is highly improbable that the date really intended is 1035. If Arabic numerals were at all in use at that date, which I doubt, they must have been very rarely used. It is also highly improbable that the person who built the house, supposing the date to be 1035, should have been sufficiently acquainted with letters to be able to use them in this case, more especially as the Rev. T. Salway informs me that they are very perfectly formed. It should be remembered that Oswestry was upon a disturbed frontier, and also that grants of that early time are usually not dated, and that even William the Conqueror himself could not write. Mr. Salway tells me that he believes that the date was originally 1685, and that some person has altered it by cutting away the top of the 6. I believe, therefore, that the Oak-beam cannot be proved to be more than 209 years old, instead of 809; and this is of consequence, from an argument for the durability of Oak being derived from the former supposed date.—*Charles C. Babington.*

Garden Varnishes.—The composition described by "Devoniensis," at p. 301, 1843, is a very good one, and is used by the fishermen on the Norfolk coast to pay their stout calico-jackets with, thus making them waterproof. They add a little mutton suet. The mixture is as follows:—1 gallon of pale linseed-oil, 3*s.* 9*d.*, 3 oz. of sugar of lead, 3*d.*, 10½ oz. white resin, 1½*d.*, and ½ lb. mutton suet, 3*d.*—in all 4*s.* 4½*d.* the gallon. These simmered together will make a useful varnish, at a reasonable cost. The use of the sugar of lead is merely to dry the oil.—*Rambler.*

Miscellaneous.—*J. K.* suggests that it would be an advantage to country gardeners if gentlemen, instead of giving money prizes, were to offer rare plants as rewards at floral exhibitions. This, he imagines, would create a more general desire for fine flowers. For instance, he says, if a dozen of Verbenas in flower were given for a prize, it would encourage many to become florists, and thus strengthen the object of a society. A knowledge of the qualities of objects exhibited would likewise by this means be increased.——*Verax*, a known correspondent, in justice to Messrs. Youell and Co., states, that about this time last year he planted a few canes, had from them, which bore abundantly very large fruit, and continued bearing until the frost. He informs us that he had more this year, being so much delighted with the flavour, size, and long-continuance of bearing.——*J. P.* intimates that guano is an effectual destroyer of worms, as long as its influence lasts, and that by applying it frequently in small doses its action may be extended much. Being also beneficial in promoting growth, it is an important friend to the gardener.——*J. G.* informs us that he planted a few early Kidney Potatoes in an old Pine bed in a Vinery, about the beginning of December. He put about two feet of leaves in the bed, and covered the tubers about nine inches deep with soil. They came up very strong; but being far from the glass they became drawn. When they were about 18 inches high, he pinched about half an inch off the leading shoots of part of them, leaving a few untouched. Those that were stopped began in a few days to form Potatoes, but those that were not stopped produced only a bunch of fibres. Of the former a very fair crop is now ripening off, and our correspondent says that any kind of pit, however far from the glass, will answer the purpose under this treatment.——*R. P.* states that his Vines are subjected to the heat of a fruiting Pine-stove. Some of them are fruitful, others are not, although apparently producing equally luxuriant wood; they are planted outside, and introduced into the house by holes under the front lights. The first is a Black Hamburgh, with two branches; one branch, which produces thirty bunches, is trained up the rafter, the other runs along the inner side of the front lights, until it reaches the adjoining rafter, up which it is also trained, but it produces no fruit. The White Frontignan is trained up the next rafter; it bears eighty bunches, while the Black Muscat, trained along the front, and taken up the adjoining rafter, is perfectly unproductive. Next follows a Black Hamburgh, that was cut down last year; it is trained in the same way, and bears a good crop on the branch taken up the rafter; they are all pruned on the spur system. [It appears that the upright shoots are fruitful, whilst those trained horizontally are unfruitful. The former should be waved. Has any one seen a similar case?]——*A Paddy*, speaking of Heath edgings, observes, that Heath will grow in any ordinary garden-soil, and that it may be removed at any season. He informs us that he has pulled up young plants from their natural bed in all seasons, and larger plants in flower, all of which succeeded perfectly in the garden; he states that the flowers are as brilliant as if they were produced on their native wilds.

Societies.

BOTANICAL SOCIETY OF LONDON.

Feb. 2.—A. Gerard, Esq., in the chair. Various donations to the Library and Herbarium were announced, including 44 new species of Mosses, collected at Swan River by Mr. J. Drummond.—Read, the commencement of a paper by E. Lees, Esq., being A Synoptical View of the British Fruticose Rubi, arranged in groups, with explanatory remarks. The groups into which Mr. Lees unites the species have been already reported in this journal, in a paper read before the Society last year. The list of species will shortly be published in a new Catalogue of British plants, now in the press, for the Botanical Society of London. The following explanations in the words of the author will sufficiently show that this arrangement has not been founded upon any brief or superficial study of his subject:—"Having previously designated the general groups into which the British Fruticose Rubi are divisible, I now proceed to attempt the more difficult task of describing the species in each group, and tracing them in succession in a synoptical form. In doing this, as I must necessarily propose some alterations, it is advisable that the candid and inquiring Botanist should be informed as to the principles I have kept in view. In the first place, then, I have desired to make no innovation but what seemed imperatively required for correct elucidation; and have, therefore, made every effort to profit by the labours of preceding eminent Botanists who have particularly studied the Rubi, as Sir J. E. Smith, Drs. Weihe and Nees von Esenbeck, Mr. Borrer, and Professor Lindley. But, secondly, I have observed with the eye of an original explorer, tracing every form that appeared to me different, without reference to the ideas of other Botanists. And, thirdly, having observed the same plants in a living state for several successive years, I have collated and revised my original observations, sketched every apparent species, and compared them again and again with the figures, descriptions, and named specimens of Botanists of authority. Thus, I have been enabled, in a great degree, to understand the forms to which particular names have been assigned, and to test their propriety by my own experience; I trust, therefore, that I shall not be considered guilty of assumption when I may differ from others, being only anxious for the nearest approximation to correctness. It is unnecessary for me to go into the question as to what constitutes a species in this genus; for, as I have before hinted, it is not unlikely that the forms in every 'group' may be really only varieties sporting from a normal form, and into each other; but, if Botany be a science of discrimination, it is at any rate convenient to name every remarkable form as a species or subspecies; since, otherwise, minor variations can scarcely be distinguished, or must be placed in the same rank with more important deviations of structure. Indeed, Nees von Esenbeck, one of the authors of the elaborate 'Rubi Germanici,' has well remarked, in a letter to the Rev. Mr. Leighton, in the 'Shropshire Flora,'—'I am not of opinion that all the forms proposed by my friend Mr. Weihe as species are to be considered as such; but, in my opinion, it is absolutely necessary to look for the greatest number of forms which present themselves to us in the genus, before attempting to judge of species, and fixing their limits. I can scarcely tell which is most perplexing in the path of our science, whether,—with Mr. Weihe, to distinguish as species every form of Bramble that presents itself to our view,—or, with Mr. Koch, to consider all as modifications of one only. In this case, I do not doubt that these are matters purely of observation, and that the faithful observer of Nature will find that the truth really lies between the two extremes.'"

LINNÆAN SOCIETY.

March 5.—Edward Forster, Esq., in the chair. Dr. W. H. Milne, of Nottingham, was elected a Fellow.—Mr. T. Hall presented, through Dr. W. H. Brown, a specimen of the eight-banded Armadillo.—Sir W. J. Hooker presented specimens of above 50 species of fruits, the greater part new to the Society's collection, including many rare Coniferæ, from North America and Australia; the flowering scapes and portions of the stems of two species of Xanthorrhœa; the root of a species of Ebony from Madagascar; a specimen of the inner Bark and section of the stem of the Lace-bark tree, &c.—Miss Potts, of Chester, presented specimens of Lepidium latifolium, and of a variety of Erodium cicutarium.—The stem of a Xanthorrhœa was presented by T. W. Mann, Esq.—A paper was read from C. C. Babington, Esq., on the Spiranthes gemmipara. This plant is the Neottia gemmipara of Smith, and was named and figured by him in English Botany from a single specimen found by Mr. Drummond, at Bearhaven, Castleton, in Ireland. During the late meeting of the British Association, Mr. Babington visited the spot where the original specimen was obtained, and found about twelve specimens in flower. The plant was confined to a few spots near the sea-shore, occurring on the drier parts of boggy fields. This species differs considerably from the others of the genus, but more especially in the connection of all the sepals with the two upper petals. The flowers are arranged in three spiral lines, forming a dense spike. The Hybernacula, described in English Botany, are not constant. Two papers were read from W. Griffith, Esq. The first was a description of Cytinus dioicus. It is a native of the Cape, and found parasitic upon Eriocephalus racemosus. It does not, however, injure the plants on which it grows. The second paper was a description of the genus Mystropetalon, which had been referred by Mr. Harvey to the Rhizanths, and to the order Balanophoreæ. The author considered it to be nearly allied to Cynomorium, and that these two genera form a peculiar family of a very distinct kind.

ENTOMOLOGICAL SOCIETY.

Mar. 4.—George Newport, Esq., in the chair. The president announced that the subjects for Mr. Hope's two prizes of five guineas each were,—First, the Natural History of Vesicatory Insects, including an account of all that had been used for the purposes of vesication, with descriptions of the species; and also a chemical analysis of their secretions. Second, the Natural History of the genus Stylops.—Mr. Stephens exhibited several specimens of rare insects, and amongst others a variety of Melitæa Euphrosyne, taken a fortnight earlier than usual for this species.—Mr. Westwood exhibited a variety of Arctia Chaa, with larger wings and antennæ than usual; also the cocoons of a species of Ichneumon, attached to a piece o

cord, and from which the insects escaped at either end.—Mr. Doubleday exhibited a new species of Polyommatus, from the Missouri.—Four species of Papilio, from Assam, were exhibited, two were new, and the other two had not yet been figured.—Mr. Westwood exhibited specimens of an orthopterous insect, in which the leg had been reproduced after having been broken off. The new leg was distinguished from the others by its smaller size, and the absence of the warty projections which exist on the old ones. He believed that no reproduction of parts took place in those insects which undergo what is called perfect metamorphosis. The antennæ of the larvæ of Raphidia had been reproduced, but this genus must be looked upon as having an imperfect metamorphosis, as the pupa moved when touched, some days before it passed into the imago state. Mr. Westwood also read a paper on the economy of the genus Palmon. This genus belonged to the Ichneumonidæ, and a species of it had been described by an anonymous writer in the "Entomological Magazine," as attacking the eggs of a species of Mantis. The eggs of the Mantis are covered over with a woolly case, which however did not prevent the Palmon from depositing its ova in the case. This fact the author considered was opposed to the opinion expressed by Mr. Curtis in his paper on the cocoons of the larvæ of Dieloceras Ellisii, which he supposed were covered with wool to prevent the attacks of the Ichneumonidæ. A discussion followed the reading this paper, in the course of which the President observed that he believed the law of the reproduction of parts was the same in all the Articulata. The reason why the limbs of the larvæ of insects undergoing a perfect metamorphosis were not reproduced was, that they died of hæmorrhage from the wound. He referred to Mr. H. Goodsir's observations on the reproduction of the legs of the Crustacea, which Mr. Goodsir had traced to the existence of a gland for the especial purpose. He hoped, however, those observations would be repeated. In the course of the discussion the curious fact was stated that sometimes insects belonging to winged genera failed to develop their wings, and were wingless, whilst sometimes wingless species, of which the too common Cimex lectularia (Bug) was an example, took to themselves wings and begun to fly.

Reviews.

A History of British Fossil Mammalia and Birds has been commenced in monthly Parts by Prof. Owen. The Author proposes "to give a description of the most instructive and remarkable remains of the extinct Mammals and Birds of the British islands; to define their generic and specific characters, so far as they are exhibited by such remains; to deduce therefrom, by physiological comparisons, the habits of the species when living; to trace out their zoological affinities, and to indicate their geological relations, and the order of their occurrence in the fossiliferous strata of Great Britain." We cannot doubt that this will be an important publication, and most acceptable to Geologists. The first Number is executed in the same beautiful manner as Mr. Van Voorst's other works, and the name of Prof. Owen is the best of all guarantees for the value of the information it contains.

A Descriptive List of Perennial Grass-Seeds, by J. Sutton and Sons, Reading, is a single sheet of paper setting forth the kinds of soil best suited for the Grasses and other plants employed in forming permanent pasture artificially. It will be found useful, and may be had upon application to the authors.

A Practical Treatise on Brewing. By William Black. 3d Edition. 8vo. Longmans.

This is a complete account of the process of brewing in the large way, with directions for conducting the operation properly in small households. Among the novel views of the author, we may more particularly mention his opinion, that the quality of malt depends on the soil on which the Barley is grown; and that the bad quality of beer, although no doubt owing very often to other causes, is frequently caused by the unsuspected agency of galvanic influence. For the evidence adduced in support of these views, we must refer the reader to the work itself.

The Natural History of the County of Stafford. By Robert Garner, F.L.S. London. Van Voorst.

There is nothing more likely to excite a taste for the study of natural history than well-written, interesting accounts of local objects. However important lists of plants and animals, and technical descriptions of strata, &c., may be to the advancement of science, they are not things that interest the feelings, and induce persons to embark in their study. Up to this time there have been but few books published on local natural history, embracing all the objects of interest in a particular district. This may have arisen from the want of persons, with time and leisure, who could accomplish such a task. It has, however, been done in the volume before us for the county of Stafford, by Mr. Garner; and few persons could have been found more competent to the task.

The work commences with some history of the eminent men who have been born, or have lived, in the county of Stafford. The geography, meteorology, antiquities, geology, zoology, and botany of the county, are treated of in successive chapters. All these subjects are developed at some length, and the zoological and botanical departments contain general observations of an introductory nature, that will make the volume serve, in some measure, as a text-book for the study of animals and plants. We cannot, however, commend Mr. Garner for arranging his plants according to the Linnæan system. None of the Floras of the whole island are so arranged now, and it will soon be more calculated to puzzle than to assist the student in botany. The Flora of Staffordshire is somewhat northern and subalpine, the surface of the county lying between 700 and 1500 feet above the level of the sea. It is quite deficient in many of the plants very common in the south of England and near London, and comparatively few of the plants of the chalk are found, as Stafford consists principally of the new red sandstone. In addition to the flowering plants, there are lists of the Cryptogamia, which seem to be tolerably full, and much more complete than such lists usually are.

There are interesting accounts of the lead, copper, and coal mines, and also of the Staffordshire potteries. A memoir is added of that extraordinary man Josiah Wedgwood, to whom his country and the world are so much indebted, for extending and beautifying the art of pottery. He was the son of a potter, the youngest of 13 children, and at 11 years old begun to work at his father's business. He was, however, obliged to give up, in consequence of a lameness. In spite, however, of all these difficulties, he by his genius and perseverance obtained that wealth and position which are well known to all.

The work is illustrated with a number of engravings of antiquities, trees, animals, and other objects of interest, and we can but recommend the volume to those who take a general interest in natural history, and especially those who are living in the county of Stafford.—*L. E.*

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

Saxifraga ciliata. Fringed Saxifrage. (*Hardy Perennial.*) Saxifragaceæ. Decandria Digynia.—This plant, of the section Bergenia, and very nearly allied to S. ligulata, is like that species a native of the mountains of Northern India. Dr. Royle speaks of it thus:—"I have had some difficulty in naming this plant, as the published descriptions, as well as the distributed specimens of Wall. Cat. 4492. and figures of S. ligulata, to which it is most nearly allied, do not correspond with one another; indeed, two distinct species pass under that name. The plant, S. ciliata, is found on the Mussooree and Suen Range, at lower elevations than S. ligulata." The plant in the garden of the Horticultural Society was raised from seeds sent under the name of S. ciliata, from the Botanical Garden of Saharunpur. We must remark that Dr. Walpers has a second S. ciliata from India; the latter being S. imbricata of Royle. This is a robust hardy perennial, requiring the same soil and treatment as S. crassifolia; but when planted in the open border it must not have a situation which is damp in winter or fully exposed to the sun in summer. It is easily increased by dividing the old plants, or by seeds, which should be sown, when ripe, in pots filled with sandy peat and a small portion of loam. It flowers about May, in the open border. —*Botanical Register.*

Nelumbium Caspicum. Caspian Nelumbium. (*Stove Aquatic.*) Nelumbiaceæ. Polyadelphia Polygynia.—We are happy to have an opportunity of publishing this, not only for its own sake, but because it affords an opportunity of pointing out the true distinction between the Caspian and Indian Nelumbia. According to M. De Candolle all the Nelumbia found in various parts of Asia are varieties of one species, and this opinion is generally adopted. It is, however, difficult to believe that the deep red Nelumbium of India, with very sharp-pointed petals, such as is figured in the "Botanical Magazine" t. 3916, and elsewhere, can be the same with the blunt-petalled white-flowered plant "found at the mouth of the Volga, near Astrachan, in a part of the river called Tschulpan, amongst reeds intermixed with Nymphæas and Trapa," which, according to Messrs. Fischer and Steven, is the locality of this plant. M. De Candolle indeed suspected that it must be different, but he did not remark in the dried specimens examined by him any character beyond the bluntness of the petals and their general uniformity in size, and upon that distinction he was unwilling to rely. The true difference seems to consist in the very small number of carpels, which do not appear to exceed nine, while in the great Indian species they are as numerous as thirty or thirty-three. Speaking of N. speciosum and its supposed varieties, Dr. Roxburgh writes as follows:—"I have met with only two sorts on the coast of Coromandel, one with rose-coloured flowers, the other with flowers perfectly white, and since that time a third variety has been brought from China with smaller rosy flowers. They grow in such sweet water lakes, &c., as do not dry up during the driest season, and, on the coast, flower all the year round. In Bengal they flower during the hot season, April, May, and June, and ripen their seed about the close of the rains. In China there is a still more beautiful bright crimson variety, which they call Hung-lin; I have hitherto only seen a drawing of it. The white Nelumbium differs in few respects from the red one, and may be considered as only a variety of it. The tender shoots of the roots between the joints of both sorts are eaten by the natives, either simply boiled or in their curries. The seeds are eaten raw, roasted, or boiled. The leaves are used to eat off instead of plates. These holy and beautiful plants are often met with in the religious ceremonies of the Hindoos under their Sanscrit name *Padma*." It is a stove aquatic, requiring to be kept dry during winter. Before putting it into the water, which ought to be done about the beginning of February, it should be repotted in sandy loam mixed with pieces of sandstone, to act on the same principle as drainage, for the water in which it is grown requires to be renewed once or twice a week, and should never be allowed (especially in summer) to be below 80°. About the end of October, when the leaves begin to decay, the pot should be lifted out of the water and dried off gradually. As the soil becomes dry it will crack or leave the sides of the pot, which should be filled up with sand, in order to cover many roots that would otherwise be exposed.—*Botanical Register.*

Miscellaneous.

Age and Extraordinary Size of an Oak.—At about 6 miles W.S.W. of Saintes (in the Lower Charente), near the road to Cozes, stands an old Oak-tree, in the large court of a modern mansion, which still promises to live many centuries, if the axe of some Vandal does not cut it down. The following are the proportions of this king of the forests of France, and probably of all Europe:—

Diameter of the trunk at the ground . .	from 9 to 10 yards
,, At the height of a man	6½ to 7½
,, At the base of the principal branches .	1 to 2
,, Of the whole head	40 to 43
The height of the trunk	8
,, The general height of the tree . .	22

A room has been cut out of the dead wood of the interior of the trunk, measuring from 9 to 12 feet in diameter, and 9 ft. high, and they have cut a circular seat out of the solid wood. They put a round table in the middle when it is wanted, round which twelve guests can sit. A door and a window admit daylight into this new sort of dining-room, which is adorned by a living carpet of Ferns, Fungi, Lichens, &c. Upon a plate of wood taken from the trunk, about the height of the door, 200 concentric annual rings have been counted, whence it results, in taking a horizontal radius from the exterior circumference to the centre of the Oak, that there must have been from 1800 to 2000 of these rings, which makes its age nearly 2000 years. — *Annales de la Société d'Agriculture de la Rochelle.*

An Economical Polish Beverage.—Into sixty quarts of water put three ounces of Elder flowers, five pounds of common brown sugar, one quart of vinegar, and one of brandy; infuse them for three days, stirring them once every day. This beverage, which is mentioned in the "Agricultural Journal of Aix," is quite as agreeable as beer, and costs ten times less.—*Rev. Hort.*, 1843, p. 468.

Tea in India.—The Tea plantation at Kaola Ghir, on the western branch of the Tonse Canal, is, perhaps, the most interesting of all the symptoms of slowly returning animation in the Dhoon. There are to be seen 5000 vigorous plants of the shrub, thriving with a luxuriance unequalled, we were assured by the Malli, Cheyt Ram, and the Chowdrie of the Botanic Gardens, in this neighbourhood, Nanuck, unequalled in any other garden in the country. Many of the plants had blossoms and seeds upon them, and there seems no limit to the extent to which these plantations may be carried within half a dozen years. The increase, this year alone, at Kaola Ghir, by Dr. Jameson's orders, exceeds 3000 plants, and next year it might be 20,000! The best plants are raised from seeds, layering appearing not to be so quick nor so good a process; and these seedlings produce in the third year, a few even in the second, a large crop of seeds, which of course may be employed in extending the plantations. In 20 years, the entire Tea market of the world might be furnished from the Dhoon and similar Indian localities." —*The Hills*, an Indian Paper.

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSES, CONSERVATORIES, &c.

Keep up a moist heat of 75° or 80°, and let the house be rather close, in order to encourage newly-potted plants. Proceed with potting the different tribes as before mentioned; watch carefully over seedlings, and get in cuttings of those plants you wish to increase as early as possible. Now is the best time to strike cuttings.

Conservatory.—Climbers will now begin to spread over this house, and will require particular care in training them regularly at first. Stephanotus floribundus seems rather more hardy than Passiflora Loudoni: both survived in the conservatory here, this winter, in a temperature that averaged 45°; they are now beginning to grow freely. Little syringing should be done here, on account of the bloom; water must therefore be poured on the paths, and any spare places, to keep the atmosphere moist and cool. See that insects are kept down, and that plants have sufficient room. Specimen plants are easily injured at this time, if they are crowded together; all the plants brought in for the sake of their flowers only should be removed as soon as they are out of bloom.

Greenhouse.—Some of the more hardy and common plants in this house might now be turned out to some sheltered place, in order to give more room to the finer kinds. Young plants in small pots might now be potted on the one-shift system; but for this, it is essential that their roots are not much matted, and that they are in a growing state. The only disadvantage in this system is, that after a few years the soil will subside too much in the pot, and many delicate plants will not bear the pots to be filled up again. The best remedy against this, is to place an inverted pot over the drainage, as is often done for Orchidaceæ, and to have it so adjusted, that when you place the small ball on the bottom of it, the top of the ball will be level with the top of the large pot. A small Heath thus treated may safely be trusted in the largest pot: the collar of the plant always remains at the same level at which it is first placed.

Forcing-pits.—Keep every part of these pits full of plants, cuttings, &c.; any plant that can be forced into flower during spring is desirable. The Glycine sinensis is one of the easiest to force in a heat of 55° to 60°; we have it now beautifully in bloom. All the species of Jasmine force well; if they are kept under-potted, and their young wood is constantly stopped in the growing season, they form loose bushes, and give up their climbing habit when they are more manageable for forcing. Honeysuckles might doubtless be treated in the same way. All American plants require large quantities of water when forced. Introduce dry bulbs of sorts to succeed Gloxinias and Achimenes, and sow a few seeds of Balsams, Coxcombs, Browallias, Thunbergias, &c.—*D. B.*

II.—FLOWER-GARDEN AND SHRUBBERIES.

Out-door Department.

The weather has been so exceedingly precarious of late that it is doubtful whether many of the operations already recommended have been performed; therefore look back to former calendars, and bring the work up as expeditiously as possible. Worms are very troublesome this showery weather, but they may be kept in check by watering the turf occasionally with lime-water made from stone lime, or they may be brought to the surface of the ground, and then removed by hand, by watering with a weak solution of corrosive sublimate. The best plan to dissolve this mineral poison is to add its weight of spirits of salts to it. Attend to mowing, sweeping, and everything that tends to promote neatness. Vacant beds in the Flower-Garden will be benefited by being dug over again when they are dry.

Shrubbery.—If it is intended to make any addition of new shrubs or trees in this department they should be got in immediately. Paulownia imperialis is a noble plant, if for its leaves only, and should be planted on every lawn; it will require protection until the stem gets woody; but after that it will probably stand as well as Catalpa syringifolia. Araucaria imbricata is one of the noblest plants we have, and many of the Cedars, Pinuses, and Cypresses—to say nothing of Magnolias—are very beautiful. Continue the covering of tender plants for some time longer. Pinuses suffer more from the destruction of their early spring growths than from any other cause; therefore, endeavour to check them by admitting a current of cold air from the north side, and by keeping the plants shaded on sunny days.

Pits and Frames.—Among the first things to be attended to, especially where a large stock is required for flower garden decoration, is the propagation of Chrysanthemums. Among the new ones which bloomed with me last year, may be mentioned Bijou, Arago, Grand Napoleon, Casimir Perier, Demosthenes, Julius Cæsar, Abelard, Ivanhoe, Minerva, Theress, Marie and Phidias. Several of these are seedlings sent out for the first time last season by Messrs. Chandler, and are really excellent. Pot Tuberoses in 48s. in turfy soil, and place them in a gentle warmth until they begin to grow. They are useful for setting among plants near the windows, or for the decoration of the hall or drawing-room.—*W. P. A.*

III.—FLORISTS' FLOWERS.

Auriculas.—Another class of these flowers, styled Alpines, have made great advances in public favour of late. They are selfs, of all shades, from light pink and grey to dark crimson and deep purple, the eye or centre of the flower being yellow. Joined to extreme hardiness and beauty, they likewise seed profusely. It

is dangerous to grow them in the vicinity of Auriculas with white grounds, if seed is an object, as the humble bee, particularly, will carry the farina from one to the other, and thus "bastardise" the ensuing crop of seedlings. They do not appear to be so susceptible of wet as the Auricula, and certainly are not so fantastic as to situation, flowering and flourishing almost anywhere. They are usually exhibited at spring shows, and cannot be too strongly recommended to the admirer of early flowers. Plants in frames must be watched in rainy weather, taking care that they have no drip; should this be the case, the laps must be puttied the first fine day.

Polyanthuses are now throwing out fibres round the neck of the plant, and growing fast. If increase is more an object than blooms, they may be parted to advantage now. The breed of this class of Florists' flowers requires improvement, and has made less progress during the past twenty years than any of the others.

Tulips ought to be protected from heavy soaking rains, as well as sharp frosty winds, which we may yet expect; and the directions given in previous Calendars must be strictly attended to.

Carnations.—From correspondents in various quarters I learn that there are great quantities of seedlings throughout the country; and as cross-breeding is now better understood and acted upon than formerly, we may confidently expect some valuable additions to this deservedly popular flower.

Ranunculuses.—Since beds have been planted we have had heavy wet; they should be protected with mats, as the roots are susceptible of frost when swelling, which often occurs after much rain at this time of the year. Keep seed-pans moderately moist.

Dahlia cuttings, that are rooted, may be potted off in light vegetable or leaf-soil, and put in close frames till they get fresh hold.

Pansies.—Young plants put out in beds last autumn will flower better than those planted in spring. Where additions are requisite, they should be made now, taking care in the purchase of them that you get the roundest flowers, with the colours as well defined as possible; the smoother and thicker the petal the better, and the ground or body colour of one shade, and perfectly clear; bearing in mind that white tinged with yellow, or yellow stained with orange, will not now do.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pinery.—THE plants in fruit may now have an atmosphere of 70° by night, and 75° by day. Give air when at 85°, and shut up at 95°, dewing the plants directly after with a fine-rosed syringe. Sprinkle the plants lately potted, morning and evening, and continue to shade those that have been disrooted.

Vinery.—Look over the earliest Grapes again, to see if any of the bunches are too thick, in which case, remove as many berries as is necessary, to give room for those that are left to swell without pressing against each other. It is necessary that syringing should be discontinued whenever the fruit begins to ripen; a drier atmosphere and more air will assist in giving it flavour and colour. Attend well to the stopping and tying of the shoots in the second house. The late Vines will now be swelling their buds, and where there are long rods of last year's growth, bend them so as to have the lowest buds on the shoots considerably higher in the house than those near the points; and as the lowest buds break, keep raising the shoot gradually till all are broken.

Peach-house.—In thinning finally the fruit on the trees in the first-house, it will be proper to leave only one fruit upon a shoot of last year's growth (excepting where very strong) if the crop has set well and there is sufficient choice; but in thinning Peaches much depends on the crop being regular over the tree and the degree of vigour the tree may possess. One good fruit in a square foot would be sufficient for a tree in a medium state as to vigour, but more than this should be left till after the stoning. Weak branches should not be allowed to bear any fruit. If the fruit in the second house has set too thick, it will now require a partial thinning. Tie in the shoots in good time, and keep the syringe in use twice a day, and few insects will trouble you.

Cherry house.—Where the fruit is swelling keep the night temperature at 55° or 57°. With sunshine give air early shut up at 80°, and syringe immediately. Be careful to destroy all insects before the fruit begins to ripen, as you cannot syringe or fumigate afterwards.

Fig-house.—The Figs now ripening should be kept dry, and as they are liable to red spiders, use flower of sulphur on the foliage till you can resume the use of the syringe. It is hardly necessary to say that those plants in pots that have much fruit upon them, should be assisted with liquid manure.

Strawberries.—The whole of the plants in pots for forcing would be benefited by a top dressing of some rich soil, or very rotten dung, and if they are under cover, they will occasionally require watering with liquid manure. Keep those now swelling off their crop in the houses free from insects, and bring in a succession once a fortnight.—*G. F.*

V.—HARDY FRUIT AND KITCHEN GARDEN.

Apricots and Peaches.—Proceed with the pruning and nailing of these as expeditiously as the weather will permit. If cut too soon, an access will be given to the frost, which will induce gum and canker in unfavourable situations. Daub all wounds, especially large ones, with thick paint. Anoint Peaches with a mixture of clay, soot, sulphur and lime, adding soft soap and tobacco-juice, if you think necessary. The great use of such painting is to cover, and thus prevent the hatching of the eggs of insects. For this purpose nothing is better than pure clay, well wrought up; soot and sulphur, if they do not nourish the buds, keep off birds; and lime gives the mixture a lighter appearance, than if soot alone were used, which helps to keep the shoots in a more equal temperature, by day and night.

Cauliflower.—Sow in a slight hotbed for succession. It is best to sow little and often. A regular supply is thus obtained, and no superabundance.

Celery.—Sow in a slight hotbed, or under a hand-light. Prick out in pots what was previously sown.

Tomatoes and Capsicums.—Sow in heat to get them forward, as otherwise they do no good in unfavourable places.

Herbs.—Prepare for transplanting these where necessary, and get ready ground for annual sorts. Above all, forget not Parsley, and plenty of it.

Onions, Carrots, &c.—Prepare the ground for at least partial sowings of these crops. Those having wet stiff soils, must watch their chance.

Cucumbers.—Keep up the temperature; sprinkle the sides of your pit, or frame, after a sowing-day; stop, peg, or tie down shoots; impregnate fruit-blossoms as they appear, as the fruit swells faster in consequence.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—Attend to the directions given in preceding Nos., and proceed with the same work where it is not finished.

Coppice.—Proceed with what has been previously recommended to be done here.

Young Plantations.—Continue to put the fences in good order. Cut and plash hedges, where that has not been done, as directed last week, and attend to what has formerly been stated under this head.

Hedge rows.—Continue to plant and train young trees, repair and make new fences where they are required, secure trees from being injured by cattle, and protect newly-planted ones from strong winds.

Nursery Work.—From the continued unfavourable state of the weather, little can be done in this department. Thin out the strongest side-branches where they are too numerous, and train young plants to one upright leader. When the weather becomes milder, digging, planting, or sowing will be performed with more advantage than when the ground is wet and not in a proper state.—*W. B.*

VII.—COTTAGERS' CALENDAR.

As the season for grafting is at hand, the appearance of Thorn-hedges may be much improved by grafting the scarlet and other varieties on the top shoots. These should be allowed to grow up at different distances along the hedge, which should be regulated according to the size of the garden, and the taste of the cottager. A few hardy Roses may also be planted in the fence, and trained in it. When these are in bloom, the blossoms projecting a little out from the hedge, only appear, and render it very ornamental. Some of the Roses might also be budded on tall stocks above the top of the hedge as Standards.

Vegetables.—This is an important time for getting in crops of several kinds; ground should be in readiness for Onions, Carrots, &c., which should be sown in drills as soon as the weather will permit. Of the former, the Strasburgh and James's keeping are good kinds. Make up deficiencies in Cabbage-rows, and sow a small patch for succession in a warm border. The Vanack is as profitable a kind as any. Of Potatoes a few of the Ash-leaved Kidney may be planted for an early crop.

Fruit.—See that all Standards are now pruned, and that the training of wall-trees is finished; this is a good time for grafting Apples, Pears, &c.

Flowers.—As bulbs are all above ground, flower-borders may now be forked up, giving them a dressing of leaf mould or rotten dung. Herbaceous plants that are spreading too much should be divided, so as to occupy less room. Everything about the cottage should be trimmed up, and kept neat, as this is always a mark of taste and industry.—*McH.*

State of the Weather at Chiswick during the last 18 years, for the ensuing Week ending March 23, 1844.

Mar.	Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp	No. of Years in which it Rained.	Greatest quantity of Rain.	Prevailing Winds. N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.

March 8th—Slight frost early A.M.; very fine; overcast at night
9th Densely and uniformly overcast; cloudy and mild; overcast
10th Constant heavy rain commenced half-past six, continuing till noon; fine, clear, and boisterous at night
11th Boisterous, with rain, cold stormy showers, and very boisterous throughout; clear at night
12th Very clear; at noon boisterous, dark and stormy, with sleet; clear
13th Clear, with slight frost; dark clouds; clear at night
14th Uniformly overcast: rain; dense fog in afternoon; rain at night
Mean temperature of the week, 1 3 deg below the average.

Notices to Correspondents.

MR. PAXTON'S COTTAGER'S CALENDAR.—At the earnest solicitation of many of our Subscribers, we have determined on again reprinting Mr. Paxton's "Cottager's Calendar," in the form of a small volume, for general distribution, price 3*d.* each copy. It may be ordered of all booksellers. Gentlemen wishing to *distribute copies* among their cottage tenantry, may have them *delivered in any part of London*, by remitting a post-office order to this office, at the rate of 5*s.* for every 25 copies.

APRICOTS.—*T. Barnes.*—The Moorpark is one of the best Apricots for a south wall.‖

ASPARAGUS.—*Omega.*—Your plan of proceeding with the land to be converted into a garden, is unexceptionable; but there ought not to be any need of guano for the Potato crop. We should avoid that expense. In cultivating Asparagus we advise you to observe, as nearly as you can, the method employed in Biscay, as described by Capt. Churchill, at p. 187, for 1842. But you may employ guano with advantage, instead of the Spanish manure, provided you mix it with an abundance of soil, or with common stable manure. Potter's guano or superphosphate of lime may be given afterwards, when the plants are in full growth. The grand point with Asparagus is to get the summer growth excessively strong: the spring shoots will be large in proportion. We should be never satisfied with Asparagus till its summer shoots were at least 6 or 7 feet high. In planting Sea Kale you have nothing to do but get two-year old plants, manure them richly, adding a good dressing of salt, and cut them every other year. If you cut them every year you will weaken the shoots too much.——*C. J.*—When your Asparagus makes its summer-shoot, give the beds weekly a dressing of salt and guano, dissolved in water, at the rate of ½ a cwt. of salt, and the same quantity of guano per acre, and continue the dose for six weeks. Gas-water, or sulphate of ammonia, will kill Moss, and make Grass grow; apply them in April. Potter's guano and superphosphate of lime have both an extraordinary effect on Asparagus; but we do not know that they will kill Moss on Grass land.

AVIARIES.—*M. E.* inquires what birds would do best together in a garden aviary 17 feet by 12. Perhaps some correspondent will say. Nothing will do better for warming it than passing a couple of hot-water iron pipes through it; which may be heated by such a small boiler as Stephenson's. There is a single white Hepatica, but we are unacquainted with a double white.

BOOKS.—*A. G.*—Lyell's Geology, unless you should prefer Mr. Ansted's, now in course of publication.

CHARCOAL.—*T. B.*—Charcoal having been found not to disagree with plants of various kinds to which it has been applied as a manure, its introduction into compost for the growth of Cucumbers is worthy of trial.‖

COMPOST FOR CARNATIONS.—*A Beginner.*—Carnations require a light rich soil, consisting of turfy loam, well-rotted hotbed manure, with a portion of leaf-mould, and a little grit, or coarse sand. Broken pots form the best material for drainage.*

COVERINGS FOR FRAMES.—*R. W. B.* states that he has tried the composition recommended at page 893 of last year's *Chronicle*, and although he followed the directions exactly, he found it required a long time to dry. We have communicated with "M. E. H." on the subject, who says he did not experience any difficulty in this respect; that his covering, which is 30 ft. long and 10 ft. wide, was coated with the preparation one day, and was dry enough for fixing on the roller and putting in its place the day following. He cannot account for "R. W. B.'s" want of success, unless it was owing, perhaps, to a difference in the quality of the materials employed. The only remedy he thinks, in case of "R. W. B." making another trial, would be to add a small quantity of litharge, such as painters use for drying their paint, and no doubt it would have the desired effect.

CUCUMBERS.—*A Subscriber.*—In order to check mildew upon these, remove the worst of the leaves, dust the remainder with sulphur, and keep your frames warmer at night than you have been accustomed to do. Flowers of sulphur will also kill Thrips; let it remain on the leaves for a few days, and then give them a good washing with the syringe.‡

FRUIT-TREES.—*J. N.*—The following are good dessert *Apples*:—Early Harvest, Pearson's Plate, Golden Reinette, Golden Harvey, Court of Wick, Reinette du Canada, Court-pendu Plat, Boston Russet, Sturmer Pippin. For Kitchen use—Dumelow's Seedling, Alfriston, Bedfordshire Foundling, Dutch Codlin. *Pears*—Marie-Louise, Beurré Bosc, Hacon's Incomparable, Glout Morceau, Passe Colmar, Thompson's Winter Nelis, Beurré Rance; and, for Baking, the Catillac. *Plums*—Royal Hâtive, Reine Claude Violette, Kirke's Washington, Coe's Golden Drop ‖

FUCHSIAS.—*W. G.* — Exoniensis, Formosa elegans, Robusta, Venus victrix, Colossus, Splendens, Conspicua arborea, Kentish Bride, Pontey's Tricolor, Insignis, Reflexa, and Miller's Constellation.*

GOOSEBERRIES.—*D.*—The following varieties are distinguished for rich flavour rather than large size:—Red Champagne, Red Turkey, Keen's Seedling Warrington, Early White, Woodward's Whitesmith, Hebburn Green Prolific, White Fig, Pitmaston Green Gage, Yellow Champagne, Taylor's Bright Venus, Red Warrington, Rumbullion. Nurserymen in the county in which you reside will most likely be able to furnish all, or most of the above. ‖

GRAPES.—*D. R.*—The London Nurserymen having informed you that they have sent out all their disposable stock of the Black Muscat of Alexandria and Charlesworth Tokay, we cannot inform you where these rather scarce sorts of Grapes are to be procured.‖

GUANO.—*R. W. B.*—We should prefer applying guano in a liquid state to Carnations, rather than mixing it with the compost, or as a top-dressing; 4lbs. of guano to 12 gallons of water will be found a good proportion; it should remain for 24 hours before being used; the same guano will do for mixing again with the same quantity of water after the first is drawn off.—*M. E. H.*

HEATING.—*Walberton.*—If you want air-heat, slate tanks are best. If bottom-heat is your object, we cannot at present advise you to use slate, except for the tops.——*P. Tomkins.*—The best mode of securing the joints of hot-water pipes is by means of tar-rope untwisted and thick red-lead. Probably your joints are badly packed.——*R. B.*—The smallest boiler you can get. Wait a little, and perhaps you may find the plan of one to your mind in our columns.

JONQUILS.—*A Subscriber.*—The reason why your Jonquils do not flower freely arises from their leaves being cut off in summer while they are in a green state. The bulbs should be taken up when the foliage has become yellow and dried. If they are allowed to remain in the ground all the year they generally become exhausted, and do not flower freely. They require to be kept rather dry in winter. ¶

MAGNOLIAS.—*M. grandiflora* and its varieties are the only evergreen Magnolias. The two best others are M. acuminata and macrophylla. Your other question has been often answered in former columns.

MANURES.—*Este.*—As far as our experience goes, Potter's guano beats everything. Three or four cwt. an acre are sufficient. Whether such manures can be advantageously applied year after year, remains to be seen. We apprehend it will eventually be found useful to mix them with stable litter, which they will render very powerful, because of the mechanical action of the litter.——*Herts.*—We cannot tell what No. 2 is good for. No. 1 is not guano, but *rubbish.*

NAMES OF FRUITS.—*P. Q.*—Your Apples are: 9, Top Apple; 23, Beauty of Kent; 29, (perhaps) White Costin; 37, Blenheim Pippin; 41, Kentish Fill-basket; 43, Holland Pippin.‖——*T. Barnes.*—Your Apples are a variety of Codlin.‖——*P. W. M.*—The Apple you sent, of a green colour, with a thick russeted base, and which you state is called "Little Herbert" or "Harbord," is not known by any other name.‖

NAMES OF PLANTS.—*Indiana Meta.*—Trapa bicornis is a tender aquatic, requiring the same management as a greenhouse Water Lily.——*A. M.*—A Tradescantia, and perhaps T. crassifolia.——*A Beginner.*—Schinus Molle.——*J. C. L.*—Oncidium pubes.——*J. H. G.*—Apparently, some male Chenopodiaceous plant, but we are unacquainted with it; neither do we know such a Gladiolus as you mention.—— *G. R.*—Bæobotrys argentea.——*M.*—The Ipomœa is new. It will, however, we fear, travel badly, and therefore be hardly worth exhibition.——*C. M. S.*—Apparently some Juniper: probably the common one.——*L. B.*—1, Erica Westcotii; 2, E. colorans; 3, Diosma capitata.

PANSIES.—*W. G.*—Brown's Curion, Maid of the Mill, Cook's Mulberry superb, Sulphurea elegans, Pearson's Black Prince, Major's Bridegroom, Thompson's Eclipse, Miss Stainforth, Ultra-flora, Corona, Jewess superb, King's Exquisite.*

PEAS.—*R. S.*—The "British Queen," the same as Knight's Tall Marrow Pea, grows to the height of 6 or 8 feet. Some of it may be sown now, and more in the end of May, for a late crop.‖

PRESERVING BLOSSOMS.—*A Subscriber.*—Garden-mats are not fit for sheltering the blossoms of fruit trees. You should employ some material that allows the light to pass through, and hang it an angle of 80°. Very coarse canvas will do.

ROSES.—*T. S.*—Perpetual Roses, if for free standards, should be cut back much; if trained on walls or trellis, only down to the ripe wood.

WILLOWS.—*Caledon.*—There is no objection to your soil, if it is not dry. You had better get cuttings of the best sorts from the neighbouring osier-grounds, for we doubt whether you can procure them easily by the Botanical names. Salix viminalis and triandra are considered the most useful for fine work.

MISCELLANEOUS.—*J. C. L.*—No one knows what the Spread Eagle is.——*A Beginner.*—We really cannot answer such a string of questions. The reply would occupy half a column. Besides, you will find nearly all your inquiries answered on former occasions, and must search for yourself.——*Goryn.*—The Cedar of Lebanon strikes as freely as the Deodar, if the cuttings are taken from a young and vigorous tree.¶ —— *Aliquis.*—A hotbed, by having the litter mixed with tan, will continue in heat longer; but the tan will render the litter useless as manure. Leaves are best for the purpose.‡ —— *Senex.*—Common manures, as far as we know, make the best dressing for Cauliflowers.‡ —— *H.* is answered in last week's paper, p. 152.‡——*Guichenet* may cut down the flower-stems of Hyacinths, when the flowers have died off them; but the foliage should be left until it becomes yellow and withered.‡——*T. B.*—You should consult some of the classed Catalogues of Roses, and our former pages. It is impossible to fill space with such long lists as you ask for, and which have been given already.——*A. B.*—The cause is probably cold and damp, either of the atmosphere or roots.——*J. B.*—Train Clematis flammula to the posts of your pigeon-house. ——*S. T.*—The front of your pit is *a* on the section. There plant your Melons, and train them on a trellis near the glass.‡ ——*G. P.*—Please to send your address to the office.——*J. R.*—Galangale is the underground root-stock of Alpinia Galanga, a plant allied to Ginger, and harmless.——*A Subscriber.*—We do not know where the Trinidad Pine is to be seen; it is not at all like the Cayenne Ils.——*Guichenet's* letter is sent to Mr. C. H.——*J. M'I.* is requested to forward his address.—— *A. B.*—Oranges may be whip grafted in the common way.‡ ——*T. M.* will find directions for the management of Orchidaceæ given at p. 119, 1843. ‡——*Vigil.*—The Cærulean Willow is Salix alba.

SEEDLING FLORISTS' FLOWERS.

CINERARIAS.—*J. and T. G.*—The flower of your blue seedling is small, and the disk too large in proportion to its size; the colour, though good, is not uncommon. The rosy-lilac variety, with broad well-formed petals, is a much better flower; the colour is pleasing, and if the flower expands well (which it has not done in water), it will prove a desirable flower.*——*W. P. W. R.*—Your seedling is a fine-coloured and bold variety; the petals are a little too pointed, but the flower opens well, and is large and showy *

*** As usual, many communications have been received too late for answering this week.

PASTURE AND LAWN GRASSES of the Finest Quality, selected for every description of soil, consisting of Poas, Fescues, Gold Grass, Meadow Foxtail, &c., with a moderate supply of Clover, will enable Noblemen and Gentlemen to lay down upon very reasonable terms. Particulars of quantities suitable to various soils to be had, with an estimate of the cost per acre, by application to WARNER and WARNER, Seed-merchants, 26, Cornhill, London. Genuine Italian Rye-Grass, Mangold Wartzel, and superior selected Turnip-Seeds.

TO BE SOLD, a Handsome Short-Horned Bull, named "Marengo," roan, calved Sept. 4, 1840, (bred by Mr. Whittaker, by the Prince of Northumberland, dam by Norfold (23,772), Medoro by Ambo (1636), g. g. d. Blossom by Memnon (2295), g. g. g. d. own sister to Isabella by Pilot (496), g. g. g. g. d. by Agamemnon, g. g. g. g. g. g. d. by Burrell's bull. He obtained the first prize at Glastonbury Cattle Show, in 1842. To be seen at Calcott, near Bridgewater, by application to Mr. Thomas Jones, at that place, or Mr. Joseph Latch, Newport, Monmouthshire.

The Agricultural Gazette.

SATURDAY, MARCH 16, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, Mar. 20. Agricultural Society of England.
THURSDAY, Mar. 21. Agric. Imp. Society of Ireland.
WEDNESDAY, Mar. 27. Agricultural Society of England.
THURSDAY, Mar. 28. Agric. Imp. Society of Ireland.

FARMERS' CLUBS.

March 25 Chepstow.
March 29 Hadleigh. Wrentham. Debenham. Stoke Ferry. Grove Ferry.
March 28 Richmondshire.
March 30 Gloucester. Cardiff.

THE CULTIVATION OF THE PARSNIP resembles that of the Carrot in every essential point. The land should be prepared as stated last week for the Carrot. Especial care should be taken in this, as in that case, to have a deeply-cultivated soil. In the Channel Islands, where this root is largely grown, it is customary in the preparation of the land to use the large trench plough,* and bury the manure—20 tons per acre of stable manure—12 or 14 inches deep. This is of course only practicable on deep soils, and it is on such, whether light or heavy, that this root flourishes. Parsnip seed may be damped, mixed with sand, just as in the case of the Carrot, and drilled early in April at the rate of 4lbs. per acre, in rows on the flat, 18 inches apart. New seed only should be used. Colonel le Couteur informs us, in the Journal of the English Agricultural Society, that seed sown in 1838 would not vegetate in 1840, though soaked and sown in a greenhouse. The damping of the seed, though we have advantageously adopted this plan in the case of the Carrot, for the last three years, is to a certain extent hazardous. Seed thus sprouted, if sown on a dry soil, is liable to be deprived of life. After having been thus treated it must not be sown till the land is damp. The summer culture of the Parsnip is just the same as that of the Carrot. An average weight of from 9 to 11 tons per acre is obtained of it in Jersey. We have not had much experience in the field culture of this root, but we are inclined to think that however superior it is to the Carrot in quality, *i. e.* per cwt., the superiority in the weight of the latter crop renders the Parsnip inferior to it per acre. It is most excellent food for Cows, imparting a rich flavour to the milk, and it possesses extraordinary feeding properties when given either to oxen or Pigs. It should be steamed for the latter; and when thus treated it is a nourishing food for poultry also.

EVERY farmer is aware, that where old pasture land has been broken up, and is again laid down to Grass, many years elapse before it recovers its original productiveness. This arises from the destruction of a LAYER OF MOULD immediately below the turf, which, whatever the colour and composition of the subsoil, is invariably black, composed of very fine particles, and destitute of pebbles, however numerous they may be near the surface in the adjoining arable land. What is the origin of this layer of fine earth? It is generally called vegetable mould, and is supposed to have resulted from the decay of the roots of the Grass. In a paper communicated to the Geological Society in 1838, Mr. Darwin has adduced strong arguments for its being of animal origin, and composed of the accumulated excrements of the earth-worm, usually denominated worm-cast. It is a prevalent opinion among farmers that mineral manures, such as lime, chalk, and burnt clay, have a tendency to sink in the soil. If Mr. Darwin's views are correct, it would appear that, instead of these substances sinking, the mould is raised over them by the agency of the worms.

His attention, he says, was first drawn to the fact by Mr. Wedgwood, of Maer-hall, Staffordshire, who showed him several fields, some of which, a few years before, had been covered with lime, others with burnt marl, and cinders. These substances, in every case, are now buried to the depth of some inches beneath the turf. Three fields were examined with care. The first consisted of good pasture land, which had been limed without having been ploughed, about twelve years and a half before. The turf was about half an inch thick, and two inches and a half beneath it was a layer or row of small aggregated lumps of the lime, forming at an equal depth a well-marked white line. The soil beneath this was of a gravelly nature, and differed very considerably from the mould nearer the surface. About three years since, cinders were likewise spread on this field; these are now buried at the depth of one inch, forming a line of black spots parallel to and above the white layer of lime. Some other cinders which had been scattered on another part of the field, were either still lying on the surface, or entangled in the roots of the Grass. The second field examined was remarkable only for the cinders being now buried in a layer nearly an inch thick, three inches beneath the surface. This layer was in parts so continuous, that the superficial mould was only attached to the subsoil of red clay by the long roots of the Grass. The history of the third field is more complete. Previously to 15 years since, it was waste land; but at that time it was drained, harrowed, ploughed, and well covered with burnt marl and cinders. It has not since been disturbed, and now supports a tolerably good pasture. The section here was—turf, half an inch; mould, two inches and a half; a layer, one and a half inch thick, composed of fragments of burnt marl (conspicuous from their bright red colour, and sometimes of considerable size, viz., one inch by half an inch broad, and a quarter thick), of cinders, and a few quartz pebbles mingled with earth; lastly, about four inches and a half beneath the surface was the original black peaty soil. Thus, beneath a layer (nearly four inches thick) of fine particles of earth, mixed with some vegetable matter, those substances now occurred which, 15 years before, had been spread on the surface. Mr. Darwin states that the appearance, in all cases, was as if the fragments had, as the farmers believe, worked themselves down. It does not, however, appear at all possible, that either the powdered lime, or the fragments of burnt marl and the pebbles could sink through compact earth to some inches beneath the surface, and still remain in a continuous layer. Nor is it probable that the decay of the Grass, although adding to the surface some of the constituent parts of the mould, should separate, in so short a time, the fine from the coarse earth, and accumulate the former on those objects which so lately were strewed on the surface. Mr. Darwin also remarked that, near towns, in fields which did not appear to have been ploughed, he had often been surprised by finding pieces of pottery and bones some inches below the turf. On the mountains of Chili, he had been perplexed by noticing elevated marine shells covered with earth in situations where rain could not have washed it on them.

Mr. Darwin likewise records the following circumstance, communicated to him from Staffordshire, respecting two fields:—1st. In the spring of 1835, a boggy field was so thickly covered with sand, that the surface appeared of a red colour; but the sand is now overlaid by about three quarters of an inch of soil. 2d. About 80 years ago a field was manured with marl, and it has since been ploughed, but it is not known at what exact period. An imperfect layer of the marl now exists at a depth, very carefully measured from the surface, of 12 inches in some places, and 14 in others, the difference corresponding to the tops and hollows of the ridges and butts. It is certain that the marl was buried before the field was ploughed, because the fragments are not scattered through the soil, but constitute a layer, which is horizontal, and therefore not parallel to the undulations of the ploughed surface. No plough, moreover, could reach the marl in its present position, as the furrows in this neighbourhood are never more than eight inches in depth. The preceding cases have shown that three inches and a half of mould had been accumulated in 15 years; and in this case within 80 years (that is on the supposition, rendered probable from the Agricultural state of this part of the country, that the field had never before been marled) a bed of earth had accumulated averaging 13 inches in thickness.

The explanation of these circumstances which first occurred to Mr. Wedgwood, although it may at first sight appear trivial, Mr. Darwin does not doubt is the correct one; namely, that the whole is due to the digestive process by which the common earth-worm is supported. On carefully examining between the blades of grass, in the fields above described, the author found that there was scarcely a space of two inches square without a little heap of the cylindrical castings of worms. It is well known that worms swallow earthy matter, and that having separated the serviceable portion, they eject at the mouths of their burrows, the remainder in little intestine-shaped heaps. The worm is unable to swallow coarse particles, and as it would naturally avoid pure lime, the fine earth lying beneath either the cinders and burnt marl would, by a slow process, be removed and thrown up to the surface. This supposition is not imaginary; for in the field in which cinders had been spread out, only half a year before, Mr. Darwin actually saw the castings of the worms heaped on the smaller fragments. Nor is the agency so trivial as, at first, it might be thought; the great number of earth-worms (as every one must be aware who has ever dug in a Grass field) making up for the insignificant quantity of work which each performs.

On the above hypothesis the great advantage of old pasture land, which farmers are always particularly averse from breaking up, is explained; for the worms must require a considerable length of time to prepare a thick stratum of mould by thoroughly mingling the original constituent parts of the soil, as well as the manures added by man, and of the peaty field about three inches and a half had been well digested in 15 years. It is probable, however, that the process is continued, though at a slow rate, to a much greater depth; for as often as a worm is compelled, by dry weather or any other cause, to descend deep, it must bring to the surface, when it empties the contents of its body, a few particles of earth.

Mr. Darwin was prepared for the formation of a bed of earth by the digestive process of small animals, from what he witnessed in the coral islands of the Pacific. He there saw through the deep clear water multitudes of fishes of the genus Sparus browsing on living corals, like herds of grazing quadrupeds, and, on opening their bodies, he found their intestines filled with a substance resembling impure chalk. From this he was led to the opinion that much of the soft white mud found at the bottom of the sea near coral reefs had passed through the intestines of fishes, and other portions through those of worms, by which the stony masses of the coral are everywhere bored.

The above statements and opinions of Mr. Darwin on the formation of the mould of pastures are laid before our readers in the hope that it may lead them to make observations on the subject and to bring forward other cases similar to those which have been described. If it shall be established by more extended observations this will be only one out of the many instances in which the operations of Nature present to our view important results, produced by the most insignificant agents, which make up by their numbers and incessant activity for their individual weakness. The poor despised "worm of the earth," the very emblem of weakness and vileness, is, perhaps, one of the farmer's best friends, for it appears highly probable that every particle of the surface soil has passed through the intestines of worms. The Agriculturist, as Mr. Darwin has observed, in ploughing his land, follows a method truly natural, and he only imitates in a rude manner, without being able to bury the pebbles or to sift the fine from the coarse soil, a work which Nature is daily performing by the agency of the earth-worm.—*E. W.*

ON FEEDING FARM-HORSES.

IN this part of the country, the following plan of keeping farm-horses is generally adopted:—As soon as there is a sufficient bite (which is not usually the case till the middle or end of May), the horses are turned out to grass at nights, and receive their usual allowance of corn,—3 feeds of a gallon each, and perhaps a little Hay during the day. This management continues till the Clover is ready for cutting, a bunch of which is substituted for the mid-day feed of Corn. When the Turnips are all sown, and the hard work consequently over, most farmers reduce the allowance of Oats, and give Clover instead; and in the early part of harvest, when horses are generally quite idle, they often get no Corn. When the leading-in of the crop commences, they are again put upon Corn; and, as the Clover is then generally all consumed, they receive Tares instead, as their mid-day meal, and when these are finished, Corn or Hay. During all this time, the horses have been constantly turned out at nights; but about the middle of October, or whenever the weather becomes chilly or unsettled, they are kept in the house, and they now receive full feeding, *i. e.*, 3 feeds of Corn per diem, and Hay *ad libitum*. This management is continued throughout the winter; but most farmers, during the short days, give Oat or Wheat-straw instead of Hay for two or three months, generally those of November, December, and January.

Throughout the winter, too, most farmers give boiled or steamed Barley at nights, twice or thrice a week; of this, each horse gets about 2 gallons. To such horses as will eat them, one or two Swedish Turnips are also given once a day, which tends greatly to keep them in condition.

When Whitsunday again comes round, the horses are put out to Grass, as I began by describing. Although there are many little differences in practice, yet the above is the general management of farm-horses in this county, and, indeed, throughout all the southern counties of Scotland.—*A. J. Roxburghshire.*

P.S. I should mention that the working hours are, in spring, summer, and autumn, from 6 o'clock till 11, and from 1 till 5. In the winter months they are from daylight till dark, with an interval generally of an hour, or an hour and a half as the days lengthen.

ON MINERAL AND INORGANIC MANURES.

No. X.

BY PROFESSOR CHARLES SPRENGEL.

There are also cases where marl may improve vegetation by containing protoxide of manganese. It is the humic

* See paper on this subject by Colonel le Couteur, in the 2nd. of the "English Agricultural Society's Journal."

acid, by which it is carried into the plants, and here again the importance of the latter substance is seen.

The clay of marl is especially useful to such soils as are subject to drought, because a soil may contain all the substances required for the nourishment of plants in sufficient quantity, and still be unproductive, if it is deficient in water, which has to convey the nutritive substances into them; and clay retains water for plants in dry weather. Besides that, the alumina of the clay, which has a great affinity for humic acid, will also somewhat decompose the coal of humus and the vegetable matter of the soil. It is also to be remembered, that alumina, the protoxide of manganese, lime and magnesia, potash, soda, and the oxide of iron of the marl will equally prevent the decomposition and useless volatilisation of the humic acid, as these substances fix it chemically.

Marl also improves vegetation by the silica which it contains, *i. e.*, in those soils which are deficient in this substance, for instance moor, peat, or marshy soils. The sorts of marl which are very rich in lime, and at the same time sandy, improve clayey soils by loosening them.

If marl contains (which is sometimes the case) sulphuret of iron, it will be converted, by contact with air, into sulphate of the oxide of iron, which again becomes decomposed by the carbonate of lime, so that gypsum will be formed, which will naturally increase the manuring quality of the marl, as we shall see hereafter.

Marl, however, contains at times a substance detrimental to vegetation, viz., carbonate of the protoxide of iron. I have found this to be the case in two instances. Such marl is generally found under marshy soils, and contains remains of fresh-water shells. In using this sort of marl we must guard against ploughing it under too soon; it must be spread and left lying on the ground till the protoxide of iron has been changed into oxide of iron, which will be seen by its grey colour having changed into yellow, which, however, will take up sometimes a whole summer. If a marl containing much carbonate of the protoxide of iron is ploughed under too soon, the humic acid of the soil will combine with the protoxide of iron into a salt, which is very noxious to plants. Carbonate of iron will, like carbonate of lime, effervesce if acids are poured upon it, and this may lead us into error when calculating the amount of lime which a marl may contain. From the different statements I have made about the action of marl, it will have been seen that it is not merely the carbonate of lime or the clay which constitutes its worth as a manure; still, generally speaking, those sorts are considered best which contain most of the former substance. It is, therefore, mostly tested only as to the amount of carbonate of lime it contains, but it would be as well to take notice of all its other component parts.

The question, how long will marl act? has been often raised. If, however, we consider that it supplies the plants with different nutritive substances, which occur in it in very different proportions—that these substances are taken hold of by plants in very different degrees—that many of these ingredients are carried away by rain or snow-water; if we consider, in short, that plants are also deprived of part of the lime and magnesia by these latter substances combining with the silica into substances insoluble in water, it will be seen that this question can never be accurately answered, even were the amount of marl spread on a certain area accurately known. The repetition of the marling is always dependent on the quantity used at any former occasion—on its chemical constituents—on the component parts of the soil—on the sort of crop reared—on the nature of the subsoil—and on the annual amount of rain. If, for instance, any sort of marl owes its manuring properties to the gypsum and phosphate of lime which it contains, its application will have to be often repeated, as it rarely contains much of these substances, and the gypsum becomes easily extracted by the water. The same is the case if it improves vegetation by the magnesia which it contains, as of this also most marls contain but very little. If, on the other hand, the value of marl depends on its carbonate of lime (which will be the case whenever the soil possesses the other nutritive substances to a sufficient amount,) it will require to be repeated only after a lapse of twenty or thirty years, it being understood that the first supply has been to a considerable amount. Because, though a small quantity of lime be dissolved and carried off by the rain-water, which contains carbonic acid, or though another portion of it combines with the silica of the soil, still enough will remain for the use of the plant, supposing that only 10,000 lbs. of a calcareous marl have been conveyed on one acre of land. Whoever wishes to ascertain before hand, with some degree of accuracy, how long a certain quantity of marl will act, has to subject to chemical analysis the marl itself, as well as the soil to be manured by it; and having accurately ascertained the component parts of both, he may form an estimate, by deducting the amount consumed by every crop, and that which is annually carried off by the rain. Though, however, all the nutritive substances of marl have been consumed by plants, it will act beneficially on dry soils for centuries, if it contains much clay; both because this will supply the plants with moisture, and because the drier the soil the smaller the quantity of soluble matter that can be absorbed by the crops.

ON THE APPLICATION OF CHEMISTRY TO AGRICULTURE UPON RATIONAL PRINCIPLES.—No. X.

(Continued from page 155.)

As I divided the chemical composition of plants into organic and inorganic, the same division must be adopted in treating of their food; but it will be more convenient to discuss the subject under the general head of

Manure, or the Food of Plants.—If any person has any difficulty in comprehending how manure applied to the soil, serves as nourishment to the plant, let him revert to the fact which he may daily witness in that beautiful process which is undergone in the incubation of the egg.

If a chemist analyses the white and yolk of the egg, he finds them identical in chemical composition, with the source of all animal nutriment—the blood; and he thus has no difficulty in solving the problem, how they are converted or organised into the perfect bird. So, if he examines the plant upon which animals feed, he finds there also the essential elements of blood from which all organised animal structure is formed. And again, if he examines the proper food, or manure of the plant, he finds in that the elements necessary for the structure of the vegetable. All difficulty at once vanishes from the subject, except a knowledge of how the mysterious principle of life performs its agency. Of this we know nothing, and it is not probable that a finite mind will ever be able to comprehend it.

Chemists, then, have no difficulty in deciding, that plants, to be grown in perfection, must have a supply of food which is similar in composition to their own ultimate structure. But Nature is sometimes obstinate in refusing the interference of man; she is always so when, from ignorance of her laws, that interference is misapplied. Granting that plants must be fed, it must always be remembered that, like animals, they require due attention to be paid to the quantity and quality of their food. For instance, although quite true that to form Gluten and Starch in the seed of grain, the plant must have supplied to it the elements of these substances, it by no means follows, that if Gluten and Starch in their pure state were given to the plant, that it would appropriate the food so offered. We must in these inquiries study and follow out the plans of Nature herself.

In primeval forests, where the trees grow to an enormous height, live, and flourish, and die, without the interference of man, how does Nature provide their food? The question is not difficult to solve. Of organic matter they require the elements carbon, hydrogen, and oxygen, to form the fabric of the plant; and in many cases, a fourth element, nitrogen, either for the perfection of their seed, or to be stored up for ulterior purposes.

The carbon is supplied from the atmosphere. The carbonic acid in the atmosphere is about one part in a thousand; and yet Liebig has calculated that this apparently small amount would produce more solid charcoal than all the vegetable kingdom and all the brown coal on the surface of the earth. By the decomposition of water the other elements, oxygen and hydrogen, are provided. Then, of nitrogen we have a source in the atmosphere, which Liebig has proved to contain a constant quantity of ammonia. But the atmosphere only nourishes plants in part. The Oak, with its immense branches, has roots as large in the interior of the earth constantly at work in selecting and appropriating proper food to the purposes of nutrition.

This food in the earth is supplied by the decomposition of the leaves and branches, forming humus; by the decay of animal matter, forming ammonia; and from rain, charged with this substance, which is constantly falling upon the surface of the earth. Of inorganic matter the supply is derived from the disintegration of the subjacent rocks.

In the wilds of Nature, with the food of Nature, we see these works of the Creator in their boldest magnificence and beauty, and there every living thing finds the means of subsistence; but civilisation, want of luxuries, and, above all, the gradual increase of mankind, create the necessity of bringing into action the aid of science in developing the resources of Infinite Wisdom.

In the food of plants which Nature restores to the soil we observe that the process of decomposition takes place before it can be appropriated by the vegetable organism to the purposes of nutrition. Vegetable matter decomposing is converted into humus. Humus is converted, by decomposition of its constituents, into carbonic acid—it is burnt, in fact, by the action of oxygen. Carbonic acid, again, is resolved, by chemical agency, into carbon and oxygen. And thus the ultimate elements of the old plants are reconverted into what are termed the proximate elements of the new, and woody fibre, starch, gum, &c., are the result. This cycle of changes is in never-ceasing activity throughout the scale of living beings. It does not, however, apply to inorganic matter, which serves no purpose in the nutrition of the plant, properly so called. Their use in the vegetable economy is either to give strength and durability to portions of the fabric, or to be stored up in its cellular structure, with the evident and beautiful design of being appropriated by the animals which feed on it.

Decomposition, then, is the first great principle to be attended to in the preparation of organic manures.

The second is to secure to the plant the results of decomposition, by fixing the volatile salts, which would otherwise be lost.

And having prepared the manure, a third object will present itself—that of applying it, with a due regard to the chemical composition of the crop to be grown, and to the necessities of the soil in which it is to be planted.—*C. R. Bree, Stowmarket.*

(To be continued.)

Home Correspondence.

Lucerne.—An article appeared in a recent Number of the *Gardeners' Chronicle* calculated to mislead many farmers who might be induced to adopt the method recommended by Mr. John Sandford and Mr. A. Hall for the cultivation of Lucerne. All husbandmen, particularly those who would know "the true principles of tillage" and grow Lucerne in the proper way, should read Jethro Tull "On Drill Husbandry." This valuable book was written more than a century ago, but there was a reprint some few years since by the late William Cobbett. It will require no great penetration to discover, by perusing this work, that the principles of Mr. J. Sandford, and Mr. A. Hall, of the Chepstow Farmers' Club, are not "the true principles of tillage." Lucerne roots deeply, so deeply that a dry surface will not materially affect its growth. If properly cultivated the crown of a plant will spread as widely as the palm of the hand, and Grasses of any kind (its greatest enemies) will, if permitted to grow, always injure it, and ultimately destroy it.—*Nicodemus.*

Scotch Agriculture.—The following extract, taken from the account of the parish of Dunbar, published in the "Statistical Account of Scotland," may be interesting to some of your readers, as bearing on the questions regarding the food of plants. It is from the pen of the clergyman of the parish, who is an able man and zealous Agriculturist. "The soil being dry, is easily pulverised and cleared of root-weeds, therefore there is comparatively but little fallow. The rotation of crops is:—1. Turnips, upon two or more ploughings, dunged, and generally fed off; when carried off, a compost of lime and earth is generally applied. 2. Wheat, with Clover and Rye-grass seeds. 3. Grass, fed off with cattle or sheep. 4. Potato Oats. 5. Beans, drilled and dunged. 6. Wheat. Instead of Oats, Wheat is sometimes taken, and then the rotation is confined to four crops. This course, peculiar to the parish, has been called the Dunbar system; but objections have been made to it. Wheat every second year, it is said, exhausts the soil; the answer is, that the food of plants in the soil may be exhausted by any crop, while the soil itself cannot be exhausted. Where there is a command of manure, there is no system which will so richly repay the labours of the husbandman. It was adopted here for many years on one of the best farms, without any diminution of either quantity or quality. And in order to ascertain whether soil is injured by frequent crops of Wheat, the glebe of Dunbar (the clergyman's allotment of land), was properly dressed, either with sea-weed, street dung, or soot, and cropped with Wheat for five successive years. The result was, an extra crop every year, and the land left in a condition that it may produce a crop or two of any kind without additional manure. The least crop in the succession was on the third year—10½ bolls (5¼ quarters) per acre; it promised to be the greatest, but it was lodged flat as the surface soon after it came into ear. All the other crops were above 12 bolls (6 quarters) per acre. One season, exactly suited to the soil, there were 16½ bolls per acre; and the last of the five years there were 14 bolls per acre. It was ascertained that on each of three of these years there were more than 300 stones of straw per acre. The soil is a sandy loam. There is another field in the parish which has produced Oats four successive years with increasing produce and fertility. Hence it seems to follow that land, properly cultivated and manured, may produce abundantly the same kind of crop in regular succession. If the food of plants is exhausted in exact proportion to the weight of crop produced, it is worthy of investigation whether the advantage of changing the kind of crop arises, not from one kind giving off food for another kind, but solely from the different modes of cultivation which different kinds of crop admit of at different seasons." Thus far the Minister of Dunbar. I will only add, that the parish is in East Lothian, and, stretching along the sea-coast, enjoys one of the warmest and driest climates in Scotland.—*J. S.*

Dairy Management.—Our Somersetshire dairymen are complaining bitterly of the great depression in the value of their dairy produce. It would be happy for them, if their complaints would lead them to see clearly the necessity of a change of system in their dairy management, which is generally as bad as it can be. The cows are out all the winter, and the pasture land is very much exposed to land floods, as it lies very low, especially in the neighbourhoods of Wales and Glastonbury; the consequence of which is, that the Grass resembles a ploughed field, from the constant tread of the animals, and the deep impressions which their feet make in the soil is filled with water. Rarely do you see any sheds for shelter. The Grass, of course, cannot provide sufficient food for them, and Hay is brought to them and thrown down in different lots, which again injures the pasture land, as it is completely trodden down, and worked up by the treadings of the animals, and in rainy weather the nourishing juices of the Hay are soon washed out, and very great waste is the consequence of this mode of feeding. It is evident also that the manure is completely wasted. Under such a system, it cannot be reasonably expected that the produce of milk can be very great. The constant exposure to cold and wet must be injurious also. The greatest want of economy appears in the whole of this system.—*A Zummerzetshire man.*

Steeping of Seeds.—Animated by the statements in the January Number of the "Agricultural Journal," I commenced a series of trials of soaking seeds in solutions of the sulphate of soda, ammonia, magnesia, and nitrate of potash, guano liquified, &c., both singly, and in various combinations. The seeds subjected to the process were those of Wheat, Beans, Oats, and Turnips, and Linseed. In every instance the vitality of the seed has been destroyed. I have entered upon a new set of experiments with steep of much greater dilution; such as 1 oz. of the salt in one pint of water: but I feel this is mere guess work, and wri to inquire whether you have made any attempt to ascertain within what limits these saline solutions may be saf employed. I fear the quantity recommended in y Paper No. 4, viz., 5 lbs. of the salt dissolved in w

merely sufficient to cover the seed, may prove too strong. May I be permitted to suggest that these seeds after steeping might be dried in some of the powders suggested by "Victor" in the "Journal of Agriculture," page 216? I have just come from an attempt to dissolve 320 lbs. of bone-dust in 160 lbs. of sulphuric acid in the manner recommended by Mr. Lawes, in the last *Agricultural Gazette*; the heat produced and vapour was so great, that if the windows and doors of the mill where the process was tried had not been thrown open, my fellow experimenter and self would have been suffocated. I mention this as a caution to any parties who adopt the plan suggested by Mr. Lawes. I think it should only be attempted in the open air.—*A. Huxtable, Sutton Rectory.* [The drying powders alluded to are powdered clay, bone-dust, charred animal matter, &c. We have put 5 lbs. of each of the salts we named into about 1½ bucketful of water, and placed the Wheat in it, about ¾ of a bushel. It is all in the ground, and we can only hope that it will not share the fate of our correspondent's unlucky seeds. These experiments are necessarily guess-work, and experience alone can teach the right proportions of the materials to be used.]

A communication from "Rustic Robin" describes the advantages of ploughing in a mixture of lime and earth applied to Clover lea. The superiority of the Wheat crop after this manuring could be distinguished many fields off.

Cow-Wheat.—In the *Chronicle* for last year, a Correspondent from the Isle of Wight mentioned that the weed called Cow-Wheat had appeared in that island amongst the corn, and he conjectured that it might have been introduced with some seed Wheat from Norfolk. I believe that the plant in question is the *Melampyrum arvense*, which is indigenous to this county. Mr. Crow, the botanist, says it grows "between Norwich and Cossey, and Bixley, near Norwich." I have made some inquiries amongst farmers respecting this weed, and they do not seem to know it; hence we may conclude it is not very troublesome.—*J. Wighton.*

Draining Materials.—"A Surrey Farmer" is entitled to credit for bringing under notice the efficacy of Scotch Fir poles as a draining material, but his plan of using them is not to be recommended. I shall endeavour to point out a cheaper, better, and more lasting one. In the first place, sawing the poles lengthways is not only a useless expense, but they will not last half so long as when placed in the drains in a round state with the bark on; but I agree with him that the poles should be cut when the sap is up. A few years ago I effectually drained a piece of bog-land, not previously worth 2*s.* 6*d.* per acre, and on which peat had been for many years cut for fuel. The plan I adopted was this: it was a flat piece of ground, and the land adjoining sloped gradually to it; I cut a drain seven feet deep between the dry land and the bog, and two feet and a half wide at the bottom, the substratum being gravel without any admixture of earth; by this means I cut off all the springs that fed the bog, and then I placed at the bottom of the drain strong Fir poles (the weedings of plantations), laying them horizontally end to end on each side of the drain, leaving a space between them of about ten inches, which, when completed, formed a funnel; and to secure the poles in their proper position I had cross bars to keep them apart nailed into them with spike nails, thus forming a sort of ladder which lay flat in the bottom of the drain. I then placed other bars between them, within a foot of each other, crossways without nails, and afterwards the branches lengthways with their fibres on. The surface sods, which were carefully preserved, were then placed so as to cover the whole with the Grass side downwards; and lastly, the drain was filled up with the excavated soil. The poles at the bottom had better be of unequal lengths, by which means the nailed bars will keep the whole line more firmly united. Where the drain crossed the sloping land as before described, I had some clay rammed in at the back of the poles at the lowest side, to prevent any of the water from percolating out of the funnel. Thus I succeeded in draining more land effectually, and at one-fifth of the expense, than I could have done with frequent drains, even if there had been a stone quarry in the field. With regard to durability, I have no doubt that Scotch Firs thus placed are superior to, and cheaper than, any other materials. Scotch Firs must answer equally well if used in a similar manner in frequent drains; but the drains must be cut to the depth of four or five feet, and they must also be at least twenty inches wide at bottom. The following year after I drained this piece of bog, it produced thirty strikes (of 40 qrs.) per acre of Muncorn (Meslin). It was pared and burned, and an allowance of lime made to it at the rate of three tons an acre; the first crop nearly remunerating all expenses, and the land is now worth 30*s.* per acre.—*T. Jones, Newtoion.*

On Storing Turnips.—The most approved and now generally adopted method of storing Turnips in Roxburghshire, is as follows:—The Turnips, deprived of their leaves and roots, are laid in an oblong heap, sloping up on both sides to a point, like a Potato-pit, and the outside ones packed close together, and a smooth uniform surface formed. The heap is then covered with dry straw to the depth of about 18 inches, which is secured and bound down by straw ropes. Turnips stored in this way generally keep well, and are scarcely ever touched by frost. Should it be late in spring before they are used, they are generally somewhat sprouted, but much less so than if they had been pitted in earth. Of course the length of the heap will depend on the quantity of Turnips. The breadth is generally about 10 or 12 feet. Swedes are now generally stored in November or December.—*A. J.*

Moles.—Wherever I go I see the trees and bushes covered with the dead bodies of the poor Moles, killed without mercy or judgment. I have wet meadows, in which they do me vast service. One of the meadows was so wet that no Mole worked into it, but only burrowed on the surface, barely deep enough to cover his body with the roots of the grass and weeds, and this only in the very dry, hot days of August—the only time when worms could be found. I dug a few drains, and the next summer found the Moles work as deep as the bottom of the drains, and into them. Another year these drains were cut as deep as the fall would allow, and the same result followed. My friends, the Moles, opened scores of their channels into the very bottom of these open drains, and the meadow is firm and sound. In all my meadows, finding the good they thus do, I never have them disturbed; but only in April send out a man to level their hillocks, then roll them; and I never have any complaint from the mowers. Depend upon it, they are very beneficial to all lands, particularly to wet bog-soil. Where 4-feet drains are made with inch-tile, they cannot enter, but would work at that depth in all directions, and be of the greatest possible use. The best open drains for meadows, if I may call them so, are some I have met with—thus made: The drains are cut about 6 inches wide, and as deep as the fall will allow—3 or 4 feet deep. In these finely-broken stones were placed to within one inch and a half of the surface; over them nothing is to be laid, the grass from the sides will run over the stones and meet, but having no earth, they act most completely as surface-drains, and as well as deep ones. They are most permanent, never out of order, never want anything done to them again.—*P.*

Pig-Feeding.—In my remarks on Pig-feeding, my observations were directed chiefly to fattening hogs to a large size; the strong food recommended does not exactly suit quarter porkers; it is too heating, and produces pimples, which give the appearance of disease; therefore, for quarter pork, I either use fine middlings with milk or pure water, or reduce the strength of the Barley and Pea-meal by adding an equal quantity of Pollard; wash or pot liquor is unpalatable to pigs during the process of fattening on meal. I have tried various liquids—mutton broth, the liquor from a round of beef, and good kitchen wash; but have always been obliged to take it out of their troughs, and replace it with meal and milk or water. It will sometimes happen, from change of weather or other causes, that the pigs get costive and are off their food; in such a case I supply them with a little green food according to the season of the year, as a few Cabbage leaves, Lettuces, or Potato tops, or with Potatoes, and Mangold Wurtzel: if, on the other hand, they are purged, I have a sod dug from the road side and given them, or, which I sometimes think is better, I let them into a yard where there are cinders, mould, and brick and chalk rubbish. I think very little of garden stuff as a means of keeping a pig in a good growing condition; it is no help farther than satisfying occasionally the cravings of hunger; sows will do on it, or on grass, if there can be added daily a feed or two from the wash-tub. As I keep sows I may as well add my management of them. During the time of gestation their diet is restricted to articles that will not produce obesity, for sows as well as cows are apt to be attacked with what is called the milk-fever; and besides, unwieldy sows have not that command over their movements that sows with a less proportion of flesh have, and are very likely to crush many of their young ones. For the first fortnight the sow is fed in such a manner as to leave off with a good appetite, and no better or more forcing food is given than fine pollard or coarse middlings; but as soon as all fever has disappeared, and the pigs can take the milk as fast as the sow can supply it, the finest middlings or oatmeal, or sometimes boiled rice, when it can be procured at about 8*s.* or 8*s.* 6*d.* per cwt., are given three times a day; the little pigs are cut when five or six weeks old, the sows are not spayed if intended for quarter pork; the operation both throws them back and disfigures them. Many people recommend a spayed sow for the poor; I always recommend a barrow pig, as growing to a larger size than the spayed sow pig, and in being far superior meat to an old spayed sow. These remarks, with what I forwarded you before, are about all I can remember for a brief sketch. In choosing a pig, look out one with a wide open chest, well filled up from the ears to the tail, small toed, and with meat in the fore arm down to the knee, and in the ham down to the hock; tail fine and short, with a small spread of hairs at the end. Let the breed be more inclined to make flesh than fat, and fine in the grain; another peculiarity should be ascertained—the breed should be famed for broad backs and small entrails; large-bellied pigs do not pull down the scale. You have now such a lecture on pigs as I sometimes give to my inquiring friends.—*J. Steele.*

Rooks.—It is singular how long men will argue about matters which facts only can decide, and when the facts might be so easily ascertained. Thus it appears by an article in the *Agricultural Gazette* of Feb. 17, p. 107, that it is yet a question whether Rooks do more good by destroying the larvæ of insects, or harm by eating grain. Now, surely this is a point which admits of being decided. What more easy than that a few sportsmen, when the game-shooting season is over, should each shoot his half-dozen rooks daily for a week, when they have made their morning's meal, and see by examining their crops what they actually contain; whether wireworms and other larvæ of insects, and slugs, &c.; and by taking the average of several days, calculate the good Rooks do in this way in the season when they have no access to grain. Again, let it be ascertained in the same mode, in seed-sowing time, both in autumn and spring, what is the relative amount of the grain and larvæ of insects, &c., which then serve them for food, and from these data the balance may be easily struck as to the good or harm done by them, and whether it is always in their favour, as some suppose, or is thought near Dumfries occasionally against them. It is to be hoped that another year will not have passed over without these important points having been ascertained, and made known through the *Agricultural Gazette.*—*S.*

Potatoes.—A correspondent asked some time back if seaweed had been used much in this neighbourhood for manure? It was not found to be of much value; but on a light loam with flinty gravel a foot below the surface, I find that the salt mud from a tide-river is an admirable manure for Potatoes. It is ploughed in fresh from the river side, before the furrows are drawn for Potato planting, and has produced an excellent crop this season without other manure. The tubers are large, clear skinned, and of very good flavour. The hint is worth the attention of those who live near any harbour, or arm of the sea. Probably Thames mud would be equally useful on light soils.—*C. D., Lavant, near Chichester.*

Experiment on Winter Fallow and Subsoil Ploughing.—This experiment was tried upon four fields, in all about 40 acres, consisting of drilled Bean stubble, and Oat stubble. The method adopted was the following:—Immediately after harvest, the fields were ploughed across, in drills, by furrows from nine to ten inches deep, laid together, and the subsoil-plough passed once between the drills seven or eight inches deep, the horses in the subsoil plough being yoked one before the other, to avoid treading on the ground subsoiled. During the dry winter weather, the drills were reversed, and the subsoil-ploughing between the drills was repeated as far as the season would allow it to be overtaken. By this plan of working, the ground was kept much drier, and a much larger surface exposed to the action of the atmosphere than is attained by the common method of winter ploughing; and the beneficial effects were evident even during the winter, from the ridges appearing drier and white, long before ground ploughed in the common way. Besides, the constant souring by the winter rains, so detrimental to clay ground, was in a great measure avoided, and the spring work rendered comparatively light and easy. At seed time, the ridges were ploughed up and down in the usual way with a light furrow—the seed furrow, of course across the drills, which, however, were never harrowed down nor interfered with, the action of the plough carrying forward enough of earth to fill up the hollows in the drills, and no more was ploughed in a day than could be sown and harrowed. In this way the rest of the field was left in the drills, and therefore less likely to be injured by the heavy rains of last spring. Part of the ground was sown broadcast, and part drilled by a single-horse plough, with a drill barrow placed between the stilts of the plough, the single-horse plough crossing the drills as in the broadcast, without being harrowed down. By this method the ground was rendered so fine, from not being so deeply ploughed, that the Grass seeds required only to be bush-harrowed, and the spring labour was rendered very light indeed. Notwithstanding the heavy rains of last spring, the Barley sowing was made very easy by this method of winter fallowing, and the same advantages were obtained in the Turnip ground, which had been similarly treated. The crop of Barley produced on the ground prepared as above, was a third more in bulk than that after Turnip ground treated in the usual way—the one being 35 threaves, and the other 48 threaves, per acre. The drilled Barley and the broadcast were nearly the same—if anything the drilled being more productive. In the Turnip field the following mode was adopted:—The winter drills were once ploughed across, and after being harrowed and rolled, the ground was immediately drilled up for receiving the dung—the rest of the field remaining in the winter drills, and thereby not suffering from the severe rains of last spring. A specimen of the Turnip may be seen in Messrs. Drummond's Museum. It may be useful to mention, that by taking the mould board off a common plough, it can be used as a subsoil-plough.—*Polmaise, Stirling, Sept.* 1843.

Spade Husbandry.—Your late Agricultural correspondent, the Rev. W. L. Rham, does not appear to have considered the subject of Spade Husbandry in all its bearings. I therefore trouble you with a few general observations upon that subject, which occurred to me after reading his paper. Both policy and philanthropy teach us that a labourer, able and willing to work, ought to be enabled to support himself by his labour instead of being, as unfortunately too many now are, a useless burden upon the land. But, in framing laws and regulations for the protection of property, we are too apt to lose sight of the only right a man who is destitute of it can claim as his inheritance—one more potent than all others—the right to live. When it is proposed to inclose and cultivate commons and waste lands, we are told that the lord of the manor has his vested right, and that the copyholders have their vested rights, in the waste, which cannot therefore be disturbed; but, surely, some plan might be devised to make all this unproductive land beneficial to the community, without injustice to either lord or copyholder. Why may not an Act of Parliament be passed empowering the guardians, or the principal rate-payers, to inclose all waste lands in their respective parishes, granting to all who now have a right of common, and to the lord of the manor, a certain portion of the land as freehold, in compensation for whatever loss they may sustain by the inclosure, the remainder to be appropriated to the support of the general poor? The benefit derived by those who now possess common-right is so trifling, that a small quantity of freehold property would be a fair equivalent; the surplus would therefore be considerable, and if well cultivated on the Spade Husbandry system by the able-bodied poor who are now living upon the labour of others, the produce would contribute to the

maintenance of the aged and infirm, and thereby materially lower the poor-rates, which in the parish where I reside amount to the enormous proportion of nearly one-fourth of the rental. The plan I propose has probably been suggested before; but, whether or not, it seems to me worthy of consideration. This, however, is not the only way in which I conceive the spade might be advantageously employed instead of the plough. Dry, shallow soils, upon which in droughty seasons the crops are materially diminished in productiveness through want of sufficient moisture at the roots to maintain a vigorous growth of plant, would be greatly improved by digging. The average depth of mould stirred by the plough in such soils will not exceed 4 inches, at a cost of about 12*s.* per acre; while the same space might be dug 9 inches deep for from 24*s.* to 30*s.*, according to the texture of the ground; and, in such a case, I calculate that one 9-inch digging would be fully as beneficial to the land as two 4-inch ploughings. Spade Husbandry, therefore, would not add to the expense of culture. It would, of course, be preposterous to suppose that all tillage could be worked by the spade; but I maintain that there is scarcely a farm upon which manual labour might not, in some degree, be substituted for horse-labour; and, if by such substitution the number of husbandry horses throughout the kingdom could be reduced only one in twenty or thirty, a very considerable portion of land now occupied in producing food for those horses might be appropriated to the sustenance of human beings. Mr. Rham's objection to employ men in doing the work of horses ought not to stand in our way. Digging in a field is no more derogatory to the "majesty of man" than digging in a garden, nor is it harder work than many things which a farm-labourer is called upon to do in the routine of business. Unmitigated poverty, on account of its too frequent offspring—crime, tends more to the debasement of a man's nature than any kind of work, however menial, by which he is able to earn an honest subsistence.—*Hortator.*

Burnt Clay.—Clay, however well burnt, is a bad material for road-making, being too soft to stand the wear and tear to which roads are exposed; but, laying aside its inferiority, it would be cheaper to bring stone a distance of ten miles than to burn clay for ballast, with coals at 10*s.* per ton, on the spot. To burn clay to good hard ballast, it requires from two and a-half to three cwt. of coals per cubic yard of ballast, and the cost, including labour and coals at 12*s.* or 13*s.* per ton, averages about 1*s.* 4*d.* per cubic yard. Faggots will not give you the heat that coals will; but those who are accustomed to use them will be the best judges of their respective merits, and the cost of each in relation to any given effect. Spring and autumn are perhaps the two best seasons of the year for burning ballast. It is generally burnt in heaps, and in the moist condition in which it is dug from the ground; it is laid in layers round the heap, and when one is sufficiently burnt, fresh coal is spread over the surface, and another layer laid on. Your correspondent asks how large a quantity may be burnt at once, provided they have plenty of clay, (and I should think they had in "Clay-down") faggots, and workmen? I am not aware that there is any limit to the quantity they may burn at a time, or the size they may make their heaps.—*G. S. D.*

Yew Poisonous to Horses and Cattle.—I saw a horse opened that had died a few hours after eating Yew branches. The stomach was greatly inflamed, and the gullet also, where, here and there, a few leaves were sticking. Inflammation seemed to have set up speedily. The branches had been lying on the ground a few days. In the withered state the Yew is more actively poisonous. I have a pony now that has often eaten the tips of growing branches.—*Este.*

Sawdust.—The following is the method of preparing sawdust for compost here:—To a large tank connected with the drain from the cattle strawyard and dunghill the sawdust is carted, and after being saturated in the tank with the drainings of the dunghill for several months, it is thrown out into a heap, and a quantity of lime-shells are mixed up with it—a layer of sawdust and a layer of lime-shells alternately. The wet sawdust slakes the lime, which acts as a stimulus to decompose the sawdust without greatly charring it. Not only sawdust, but ditch-scourings also, and the switchings of the hedges (and there are here above 20 miles in length of hedges, under the spade and knife) are prepared in this manner. The sawdust of resinous wood should be kept by itself, as there is scarcely any possibility of decomposing it.—*J. Drummond, Blair Drummond Gardens.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A WEEKLY COUNCIL was held, at the Society's House in Hanover Square, on Wednesday last, the 13th of March; present, Thomas Raymond Barker, Esq., in the chair, Thomas Alcock, Esq., R. Westbrook Baker, Esq., David Barclay, Esq., M.P., John Barton, Esq., William Beckford, Esq., W. R. Browne, Esq., French Burke, Esq., Henry Colman, Esq., A. E. Fuller, Esq., M.P., Humphrey Gibbs, Esq., Brandreth Gibbs, Esq., W. H. Hyett, Esq., John Kinder, Esq., Theodore Rathbone, Esq., Professor Sewell, William Shaw, Esq., Professor Solly, Samuel Staffurth, Esq., and William Staffurth, Esq. His Excellency Count Reventlow, the Danish Minister in London, addressed a letter to the Council in favour of M. Tesdorpf, a gentleman of large landed property in Denmark, who had come over to England for the purpose of making himself personally acquainted with the Agricultural improvements of this country; and for whom, on account of his high character and the active usefulness of his pursuits at home, His Excellency ventured to claim for him, as a distinguished foreigner, the favourable reception of the Society. The Council immediately admitted M. Tesdorpf to their sitting, and unanimously invited him to attend their Weekly Meetings whenever it might suit his convenience to do so during his residence in England. The following Gentlemen were elected Members of the Society:—

King, Frederick, Nursling, Southampton.
Turner, Thomas, (President of the Royal College of Veterinary Surgeons), Croydon.
Dowden, Thomas, Mitcheldever, near Winchester.
Percy, E. T., (Land-Surveyor), Sherborne, Dorset.
Parmiter, Edward, Beaulieu, Southampton.
Pearse, Thomas, Launceston, Cornwall.
Fothergill, Matthew, Cefnrachder, Bedwelty, Newport, Monmouthshire.
Marjoribanks, Stewart, M.P., Bushy Grove, Watford, Herts.
Hodge, Henry, Bosistow Vale, Penzance, Cornwall.
Hawkins, Henry Montonnier, Tredunnock, Usk, Monmouthshire.
Walmsley, Thomas, Ribblesdale Place, Preston, Lanc.
Hopper, John Mason, Newham Grange, Stockton-on-Tees, Durham.

The names of ten Candidates for election, at the next Weekly Council, were then read.

AGRICULTURE OF ESSEX.—Mr. Pusey, M.P., chairman of the Journal Committee, announced to the Council the adjudication of the Society's prize of 50*l.*, for the best Report of the present state of the Agriculture of the county of Essex (stating the ordinary course of cropping adopted in the different soils of the county; the breeds of cattle, sheep, and pigs, most generally bred or fed within it; the state of its drainage; the implements used; the number of horses or other cattle employed in the different operations of husbandry; the tenure on which the farms are generally held; the wages of labour; the average amount of the poor's rate; and whether any and what alterations and improvements have been made in the system of Agriculture pursued within it since the Report made to the Board of Agriculture by Arthur Young, the Secretary to the Board, and published in the years 1807 and 1813)—to Mr. Robert Baker, of Writtle, near Chelmsford.

WEIGHTS AND MEASURES.—The Marquis of Downshire communicated to the Council the great desire felt by the Royal Agricultural Improvement Society of Ireland to promote the establishment of a uniform system of weights and measures throughout the United Kingdom, for the sale of all Agricultural produce; in order to facilitate and increase as much as possible the free intercourse in commercial and Agricultural arrangements, between its three great integral portions, England, Scotland, and Ireland, reciprocally, &c. The noble marquis inclosed in his communication the particulars of the plan proposed by Mr. Blacker, of Armagh, to effect this desirable object; but as it appeared to be the ultimate result of Mr. Blacker's recommendations to establish the proposed uniformity by means of an Act of Parliament, the Council doubted whether, by the distinct legislative neutrality enjoined upon their discussions and proceedings, by the strict exclusive condition of the Royal Charter, they were at liberty to entertain the proposition; but agreed to receive the communications with thanks, and refer them to the decision of the monthly council.

FLEMISH PLOUGH.—The old Flemish Plough procured as a present for the Society, by the late Rev. W. L. Rham, and imported by his executor David Jardine, Esq., having been released from bond in the Custom-House, was this day submitted to the inspection of the members. The high value set by Mr. Rham on the properties of this plough, for use in light lands, and the difficulty he experienced when preparing, for the Society's Journal (vol. ii. p. 58), his paper on the Agriculture of the Netherlands, in endeavouring to convey, by an engraved illustration, the peculiar curve of the sheet-iron turn-furrow, in which its excellence consisted, were the reasons which induced him to procure from the Continent an actual Flemish plough for the museum of the Society. This simple plough, says Mr. Rham, has been adopted or imitated in most countries, and for light soils without stones none can surpass it. The old Rotherham plough, which was improved by Small, was only a copy of it. In France and Switzerland it has almost superseded the old ploughs of the country wherever improvements have been introduced; and, with a few modifications, to adapt it to different soils, it has re-appeared in England as an improved plough.

ROTATION OF SOIL.—Mr. Colman, the Agricultural Commissioner of Massachusetts, and at present engaged in an agricultural tour through Europe, having presented at the previous Council the model of a new implement, transmitted from Boston in the United States to this country by Mr. Isaac Clapp, for which the Council voted their best thanks and ordered all shipping charges to be paid, has laid before the Society Mr. Clapp's own account of his invention. This implement consists essentially of two rollers confined loosely on a fixed axle, and followed closely by an attached scarifier formed of a single row of strong tines. Mr. Clapp states:—"I have used this implement on newly-ploughed sward-land to great advantage. The greatest value which I consider it as possessing consists in the dispatch with which it works, and the perfect control it gives one over the soil, producing a rotation of soil which, in my opinion, is as advantageous as a rotation of crops. The working of the soil in rotation can be best effected by the use of the pulveriser, the second year, in place of the plough, leaving the sod to decompose; and then sowing Grass-seed, or a second crop, on the surface given by the first ploughing. If seeded to Grass the second year, and after the ground has acquired a sward equal to that first turned under, it may be then re-ploughed, bringing to the surface a vegetable mould that will insure an abundant crop without the aid of manure. By cultivating the soil in this manner, we have always one vegetable mould at work, and one at rest."

TRIAL OF MANURES.—Mr. Moseley, of Glenham-house, Saxmundham, Suffolk, communicated to the Council the following result of his comparative experiments with manures:—"As the cost of manure is of essential importance to Farmers, an equality of price, or nearly so, has regulated their application, which took place on the same day, early in last March, and was followed by frequent rain. The cost of each sort, excepting that of the nitrate of soda (which was put on the land by mistake, at the rate of 28*s.* per acre), was about 16*s.* per acre, exclusive of carriage and sowing. The whole produce of Grass was weighed in my presence, on the day after it was mown and strown; therefore, the weight must be deemed to be that of Grass, not of Hay.

	Tons.	cwt.
Nitrate of Soda 131lbs., cost 28*s.* per acre, and produced	4	12
Sulphate of Ammonia 58½lbs, cost 15*s.* 6*d.*, and produced	4	10
Guano 131lbs., cost 16*s.* 7½*d.*, and produced	4	12
Carbonate of Ammonia 21½lbs., cost 18*s.* and produced	3	18
Saltpetre 42lbs., cost 16*s.* 6*d.*, and produced	3	3

SULPHURIC ACID AND BONES.—Mr. Evelyn Denison, M.P., communicated to the Council a statement he had received from Mr. Brackenbury, agent to the Earl of Scarborough, containing the result of his own trials of sulphuric acid and bones on sand land in Nottinghamshire, sown with Wheat, and on forest lands newly broken up, as well as of trials made by his Lordship's tenants, both with sulphuric acid and bones, and also bones alone. These results were in favour of the land on which the chemical preparation had not been used, and particularly so in reference to that on which bones only had been applied. Mr. Denison, wishing to make the experiment on strong clay Grass-land, less favourable commonly for the operation of bones than sand-land, thought it probable that the manipulation of the mixture of sulphuric acid and bones might make a considerable difference in the result, and he was therefore not deterred from the contemplated trial by the ill-success which had attended Mr. Brackenbury's applications. Still, however, he conceived it very desirable that more distinct particulars should be furnished, in reference, 1st, to the proportions of the sulphuric acid and bones; 2d, the quantity of water; 3d, the mode of mixing; 4th, the mode of application to Grass-land; and, 5th, the strength of the sulphuric acid itself, which is often sold in a diluted state for medicinal as well as chemical purposes.—Mr. Lloyd Walrond transmitted a copy of the fourth Report of the Gloucester Farmers' Club; Mr. Renton, a copy of the Report of the Newcastle-on-Tyne Agricultural Society; and Mr. MacNab, copies of his "North British Cultivator;" for all which and other communications thanks were ordered.—The Council then adjourned to Wednesday next, the 20th of March.

A SPECIAL COUNCIL was held on Thursday last, the 14th of March; present, the Rt. Hon. Earl Spencer, President, in the chair; Hon. G. H. Cavendish, M.P.; Sir T. Dyke Acland, Bart., M.P.; Col. Austen, H. Blanchard, Esq.; T. W. Bramston, Esq., M.P.; French Burke, Esq.; Col. Challenor, H. C. Compton, Esq., M.P.; H. Gibbs, Esq.; B. Gibbs, Esq.; W. H. Hyett, Esq.; Sir J. V. B. Johnstone, Bart., M.P.; J. Kinder, Esq.; G. Kimberley, Esq.; Sir R. Price, Bart.; Professor Sewell, J. V. Shelley, Esq.; and G. Wilbraham, Esq., M.P.

SOUTHAMPTON MEETING.—The report of Messrs. Shelley and Gibbs, the stewards and director who had proceeded, agreeably with the stipulations made with the authorities of Southampton at the last monthly council, to that town, for the purpose of selecting from the localities placed at the disposal of the Society, a suitable site for the Show-yards on the occasion of the ensuing county meeting of the Society in July. The Report having been read, the stewards and director present pointed out to the Council, on Lewis's large map of Southampton, the situation of a fifteen-acre field they had strongly and unanimously agreed to recommend for their adoption, as a piece of sound old park pasture land, near Portswood-lodge, nearly even in its surface, with a gentle slope to the south, situate midway between the town and the ground selected for the trial of implements, and only a few hundred yards from the old terminus of the line of the railway, which would be re opened for the occasion; and a tram-road being laid down from that point in the direction towards Portswood, all arrivals of stock and implements would at once be wheeled almost into the very Show-yard itself, with the least possible inconvenience to all parties concerned. The Council unanimously adopted this Report; and the President ordered a meeting of the General Southampton Committee, to be held on Thursday next, for the purpose of deciding on the plans to be recommended for the Pavilion and Show-yards, and for drawing out the proper specifications of contract for the works required.

ROYAL AGRICULTURAL IMPROVEMENT SOCIETY OF IRELAND.

AT the meeting of the Council on March 7th, it was proposed that for the future, copperplate certificates, handsomely engraved, should be substituted for the Society's medals, to the Local Farming Societies, it appearing by the Secretary's returns that the sum for medals awarded last year amounted nearly to 200*l.*; that thereby a great saving would be made of the funds of the Society, which might be more beneficially applied, and the same effect produced.—Lord Erne, the chairman of the sub-committee upon Essays upon the best and most approved Plans for Cottages for the Working and Labouring Classes in Ireland, brought up the report, also signed by the Hon. C. J. Trench, and James L. W. Naper, Esq., which reported that they had examined the only essay on the subject, which had been sent in to the secretary; that the plans accompanying it were neatly executed, and their respective advantages, with the mode of building, explained in a clear and succinct manner; that the essay itself displayed

a knowledge on the part of the author of the habits of the peasantry and small farmers in the North of Ireland. The sub committee were, however, reluctantly obliged to state that they did not think that the essay possessed sufficient merit to entitle it to the Society's medal. —The secretary was directed to communicate again with Mr Smith, of Deanston, who, it was understood, was at present in this country, and to ascertain from him whether it would be in his power to undertake the task of personally inspecting the thorough-draining, executed by the four competitors for the Society's gold medal, who were selected at the last meeting of the council, for the purpose, on the principle of being the four who had executed the greatest quantity of thorough-draining amongst the different competitors.

FARMERS' CLUBS.

Bromsgrove District.—A meeting of this club was held in the Town Hall, Bromsgrove, on the 27th ultimo, G F. Iddens, Esq., in the chair.—Mr. H. F. Fardon read a paper on Manures. He considered it impossible to obtain a clear and complete view of this subject without reference to principles. He adverted to the germination of a seed and the formation of a root and leaf,—the former intended to derive nutriment from the soil, the latter from the air. It is through the root that manures act on plants. This root consists of a fibre or fibres with a small spongiole at the extremity, which absorbs water containing the food of the plant in solution. All plants do not take the same ingredients from the soil, or the same quantities of different ingredients; but they generally absorb more or less of ammonia to supply nitrogen; carbonic acid to supply carbon; potash, soda, lime, magnesia, alumina, iron, manganese, silica, sulphuric acid, phosphoric acid, and chlorine. As the farmer takes his crop off the ground the soil becomes exhausted of particular ingredients, which must be restored by means of manure. It is of importance to the farmer to know what each crop abstracts from the soil, and by what kind and quantity of manure it may be best restored. For instance, Swede Turnips take 2651 parts of potash from the soil, while only 390 are absorbed by the same weight of Potatoes, and an acre of land will yield double the weight of Swede Turnips that it will of Potatoes. Turnips, therefore, exhaust the soil of potash more than Potatoes. Besides those manures which supply plants with food, there are others which improve the mechanical texture of the soil, and some act in both ways. *Farm-yard Manure.*—A considerable portion of this consists of straw, which thus restores to the soil the ingredients it has taken from it. The dung varies in composition according to the animal which afforded it, and to the food that animal received. The better the food the richer the manure afforded. The dung-heap should be formed under cover, that it may not be washed by the rain; but in that case it must be kept moist, and no liquid should be allowed to escape from it. To preserve this it might be well to form it on a stratum of soil. The gases given off during fermentation should also be preserved. The most important of these is ammonia, which, it is believed, may be retained by covering the surface of the heap either with gypsum or common salt, the heap being kept moist. Before we can decide how long the fermentation of the heap should be allowed to proceed, we must decide whether it is desirable to apply manure in a form to come into immediate action on the growing crop, or to give out its valuable qualities gradually to two or three successive crops. The former would appear to be the most economical plan, as in the latter case some of the valuable qualities of the manure might be wasted during the intervals between the crops. In the process of decay in the heap, nitrogen is converted into ammonia, and carbon into carbonic acid; and this process should be allowed to proceed to some extent, provided nothing is allowed to escape from the heap. Potash, soda, &c., remain in the manure after fermentation; but these and ammonia too may be washed away by water. Liquid manure may either be absorbed by the litter or collected in tanks. Where there is plenty of litter, the former is the best plan, as the application of the liquid is a troublesome operation. When collected in a tank, it should be allowed to ferment a little before application, and gypsum or salt might be useful to fix the ammonia. The animal and vegetable manures produced on a farm contain all the essential ingredients; but it may sometimes be desirable to apply particular nourishment in a concentrated form, or to apply something which should ameliorate in a greater degree the texture of the soil. These artificial manures act either directly, by furnishing food to the plant, or indirectly, by acting upon other ingredients in the soil to produce food. Guano is chiefly valuable on account of the phosphate of lime and ammonia which it contains, and sulphate of ammonia is also valuable from the latter ingredient. When applied to Grass-land early in the spring, at the rate of from 1 to 2 cwt. per acre, its effect is quick and powerful. Lime should not be mixed either with this manure or guano. Soot, night-soil, and nitrate of soda, are also valuable as furnishing nitrogen. There are other artificial manures, whose action depends on their containing one or more ingredients useful as food to plants.—A long discussion followed the reading of this paper, and resolutions were passed, "That well-fermented manure produces a speedy effect on the first crop, but long manure is most permanent in its action;" and "That salt is the most economical application for fixing ammonia in manure, which can be used in this neighbourhood; and that the Club recommends it for trial."—Mr. H. F. Fardon will read another paper, in continuation of the same subject, at the meeting in March.—*H. F. Fardon, Sec.*

Westbury and Newnham.—The first monthly meeting of this club took place on the 27th Feb. last. The subject of Mineral Manures, and the Inorganic Principles of Plants, was ably introduced by Mr. Henry Bird. Previous to entering upon the subject he stated that it was necessary to make some observations upon the soils of the neighbourhood. He stated the soils of that district to consist of several varieties, but all of them very productive if properly cultivated; and divided them into the stiff dark-coloured tenacious clay resting upon the lias limestone; the stiff red clay upon the soft red marl, extending to the red sand-stone, where the soil became lighter and more stony and dry; the rich alluvial soils found in the valleys and flat portions of that district, consisting of the detritus of a variety of rocks and decaying vegetable and animal substances, conveyed there through the agency of water; and lastly, the reddish-yellow soil resting on the magnesian limestone near the Forest of Dean. He next directed their attention to the nature and varieties of the neighbouring limestones used for building and agricultural purposes, pointing out the limes that contained iron and magnesia in large quantities, and those nearly free from the above substances. The Forest limestone, of a dirty reddish colour, contained a considerable quantity of iron and magnesia, as proved by the tests of those bodies; and he stated that it was unfit for agricultural purposes, except in small quantities, for Potatoes, and such crops. The Longhope limestone, of a bluish colour, and hard enough to scratch glass, contained iron, but no magnesia, and was composed chiefly of lime and flint, and was well suited for the stiff and red soils, which coincided with the farmers' experience who had used it. The Plumphill limestone, from the Forest, of a light drab colour, and smooth upon its surface, but very hard, contained a trace of iron, and no magnesia: it was extensively used for agricultural purposes. The lias limestone, at Awre, of a dark-blue colour, contained a little iron and no magnesia. He recommended this lime for dressing land, and a farmer present stated he had used it, and found it much superior to the Forest limestone. He then examined the red clays, pointed out their composition as being very productive; but from being wet and requiring draining, there were large tracts of that land in the district nearly unproductive from the neglect of it. The first principle upon stiff and wet lands was draining, for by that means the soil would be rendered more porous, and would admit the air freely after rain, as rain-water contained ammonia which, in passing through the soil, combined with it; and that was the chief cause why well-drained land so soon became productive. He then appealed to their experience, if cultivating land so wet as not to bear good pasture ever remunerated them for their trouble and expense. Next to draining, he stated the red soils required lime to render their iron inert and their consistency more porous, by disturbing the equilibrium of the soil, and to set the potash, which they contained, free; not for the purpose of bringing humus and vegetable fibre into a soluble state, for most of the red soils were deficient in that respect, so that after liming, farm manure was necessary to make up that deficiency. He concluded by stating that many of the farmers used green manure upon their stiff lands, which he considered a good practice, as the ammonia of the dung combined with the soil, and its straw contributed to make it lighter.—Charles Rosser, Esq., inquired the best means of restoring land that had been injured by magnesian limestone; to which Mr. B. suggested the manuring of it with diluted oil of vitriol (?) as gypsum would be formed, and the fixed air of the lime would unite with the magnesia and render it soluble and useful in the soil.—Another member inquired the best means of managing manure.—Mr. B. recommended it to be turned over with mould, common salt, and diluted oil of vitriol, and to be well covered with earth, as the nitrates of potash, soda, and lime, would form rapidly in it through the agency of the air; all of which substances were useful for the different crops.

On Tuesday, the 2d of April next, Mr. J. P. Smith will give a lecture at Newnham, on Artificial and other Manures, and their application to plants.—*S. R. S.*

Reviews.

Practical Hints to Practical Men, on New and Old Manures, &c. By J. D. Humphreys, Esq. Longman.

The first half of this tract is in keeping with its title. We extract the following passage, which is usefully true:—

"How can the Farmer understand Manures unless he is a chemist? I answer—perfectly well, in the main, for the point with him is not what they are, but what they will do: it might as well be said, that he could not understand the benefit of a mutton chop, because he knows not the physiology of digestion.

"But again, it may be asserted, that the Farmer only understands the old forms of Manure, and that he has no more judgment of the new, than a sailor, landing on a foreign shore, has of its fruits,—to eat, may be to swallow poison! Very well,—but it is only so to a limited extent; for if the sailor has his wits on board, he will not eat, unless the fruit has some of the qualities of others which he has known, and which show it to be wholesome; and so the judicious Farmer will not use a new form of Manure, unless it contains the substantial qualities of the old, with new and peculiar advantages.

"It seems to have been expected, that the Farmer should become a practical student of organic and inorganic chemistry—an absurdity as gross, as to suppose, that every man should learn anatomy, because he may happen to break a limb, and need a surgeon."

But in the latter half the author forgets all this, and strings together a series of paragraphs in which he developes his peculiar views of the action of Manures, attributing it all to electric influence; in studying which, as the disciple of Sir H. Davy, he states, that he has "been so happy as to discover the governing principles of vegetable nutrition!"

This tract is apparently published as an advertisement of the "New Farmer's Compound," invented by the author. We advise its readers to pay especial attention to Mr. Humphreys's remarks on Farmyard Manure. "It is fit for all and everything:" and to depend more upon making and using a large quantity of this than on the purchase of the large quantities of artificial Manures—many of them no better than quack medicines—which now inundate the market.

Report of the Judges appointed to inspect the Farms entered for the Prize and Sweepstakes proposed by the Yorkshire Agricultural Society. 1843. J. Coultas. York.

We notice this pamphlet for the sole purpose of extracting largely from it. It is republished from the Transactions of the Yorkshire Agricultural Society, and, containing condensed reports of good farming, it includes within its 16 pages more really useful matter than is often found in Agricultural works of many times its size. There were seven competitors for the Society's premiums within the prescribed district. The judges appointed to report upon the farms were Messrs. C. Howard, W. Pick, and R. Brough; and the following are some of the remarks they make before entering upon the work of description:—

"It may be proper to state, that after an extremely wet season, from the 4th May to 11th June,—during which important period for preparing the land for the reception of green crops, little or nothing could be done,—the weather changed to an almost equally remarkable drought. The cultivation of Turnips (and especially the Swedes) was in consequence extremely difficult, and the period of sowing was necessarily much delayed. This circumstance exemplified in a striking manner the advantage of always cleaning the land to the greatest extent the season will allow immediately after the harvest.

"Left to our own judgment as to the interpretation of 'the best cultivated farm,' we could only decide upon awarding the prize to the person who, in our opinion, adopted such a system, and carried out its practice in such a manner as, in the course of years, would tend to produce the largest amount of grain and animal food at the smallest expense per bushel and per pound. We think that *good* cultivation and *profitable* cultivation are synonymous terms, and that this applies alike to the Grass and to the arable lands."

They then proceed to describe the farms they visited—

"Mr. T. C. Johnson [to whom the first prize was awarded], has occupied the Chivet Grange farm [of 283 acres], 8 years. It is land of excellent quality, situate near Wakefield, and well adapted for the four-course system of cropping, which is pursued upon it.

"*Turnip Fallow.*—The cleaning of this commences as it ought to do, immediately after the harvest. In January or February it is covered, broadcast, with manure that has been previously led from the farm-yard (and to a considerable extent decomposed), at the rate of six tons to the acre. This is immediately ploughed in, and afterwards intimately mixed with the soil. The Turnip-seed is drilled in rows 18 inches apart, with 12 bushels of bones mixed with two quarters of ashes, or pulverised earth enriched with liquid manure. Sowing upon the level was evidently advantageous in the present dry season, and the advantage of early working, after the last harvest, was strongly exemplified by the clean and forward state of the land, notwithstanding the wet weather of May and June. Some of the Swedes are drawn, for the sheep to eat upon the Grass-pastures, but the greater part of the Turnips are consumed upon the land where they have been grown, more especially upon the lighter soil.

"*Barley* is drilled after the Turnips at the rate of 13 pecks to the acre; about two-thirds of the breadth are sown with 18 lbs. of White Clover, 3 lbs. of Rib-grass, and half a peck of Italian Rye-grass per acre, for sheep pasture. The remaining third is sown with 14 lbs. of Red Clover, and half a peck of annual Rye-grass per acre for mowing. This course prevents the too frequent repetition of Red Clover, as it thus comes into use only once in 12 years.

"*Wheat* is the principal crop after the Clover or pastured Grass, though parts of the latter are occasionally sown with Oats or Beans to vary the grain. Be the Corn-crop what it may, it is sown with the drill, and hoed both for the immediate purpose of encouraging the growth of the plant, and as a preparation for the succeeding Turnip-fallow.

"*Grass Land.*—In addition to the average annual pasture of about 40 acres of White Clover and Grass-seeds, this farm possesses about 100 acres of permanent Grass-land, of very good, though not prime quality. A portion of this is dressed every year with manure, sometimes supplied from the farmyard alone, but more generally enriched with a mixture of bones. Bones are used extensively on the Grass-land. They are purchased from the manufacturers of size, after having been boiled to extract the gelatine, and are obtained at one-third less price than those which have not undergone that process. Mr. Johnson is of opinion that their fertilising qualities are uninjured by the extraction of the gelatine, but in this opinion we cannot concur. Three quarters of these bones, mixed with three cart-loads of earth, are considered the proper dressing for one acre, and the period of application not material.

"Sixty or seventy acres have been underdrained with tiles, at an average expense of 4*l.* per acre. The work has been done by Sir W. Pilkington, for which, by agree-

ment, Mr. Johnson pays an interest of six per cent. upon the expenditure.

"*Linseed Cake* is used largely with great advantage as a substitute for Turnips in the farmyard; it is given to all the cattle. By this means the manure from the folds is doubled in value; and perhaps much of the superiority in bulk and luxuriance of all the growing crops may arise from this excellent practice. They were full and regular in every part. It has been observed that Mr. Johnson spreads his manure for Turnips over the land in January and February. This is a peculiarity in management. He keeps his fold-yard manure nearly 12 months before using it; as from the large size of his yards he is not obliged to take any manure out of them until the autumn; and to prevent too rapid a decomposition when carted into the field, it is closely pressed down in very large heaps, and protected from the air by a covering of earth. We might be inclined to doubt the advantage of keeping so large a stock of manure for such a length of time; but we cannot forget the unusual weight and fertility of the crops now upon the land." *(To be continued.)*

Miscellaneous.

Guano and Turnips.—As few subjects at the present day are more interesting to our agricultural readers than the comparative merits of manures on the various soils, we notice the following statement made by Mr. Vivian, M.P., as Chairman of the Swansea Farmers' Club. At the recent meeting of that club Mr. Vivian said "he would at present only allude to a trial which he had recently made of three manures with Swedish Turnips in a field near the Bryn. He had divided the field into three nearly equal portions, and had manured one part with farm yard manure, another with bone-dust, and the third with guano. The crops from the two first were good, that from the dung having rather more leaf than the other, but the guano crop which was in the centre of the field had failed entirely, from what cause he knew not. His farm-man stated that he had mixed sixty bushels of ashes with three hundred weight of guano, and that the manure was drilled in and covered with an inch and a half of soil under the seed. However the seed did not vegetate. At the same time he should mention that some Norfolk Turnips thrown in broadcast over the ground had done very well, showing that the guano was favourable to vegetation, but that it was ticklish stuff for the farmer to meddle with in Turnip crops. On grass land he had found it answer well. But where this and other artificial manures could be applied with the greatest advantage appeared to him to be on farms that were not easy of access, and where the land had been completely run out, such, for instance, as on the Clyne farm that he had lately taken. Grain crop after grain crop had been grown there, and the crop in most instances had been carried off the land. His difficulty was to make a start and provide keep for stock, so as to get yard manure. This he was endeavouring to do by growing Turnips and other green crops by means of artificial manures, and in such cases they might be valuable. But after all, the farmer's chief dependence for manure must be on his own farm-yard."—*Welsh Paper.* [There is danger attending the *immediate* application of guano as a manure. It should be thoroughly mixed with the soil before the seed is put in above it.]

Caution to Farmers.—The following extract will show the danger and folly of the practice of keeping milk in zinc bowls, a custom which has lately become very prevalent, these articles being sold with the recommendation of a larger quantity of cream being produced, owing to galvanic action. "I would scarcely have believed," says Dr. Elaines, of Berlin, "that zinc vessels could again have come into use for holding fluids used for alimentary purposes, as Vauquelin forty years ago proved that such were certain, after a short time, to hold a considerable portion of zinc in solution. I have found by experience that a solution of sugar, which had stood only a few hours in the summer in a zinc vessel, contained a considerable amount of zinc salts. It has been often stated that the cream will separate more easily from milk if the latter be kept for a short time in a zinc vessel. As, however, it is known that milk will turn acid much sooner than a solution of sugar, it is the more to be apprehended that some zinc will be dissolved, and such milk will be the more noxious, as it is well known that even a small amount of zinc will cause violent spasmodic vomiting."—*Pharmaceutical Journal.*

Notices to Correspondents.

RURAL CHEMISTRY, By Edward Solly, Esq., F.R.S., Experimental Chemist to the Horticultural Society of London, Hon. Mem. of the Royal Agricultural Society, and Lecturer on Chemistry at the Royal Institution, has been reprinted from the *Gardeners' Chronicle*, with additions, and may be had of all booksellers, price 4*s.* 6*d.*

AGRICULTURAL IMPLEMENTS.—*An Emigrant.*—We cannot advertise tradesmen here. The best small churn we have seen is manufactured at Lewes, Sussex.

BEARING REIN.—*W. K.*—It is rarely useful.

BLUE LIAS CLAY.—*X. Y.*—Your soil is not suitable for Gorse. The scouring properties of the Grass in the months of August and September cannot, we think, be owing to the presence of sulphur. We do not know to what to attribute it.

BURNT CLAY.—*V.* and *A Zummerzetshire Man.*—See Home Correspondence.

CARROTS.—*An attentive Reader.*—If you have not sufficient yard manure apply 3 cwt. of guano per acre, broadcast, and harrow and scarify it well in before drilling the seed.

CLOVER DODDER.—*The Earl of Essex* will find that the seeds of the Clover Dodder are much smaller than those of Clover, and may be separated by the sieve. The size, No. 17, will answer the purpose. See p. 862, vol. iii, *Gardeners' Chronicle.*

DRAINING PLOUGH.—*C. W. S.*—The mole plough is generally worked by chain and capstan by two horses. If you pull it through the land by horses alone, you will need 10 or 12 if your soil be stiff. This mode of drainage answers well on Grass land.

FARM CAPITAL.—*A Farmer and Valuer.*—All the green food, &c. produced on the farm is consumed, in Mr. Morton's estimate, by sheep. You may consume as much as you like by other stock, and your doing so will reduce the stock of sheep, you will be able to keep, at the rate of about 10 sheep for every three-year-old ox or cow. Mr. Morton's estimate of the number of horses required for the farm is quite large enough. What kind of horses cannot he get for 30*l.* a-piece?

GRASS SEEDS.—*Presto.*—For a heavy soil, to remain down two years:—Perennial Rye-grass, 20 lbs.; Timothy, 1 lb.; Rough Cock's-foot, 3 lbs.; Meadow Foxtail, 2 lbs.; Meadow Fescue, 1 lb.; Red Clover, 4 lbs.; White Clover, 4 lbs.; Trefoil, 3 lbs.

GUANO.—*An Old Subscriber.*—Apply 3 cwt. per acre of it in the drills before setting the Potatoes, and work it well up with the mould by horse-hoeing, or otherwise. Sulphate of ammonia is sold by manufacturing chemists.——*Inquirer.*—3 cwt. per acre, mixed with as many cart-loads of earth, and spread some showery day. This is better than nitrate of soda, which is applied at the rate of about 2 cwt. per acre.

GYPSUM.—*Lancashire.*—Put four to six bushels per acre on your Clover.

ITALIAN RYE-GRASS.—*Suburban.*—Sow about 1½ bushel of Italian Rye grass seed, and 12 lbs. of a mixture of ½ Red Clover, ¼ White Clover, and ¼ Trefoil, broadcast, per acre, on your Barley after it is up—say about the end of April; and if the Barley has been drilled hoe them in; if the Barley has been sown broadcast, harrow them in. See what liming your land, at the rate of about 80 bushels per acre, will do to restore the Clover in your meadow.——*J. Spratt.*—Sow it after the Barley is up, and hoe or harrow it in.

MANURE.—*J. N. V.*—You had better mix your blubber compost with the manure destined for Turnips, as you propose.——*J. McT.*—The sea sand on the north coast of Cornwall is a mass of pounded shells; 60 to 100 bushels are generally applied per acre. Your oyster shells will act equally well.——*Senex.*—Guano is more likely to be a useful manure than nitrate of soda. It contains a greater number of valuable ingredients.

MURRAIN.—*J. L.*—This disease appears to be a peculiar and remarkably virulent epidemic. In many respects, it is like the epidemic called *pleuro pneumonia*, but the ulcers along the neck and back are peculiar, and resemble putrid fever. You do not say if the disease has extended amongst the cattle of your neighbours; you say the lungs are black, but do not mention whether or not they are much heavier than common, or whether any portion sinks in water. The latter appearance denotes disease of some standing; the blackness of the lungs does not. Is there any effusion of water in the chest? The course of treatment indicated appears to be bleeding in the earliest stage, but with caution, and seldom repeated. If costiveness exists, a moderate dose of Epsom salts, followed by tartarised antimony, 10 grains: submuriate of mercury, 5 grains; powdered opium, 10 grains; nitrate of potash, 1 scruple; hydriodate of potash, 4 grains. The above may be mixed up with an egg, and a quarter of a pint of Linseed oil added. For a cow, four times the strength of the above will be necessary. The medicine may be given twice a day till the bowels are in a relaxed state, and then continued without the oil, but with gruel instead. Setons may be placed in the brisket, and blisters on the chest, and shelter, care, and nursing afforded. The ulcers should be dressed with a solution of chloride of lime. *W. C. S.*——*C. H. T.*——The *post-mortem* appearances of the bodies in the fatal cases should have been mentioned. I have heard of no cases of this kind in which the feet are affected, becoming fatal in a few hours. I presume there must have been in those cases either organic disease, or the malady must have existed some little time before it was discovered. I should recommend, in many respects, the same treatment as that advised in the reply to the previous question, signed "J. L." The disease is probably principally in the chest, and if so, blisters on the sides and brisket will be necessary. The skin may be previously scalded, and one-half of the blister should consist of the ointment of iodide of mercury, and one-half of the ointment of cantharides. It should be well and freely rubbed in. To the feet, a strong solution of sulphate of copper may be applied; and if fungus should appear, it should be touched, by means of a feather, with muriate of antimony. *W. C. S.*

POND MUD.—*S. S.*—Make a compost of it with lime, and put 20 cart loads per acre on your Grass. It ought to have been done in autumn. FIFF, in the plan you allude to, are the yards of the adjacent farmery.

SMALL FARM.—*T. Ridge.*—Trench your land, keeping the top soil uppermost. Your crops, after your plan, will be 8 tons of Potatoes, 18 of Carrots, and 25 of Mangel Wurtzel. Four cows would about consume the Potatoes and Mangel Wurtzel in six months, but your horses will not in that time have eaten more than three tons of the Carrots, if they have Corn too, so that you can keep more stock, and make more manure, and if you preserve the liquid manure too, you have no occasion to buy guano.

SPADE HUSBANDRY.—*Clericus.*—Dr. Yellowly is the best writer on this subject. We do not know the titles of his works. Order "Advice, &c." of any bookseller.

THE ROT.—*Govyn.*—"It is not likely to be true" that liming sheep pastures will cause the rot.

*** As usual, many communications have been received too late.

Markets.

SMITHFIELD, MONDAY, March 11.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	4s 0	to 4s 2	Best Downs & Half-breds	4s 2	to 4s 6
Best Short Horns	3 8	4 0	Best Long-wools	4 0	4 4
Second quality Beasts	3 2	3 6	Ewes and second quality	—	—
Calves	4 0	5 0	Pigs	3 8	4 4

Beasts, 2564; Sheep, 22,370; Calves, 74; Pigs, 412.

Again we have a very wet day and an increased supply of Beasts; the prices, however, do not suffer any diminution from Friday's quotation, there being a very good attendance of buyers. In some instances the best Scots have realised 4s 4d, but not generally; Herefords, Devons, &c., 4s 2d; and the Short-horns were of superior quality that sustained our highest quotation for that description. The supply of Sheep was still very short, which caused a brisk trade at a little advance. The very choicest Downs in some instances made 4s 8d, but this price was not general; the most selling Half-breds made 4s 4d, as did also the nicest selling Longwools. Calves are moderate in supply, but no advance in price can be observed; there is a brisk trade in this article, as also in Pigs.

FRIDAY, March 15.

Although the number of Beasts is much shorter than last Friday, we have to report a very dull trade, at rather lower prices. There being a great increase in the supply of Short horns, that description has suffered more, the very best scarcely making 3s 10d per 8 lbs, and the best Scots, &c., very little over 4s. The supply of Sheep is larger, but prices remain about the same, the very top for Downs, &c., being 4s 6d, and Longwools hardly reach 4s 4d. We notice several Lambs at market to-day, but the trade for them is hardly established yet, and the weather is against the sale of them; there is, however, a demand for the best qualities at about 6s per 8 lbs. The best Calves support Monday's quotation, but middling ones are a very heavy sale at less money, the prices of Veal range from 4s to 5s. Pork remains steady.

Beasts, 699; Sheep and Lambs, 3260; Calves, 136; Pigs, 320.

41, West Smithfield.

POTATOES.—SOUTHWARK WATERSIDE, March 11.

THE late snow-storm in Scotland prevented the loading of Potatoes for several days; the "break" was felt in our market, which occasioned a shorter supply than usual, and more money was consequently obtained; this tended in some measure to check the demand, yet, the weather being favourable for the consumption of Potatoes, and the supply unusually limited, the annexed quotations have been fully realised.

York Reds	70s	to 80s	Kent and Essex Whites	60s	65s
Perth	70	75	— — Kidneys	70	75
Early Devons	70	75	Wisbeach Kidneys	70	75
Late Devons	75	—	— Blues	60	65
Cornwall	70	75	— Whites	60	65
Jersey and Guernsey Blues	70	—	Prince Regents and Shaws	70	75

WOOL.—BRITISH, FRIDAY, March 15.

OUR Market continues in pretty nearly the same state as it was reported last week. The present is considered a wholesome check, as prices were evidently getting too high. Those who hold stocks now are willing to quit them, but not at a reduction on our last quotations.

	per lb.			per lb.	
Long-wooled Wethers	1s 1d	to 1s 2d	Southdown Hoggitts	1s 1	to 1s 2d
Do. Hoggitts	1 1	1 3½	Kent Fleeces	1 2	1 3
Southdown Fleeces	1 0½	1 2			

JAMES PARHAM, Wool Broker.

COVENT GARDEN, MAR. 15.—On account of the weather having been rather changeable during the week, the market has not been so well supplied, and trade has not been so brisk. Pine-apples are a little reduced in price; they are good in quality, and sufficient for the demand. We noticed a small quantity of good hothouse Grapes in the market; Portugals are good and plentiful. Desert Apples of good quality are scarce, as are also large Kitchen ones. Pears are likewise becoming scarce. Oranges are good and plentiful; they are slightly reduced in price. Lemons are nearly the same as last week. Chesnuts are a little cheaper. Strawberries continue to be brought in small quantities. Of Vegetables, Broccoli has been more plentiful; it is a little reduced in price. Savoys are getting scarce, and Brussels Sprouts are not so plentiful. Greens are selling at from 3*s.* to 6*s.* per dozen. Early Horn Carrots are excellent and sufficient for the demand; Turnips are likewise abundant. Seakale is offered at the same prices as last week; French Beans are tolerably well supplied; Asparagus is considerably advanced in price since our last report; it is selling at from 3*s.* to 16*s.* per 100. Rhubarb of excellent quality is abundant. Celery is getting scarce, and it is very inferior in quality. Cucumbers are nearly the same as last week. Cut Flowers chiefly consist of Combretum purpureum, Lachenalia tricolor, Gardenia radicans and florida, Epacrises, Heaths, Camellias, Scarlet Pelargoniums, Acacias, Azaleas, Lily of the Valley, Primulas, Fuchsias, and Roses.

FRUITS.

Pine Apple, per lb.,	5*s* to 10*s*	Almonds, per peck,	6*s* to 7*s*
Grapes, Portugal, per lb.	1*s* to 2*s* 6*d*	Sweet Almonds, per lb.,	2*s* 6*d* to 3*s*
Apples, des., p. bush.	6*s* to 20*s*	Nuts, Spanish, per bushel,	18*s*
,, Kitchen, p bus.	4*s* to 8*s*	— Brazil,	16*s*
Pears, per half-sieve,	4*s* to 12*s*	— Hazel,	2*s* to 4*s*
Oranges, per dozen,	9*d* to 2*s*	— Barcelona,	20*s* to 22*s*
— per 100,	5*s* to 14*s*	— Cob,	12*s*
Lemons, per doz.	1*s* to 2*s*	Chesnuts, per peck,	3*s* to 8*s*
— per 100,	6*s* to 14*s*		

VEGETABLES.

Rhubarb, per bundle,	6*d* to 2*s* 6*d*	Spinach, per sieve,	1*s* 6*d* to 2*s* 6*d*
Broccoli, per bundle,	1*s* to 3*s* 6*d*	Leeks, per doz. bun.,	9*d* to 1*s*
White Broccoli per doz. from	4*s* to 9*s*	Garlic, per lb.	6*d* to 8*d*
Brussels' Sprouts, p h.-sv.,	1*s* 6*d* to 2*s* 6*d*	Onions,	2*d* to 4*d* p. bsh.,
Red Cabbages per doz.	2*s* to 3*s*	— Large, per bushel,	1*s* 6*d* to 3*s*
Sorrel,	1*s* to 1*s* 6*d* p. hf.-sv.	— Spanish, per doz.,	1*s* to 3*s*
Asparagus, per 100,	3*s* to 16*s*	— pickling, p hf.-sv.,	2*s* to 4*s*
Seakale, per punnet,	1*s* to 3*s*	Shallots, per lb.,	4*d* to 8*d*
French Beans,	2*s* to 3*s* per 100	Lettuce, Cabb., p. score,	6*d* to 1*s*
Autumn Potatoes,	3*d* to 6*d* per lb.	Celery, per bun.,	6*d* to 3*s*
Savoys, per doz.	6*d* to 1*s* 6*d*	Mushrooms, per pottle,	1*s* 6*d* to 2*s*
Greens, per doz.	3*s* to 6*s*	Walnuts, per bushel, shelled,	16*s* to 20*s*
Potatoes, per ton,	60*s* to 85*s*	Small Salads, per punnet,	2*d* to 3*d*
— per cwt.,	3*s* 6*d* to 4*s* 6*d*	Watercress, per doz. sm. bun.	3*d* to 6*d*
— per bushel,	1*s* 6*d* to 2*s* 6*d*	Parsley, per doz. bunches,	3*s* to 4*s*
— Kidney, p. bush.,	2*s* to 2*s* 6*d*	Tarragon, Green, per bun.	4*d* to 6*d*

MARK LANE, FRIDAY, MARCH 15.—The arrivals of Grain and Flour during the week have been small, owing in some measure to the boisterous weather. Having a very thin attendance at Market this morning, business in all kinds of Corn was extremely limited; nor do we observe any alteration in their value.

MARK FOTHERGILL.

BURBIDGE AND HEALY beg respectfully to inform the Horticultural world that they are quite ready to supply their new BOILER, of every size. They have now fixed a sufficient number to warrant them in stating that what they put forth as the qualities of their Boiler and Furnace arrangement may be perfectly relied upon: they have put up one at the Horticultural Gardens, where B. and H. believe it is considered to answer as represented; they have also fixed it in connection with a new description of Iron Tank, which combines the qualities of the round pipe and the open tank, which may be pronounced the perfection of a Heating Apparatus for Horticultural purposes, particularly for Graperies, Epiphyte-houses, Melon-pits, &c., &c. The arrangement is such that any gentleman or gardener may have the whole constructed so as to be put together with the greatest facility by the gardener, first sending a correct plan to 130, Fleet-street. **A Prospectus may be had containing the prices, &c.**

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, **which are now ready for immediate delivery**; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

WIRE-WORK, HOT-WATER APPARATUS, GREENHOUSES, &c.

ST. THOMAS BAKER, MANOR-HOUSE, MANOR-PLACE, KING'S-ROAD, CHELSEA, Manufacturer of INVISIBLE WIRE FENCE, to resist Grazing Stock, and rendered Rabbit-proof. WIRE-WORK in Trainers, Arches for Walks, Bordering, Flower stands, Pheasantries, &c. HORTICULTURAL BUILDINGS, Green and Hothouses, Conservatories, &c. The same heated by HOT-WATER APPARATUS, on improved and economical principles.

Parties waited on in Town or Country, and Drawings and Estimates free. Work for the Trade as usual.

Ward's Cases, or Domestic Greenhouses.

GUANO ON SALE BY THE IMPORTERS,
JOHN BOYD & Co.,
Wellington Chambers, London-bridge, Borough.

GUANO (GENUINE PERUVIAN & BOLIVIAN)
ON SALE, BY THE ONLY LEGAL IMPORTERS,
ANTONY GIBBS AND SONS, LONDON;
WM. J. MYERS AND CO., LIVERPOOL;
And by their Agents,
COTESWORTH, POWELL, AND PRYOR, LONDON;
GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.
47, Lime-street, March 15, 1844.

GUANO, PERUVIAN, &c.—The above Manures, also Potter's Guano, Nitrates of Soda and Potash, Gypsum, Bone-dust, and all other Chemical Manures of known value may be had of the undersigned, on the best terms, for cash.

Lists of Prices, with Synopsis of mode of use, on applications to MARK FOTHERGILL, 40, Upper Thames-street, and 5, Railway Place, Mark-lane, London.

MANURES FOR WHEAT, &c.

POTTER'S GUANO.—Result of an Experiment on Wheat, tried near Colchester—sown Nov. 1842, reaped August 1843. POTTER'S GUANO.—Seven bushels per acre gave 54¾ bush. Grain. Daniell's Manure, 40 bush. per acre, gave 46 bush. Grain. Difference in favour of POTTER'S GUANO, 8¾ bush.

Note.—The Daniell's Manure cost 3*l.* POTTER'S (present price) 2*l.*—Works 28, Upper Fore-street, Lambeth; sold by M. FOTHERGILL, 40, Upper Thames-street.

BEAUTIFUL FLOWERS.—POTTER'S CONCENTRATED LIQUID GUANO, for Flowers, Kitchen Garden Produce, &c. Sold by appointment, by SAVORY and MOORE, Chemists to the Queen, 136, New Bond-street, and 220, Regent-street, and can be had of most respectable Chemists and Seedsmen. Price 1*s.* 9*d.* the quart bottle, with directions.

DR. LINDLEY, in the *Gardeners' Chronicle* for 1843, p. 560, says—"POTTER'S GUANO will convert your desert into a paradise." And in the Number, Feb. 10, 1844—"POTTER'S GUANO is unrivalled."—Works, 28, Upper Fore-street, Lambeth.

TO GARDENERS AND AGRICULTURISTS.

SUPER-PHOSPHATE of LIME is capable of producing a more rapid vegetation in Plants than any substance known. It may be had at Mr. LAWES' Factory, Deptford Creek, price 7*s.* per cwt. Phosphate of Potash, 15*s.* per cwt.
" Soda . 12*s.* "
" Magnesia 9*s.* "
" Ammonia 1*s.* per lb.

THE URATE of the LONDON MANURE COMPANY, 5*l.* per Ton. It is with the greatest satisfaction, after three years' experience, the Company are enabled to recommend the above as one of the best manures for Barley, Oats, Spring Wheat, and more especially Turnips. By promoting a rapid growth of the latter it secures a full plant, at the same time producing a great weight per acre, and extending its beneficial effects to the succeeding crops. The Urate may be sown broadcast, or which is preferable, by the drill, at the rate of one ton to three acres, and it is desirable it should not be placed more than two inches below the surface. As a top-dressing for Wheat the Urate has been used with great advantage. Gardeners and Florists will find it very useful for Dahlias and other roots. Full particulars and Testimonials will be forwarded on application. Genuine Peruvian Guano; Phosphate and Sulphate of Ammonia; Gypsum and every other artificial Manure.

EDWARD PURSER, Secretary, 40, New Bridge Street.

IMPORTANT TO AGRICULTURISTS AND OTHERS.

ANALYSES OF SOILS, MANURES, &c., are conducted by MR. MITCHELL, Analytical Chemist (late of the Royal Polytechnic Institution), No. 5, Victoria Cottages, Hawley Road, Kentish Town.

A vacancy now occurs for one house or outdoor Pupil, for the study of Chemistry as applied to Agriculture. Apply as above.

TO AGRICULTURISTS.

THE Dry Material for making CAMPBELL'S CORN-PRODUCING LIQUIDS, or FERTILISING STEEPS, which have arrested the attention of Agriculturists in all parts of the United Kingdom, is now to be had in Boxes containing quantities for 5 Gallons and upwards, at the following prices:—For WHEAT, Material per Gallon ....2*s.* 0*d.*
" OATS and GRASSES, ...1 6
" BARLEY, ...2 0
" BEANS and PEASE, ...2 0
" TURNIPS and RAPE SEED 2 6

Agents in London:—Mr. EDWARD PURSER, 40, New Bridge-st.; Messrs. GEO. GIBBS and Co., 26, Down-st., Piccadilly; and Messrs. THOMAS GIBBS and Co., Corner of Half-moon-street, Piccadilly.

TO AGRICULTURISTS.

ENGLAND INDEPENDENT OF THE WORLD FOR CORN.

THE attention of the Agricultural Interest, at this momentous crisis, is requested to the great importance of LIQUID MANURE, and the ease with which it may be appropriated, by the use of FOWLER'S PUMPS, made expressly for the purpose, either portable or fixed: Garden, Ship, and Barge Pumps; also, those for Distillers, Brewers, Soap-boilers, and Tanners, for hot and cold liquor. Pumps kept for Hire, for Excavations and Wells, Buildings heated by hot-water, for Horticulture, and every variety of manufacturing purposes. The trade supplied on advantageous terms, by BENJAMIN FOWLER, Engineer, &c., 63, Dorset-street, Fleet-street, London.

GLASS SUPERSEDED for HORTICULTURAL PURPOSES by WHITNEY'S CHEMICAL TRANSPARENT WATERPROOF COMPOSITION, rendering Muslin, Calico, or Linen, for the Frames of Greenhouses, Pine, Melon, or Cucumber Stoves, &c., impervious to rain or moisture, admitting light equal to Glass, much warmer, and the plants never burn under it.

Noblemen, Gentlemen, and Gardeners will, by using this composition, have the only effectual protection for their Fruit-trees during the blooming season; it is a certain defence from frost, sleet, wind, and blight; its transparency admits the general beams of the sun, with abundance of light, which causes the bloom to expand with increased luxuriance, the fruit to set and swell more freely, much earlier, and a crop of fruit to any extent may be warranted. The covering not to be moved by day (except to thin the Fruit, which will be necessary), till the month of June. It is recommended that the Calico be prepared early, **so as to be thoroughly dry before using.**

Sold in Bottles, with directions for use, pints, 2*s.* 6*d.*, quarts, 4*s.* 6*d.* each. One pint is sufficient to coat four Frames twice over, each Frame to be 5ft. by 3ft. 3in., or thereabouts. **Prepared by GEORGE WHITNEY, Chemist, Shrewsbury. Seedsmen,** Florists, and Merchants supplied by Mr. W. BAILEY, Chemist, North-street, Wolverhampton. Appointed Agents:—Messrs. BUTLER and MUCKLEY, Covent Garden, where a sample of prepared calico may be seen; Mr. WATKINSON, Market-place, Manchester; PAGE and SON, Southampton; T. and C. WHALLEY, Nurserymen, Liverpool.

Agents wanted for London and the country.

YORKSHIRE LAND-DRAINING ASSOCIATION.

Mr. William Tuke, Bradford.

With power to add to their number.

BANKERS.—The York City and County Banking Company.
STANDING COUNSEL.—H. Bellenden Ker, Esq., Lincoln's-inn.
DRAINING ENGINEER.—James Smith, Esq. (Deanston.)
SOLICITORS.—Messrs. Blanchard, Richardson, and Gutch, York.
SECRETARY.—John H. Charnock, Esq., Wakefield.

This Association is formed for the purpose of affording to the Agricultural Interest, by means of its collective capital, the funds necessary for the THOROUGH DRAINING OF LAND; and of **executing and superintending the execution of the works required for this purpose on the most economical and effective principles—repayment of the money advanced to be made, with interest,** by such equitable **half-yearly instalments as in the several cases** may be determined.

Among the **various objects to which of late years** collective capital has been more or less successfully applied, it is not a little surprising that the one which, of all others, offers the most certain and profitable return, with the soundest security, should have hitherto been almost disregarded. The time, however, has arrived, when an urgent desire for Agricultural improvement on the one hand, and a dearth of safe and profitable investment for superabundant capital on the other, renders such an Association highly desirable to both the landed and monied interest, whilst **to the community generally an almost incalculable advantage will be secured by a proportionate increase of labour and food.**

At a meeting of the council of the Yorkshire Agricultural Society, held in York, on the 20th of December, 1843, a resolution was passed, approving generally of the objects of this Association, and at the monthly meeting of the Wakefield Farmers' Club held on the 5th January, 1844, a resolution approving of the **principle** and objects of the Association, was unanimously adopted.

At the meeting of the Royal Agricultural Society of England, at Liverpool, in July, 1841, Lord Stanley remarked—that "there was no bank in the whole country—no commercial speculation—no investment so safe, so sure and profitable, as that in which even borowed capital may be engaged, by investing it under the ground of your own soil." And in reference to this Association, his Lordship, in a letter to the Committee says:—"I am fully satisfied of the benefits which such an Association is capable of conferring on the country, if confined to its legitimate object—the lending of capital on the security of an investment in draining; and I think it very probable that many landed proprietors would avail themselves of the facilities afforded by an institution lending money on land, repayable by instalments—a condition on which few private parties are willing to lend.

Bearing in mind the important objects of the Association, and the perfect security with which its operations can be conducted, at a comparatively trifling expense (no large expenditure for previous outfit being required), **it may be reasonably expected that** the return for the capital embarked will be such as to insure the support of prudent and permanent investors, thereby divesting it of that speculative character which has stigmatised so many modern projects, and which it is the especial desire of the Committee to avoid.

Application for prospectuses, and further particulars to be addressed to the Solicitors, Messrs. BLANCHARD, RICHARDSON, and GUTCH, York; or to J. H. CHARNOCK, Esq., the Secretary, Wakefield.

ASPHALTUM in its pure state, with all the material and instruction how to prepare, or if required, the labour performed at a moderate charge.—Apply to J. A. HUBBARD and SON, 20, Harp-lane, Tower-street. All Letters prepaid.

CHOICE FLOWERS and PLANTS in POTS.

HUMPHREYS'S COMPOUND, applicable to all Greenhouse Plants, to Melons, Cucumbers, &c., and to promote the germination of Seeds. Sold in bottles 1*s.* 9*d.* each, by FLANAGAN and SON, Mansion-house street; HURST and MCMULLEN, Leadenhall-street; W. CLARK, Bishopsgate-within, SMITH, Islington Nursery; GRIMLEY and Co., Covent Garden; BATT and RUTLEY, 412, Strand; WILLIAM and JOHN NOBLE, Fleet-street; SMITH, Covent Garden; CHARLWOOD, Tavistock-row; **W. J. NUTTING, 46, Cheapside; G. LAWRENCE, 18, Piccadilly;** JOHN KERNAN, Great Russell-street, Covent Garden; LOCKHART, 156, Cheapside; SHUTTLEWORTH, Pantheon; MINIER, ADAMS, and NASH, 63, Strand; THATCHER and SON, Islington; J. FRYER, Clarendon-terrace, Camberwell; THOMAS ANSELL, Camden Town; THOMAS WATKINSON, Market-place, Manchester; T. S. KING, Rochester: W. E. RENDLE, Plymouth; DICKSON and Co., Edinburgh; PONTEY, Leeds; FISHER, HOLMES, and Co., Sheffield; P. LAWSON and SON, Edinburgh; J. THORNE, Shepton Mallet; and other leading SEEDSMEN in town and country. Wholesale Agents, DAVY, MACKMURDO, and Co., 100, Upper-Thames street, London.

AGRICULTURAL IMPROVEMENT.

SPRING WHEAT.—HUMPHREYS'S FARMERS' COMPOUND, manufactured on a *new principle*, so as to present a cheap manure of greater power, and more extensive usefulness, than the guano; and without its caustic rankness, and liability to be washed out of the soil. From its wholesome character, it is unrivalled for garden culture; and as a Top-Dressing for all Spring Crops. Per acre, for WHEAT, BARLEY, &c., with a bad soil, *Five cwt.*; with better land, *Three* or *Two*. GRASS on the average, *Two cwt.* TURNIPS, THREE or TWO. Price 12*s.* per cwt. Agents, DAVY, MACKMURDO, & Co., Manufacturing Chemists, 100, Upper Thames-street, London.

CHOICE FLOWERS AND PLANTS IN POTS.

HUMPHREYS'S INODOROUS SOLUBLE COMPOUND. A few grains dissolved in water, and used occasionally, are effective. For list of Agents see other Advertisement.

TO COLONISTS, AGRICULTURISTS, &c.—Mrs. MARY WEDLAKE, widow of the late Mr. THOMAS WEDLAKE, of the Original Iron-foundry and Agricultural Implement Manufactory, established forty years, at Hornchurch, near Romford, Essex, and of 118, Fenchurch street, London, begs to inform the friends of her late Husband that she continues to Manufacture all kinds of Agricultural Implements, for the invention of which he was so often honoured with the medals of the Royal Society of Agriculture, and which obtained for him so high a distinction among the Farmers of England and British Colonists. Being assisted by men of talent in the Manufacture of these articles, she is in hopes of deserving the high repute this Establishment has so long enjoyed, and now solicits respectfully a continuance of the patronage of the numerous friends of her late husband. The following articles, made in a very superior manner, are kept on sale at the London Warehouse, 118, Fenchurch-street, viz.:—

Patent Hay-making Machines	Subsoil Ploughs
Winnowing Machines	Horse-power and Hand-thrashing Machines
Dressing Machines	Patent Horse Rakes
Patent Chaff-cutting Machines	Scarifiers
Oil-cake Crushers	Drills of all kinds
Double-action Turnip Cutters	Park Fencings, Hurdles
Flour Mills	Furnace Bars
Bean Mills	Cast Iron Horse Racks
Railway Wheels, Vacuum Pumps	Kitchen Ranges
Patent Essex Ploughs, 30 different sorts	Stoves, Fenders
	*** Castings to any pattern.

☞ *For a more detailed List, see Johnson and Shaw's "Farmers' Almanack" for* 1844.

Please to be particular in the address, Mrs. MARY WEDLAKE, 118, Fenchurch-street, London: or, Original Iron Foundry, Hornchurch, Essex.

AGRICULTURAL PROTECTION SOCIETY.—

PRESIDENT—The Duke of Richmond.
VICE-PRESIDENT—The Duke of Buckingham and Chandos.

TRUSTEES.

1. **That a Society, to be called the Agricultural Protection Society for the United Kingdom of Great Britain and Ireland, be now formed, for the purpose of upholding,** by constitutional means, protection to British Agriculture.

2. That the object of this Society is to maintain protection to British Agriculture, not less than that at present existing.

3. That the Society shall, through the press, repel the imputations and point out the inconsistencies contained in the statements of those who oppose such protection.

4. That party politics shall not be introduced into the proceedings of this Society, and that the Society shall on no account interfere in any election for a Member to serve in Parliament.

5. That the affairs of the Society shall be managed by a President, Vice-President, four Trustees, and a Committee of 40 Members, whereof 20 shall always be tenant-farmers; and that Chairmen or Vice-Chairmen of Country Societies connected with this Society shall be ex officio members of this Committee, and that the said Committee shall have power to add to their numbers.

6. That any funds contributed by such Country Societies or individuals be paid into the Bank of England, to the credit of the Trustees of the Agricultural Protection Society for the United Kingdom of Great Britain and Ireland.

7. That the publications of the Society be issued on reduced terms to Country Societies which have contributed to its funds.

8. That a donation of not less than 5*l*, or an annual subscription of not less than 5*s.*, shall constitute every person who shall agree in the principles of this Society one of its members.

9. That there be an Annual Meeting of the Society in the month of December, notice of which shall be given in the London papers three weeks previously.

10. That the meeting of the General Committee shall take place, except as hereinafter stated, on the first Tuesday of every month, to receive and take into consideration the reports of the different Sub-committees.

The next meeting of the General Committee will take place on Friday, the 22d inst., at Eleven o'clock, at 51, Portland-place.

(Signed) RICHMOND, President.
W. MILES, Hon. Secretary.

HORTICULTURAL SOCIETY OF LONDON.—

LIST OF PRIZES

OFFERED AT THE EXHIBITIONS IN THE GARDENS, IN 1844.

MEDALS AND REWARDS.

The Society distributes the following Medals and Rewards; viz.:

	value—£	s.	d.
C. The Certificate	0	10	0
SB. Silver Banksian Medal	1	0	0
SK. Silver Knightian Do.	1	5	0
LS. Large Silver Do.	1	15	0
SG. Large Silver Gilt Do.	4	0	0
GB. Gold Banksian Do.	7	0	0
GK. Gold Knightian Do.	10	0	0
LG. Large Gold Do.	20	0	0

Exhibitors to whom any of these shall be awarded can exchange them one for another, or may receive their value in money, or in plate. In case an Exhibitor shall receive a First Prize in any one Letter, he shall not be entitled to receive any other Medal in the same Letter, except in *CC*, *DD*, and *EE*.

CLASS I.—FLOWERS; for which Nurserymen and Private Growers exhibit independently of each other.

A. Pelargoniums, in collections of 12 new and first-rate varieties, cultivated with superior skill, in pots of 24 to a cast. GB—SG—LS—SK.

B. Pelargoniums, in collections of 12 varieties, in pots of 12 to a cast. SG—LS—SK.

N.B. Persons exhibiting in *B* cannot also exhibit in *C*.

C. Pelargoniums, in collections of 6 varieties, in pots of 8 to a cast. LS—SB.

D. Rhododendrons, in pots; not fewer than 6 plants, in 6 varieties. LS—SK—SB.

E. Roses, in pots; Amateurs to show in collections of 12, Nurserymen in collections of 25, distinct varieties. GB—SG—LS.

N.B. It is the wish of the Society in a future season, to require Roses to be shown exclusively in pots; and not to allow cut specimens to be exhibited at all.

F. Moss Roses in loose bunches, so as to exhibit, as far as possible, the habit of the variety; in 12 varieties. SK—SB—C.

G. Other Roses, exhibited as in the last letter, and in 50 varieties. L S—SK—B—C.

N.B. No one who exhibits in this letter can also compete for the following.

H. Other Roses, exhibited as in the letter *F*, and in 25 varieties. SK—SB—C.

N.B. Higher medals than those here offered for Roses cannot be given by the Judges. And if Roses are brought for exhibition without attention to the regulations here explained, they will not be allowed to be placed on the tables.

I. Cape Heaths, in collections of 20 distinct varieties. GB—SG—LS.

N.B. It is expected that the same plant shall not be exhibited on more than one occasion.

K. Cape Heaths, in collections of 6 distinct varieties. SG—LS—SK.

N.B. No person who shows in *I* will be allowed to exhibit also in *K*.

L. Calceolarias, in sixes; in pots of 12 to the cast. LS—SK—SB.

M. Carnations, in pans of 24 distinct varieties. LS—SK—SB.

N. Picotees, in pans of 24 distinct varieties. LS—SK—SB.

O. Pinks, in pans of 24 distinct varieties. SK—SB.

CLASS II.—FLOWERS; for which all persons are admitted to equal competition.

P. Stove or Greenhouse Plants, in collections of 30 plants. GK—GB—SG—LS.

N.B. Heaths, Calceolarias, Fuchsias, Greenhouse Azaleas, Rhododendrons, Orchidaceæ, Cacti, and Pelargoniums, to be excluded from *P*, *Q*, and *R*.

Q. Stove or Greenhouse plants, in collections of 15 plants. GB—SG—LS.

N.B. Persons exhibiting in *P* not to compete in *Q* also.

R. Stove or Greenhouse plants, in collections of 6 distinct species. SG—LS—SK.

N.B. Persons exhibiting in *P* or *Q* will not be allowed to compete in *R* also.

S. Greenhouse Azaleas, in 12 distinct varieties. GB—SG—LS.

T. Greenhouse Azaleas, in 6 distinct varieties. SG—LS.

N.B. No one can show in both classes of Azaleas.

U. Stove or Greenhouse climbers, in collections of 6 species. SG—SK.

V. Exotic Orchidaceæ, in collections of not fewer than 20 species. LG—GK—GB.

N.B. Exhibitors cannot show in more than one of the classes, *V*, *W*, and *X*.

W. Exotic Orchidaceæ, in collections of not fewer than 6 species. GK—GB—SG.

X. Exotic Orchidaceæ in single specimens. SG—LS—SK.

Y. Plants in glass cases, grown on Mr. Ward's plan. SG—LS—SK.

N.B. It is highly desirable that these cases be made with a movable door, so as to prevent the condensation of the water on the inner face of the glass during the time of exhibition.

Z. Distinct varieties of Tall Cacti in flower. GB—SG—LS.

N.B. The GB and SG Medals are not to be given if fewer than six varieties are exhibited.

AA. Fuchsias in collections of 12 distinct varieties. LS—SK.

BB. Cinerarias, in pots, in collections of 12 distinct varieties. SK—SB.

CC. Single specimens of new or extremely rare ornamental plants. SG—LS—SK—SB—C.

N.B. These Medals will be awarded by the Society's Officers, and not by the usual Judges. Exhibitors will particularly observe that none but new or rare plants can be exhibited under this letter. *Nothing will be regarded as new which has been exhibited in the Gardens in a previous season.*

DD. Miscellaneous subjects. SK—SB—C.

N.B. Cockscombs, Heartsease, Hydrangeas, and cut flowers, are altogether excluded from exhibition. Exhibitors under this head will not be thereby *entitled* to a pass ticket.

EE. Seedling Florists' flowers. SK—SB—C.

N.B. Every seedling must be shown singly, and must be marked with the name it is to bear. The same seedling cannot gain a prize more than once in the season. Pelargoniums are to be shown in pots, and not in a cut state. No person will be allowed to exhibit more than five seedlings at each meeting. Exhibitors under this head will not be thereby *entitled* to a pass ticket.

IN ADDITION to any medals assigned to the classes *I*, *P*, *Q*, and *W*, the SK and SB medals are offered for the two collections in those classes which shall be best named by the Exhibitor.

N B. The Society's officers, who will make this award, will be guided in their judgment by a consideration not only of the correctness of the names, but of the accuracy of the spelling, and the neatness of the writing.

CLASS III.—FRUIT, for which Market Gardeners, Fruiterers, or persons in the habit of regularly supplying the market, and private growers, exhibit independently of each other.

N.B. All Fruit must be FULLY ripe and WELL-COLOURED; if the contrary it will be disqualified.

FF. Miscellaneous collections of Fruit, consisting of at least three different kinds, Peaches and Nectarines being considered as only one kind. GK—GB—LS.

N.B. Cucumbers, Tomatoes, Gourds, and similar Kitchen Garden produce, are excluded from this letter.

GG. Grapes. SG—LS—SK—SB.

HH. Pine-apples. SG—LS—SK—SB.

II. Peaches or Nectarines, in dishes of six specimens. SK—SB.

KK. Other kinds of Fruit. SK—SB—C.

JUDGES.—The Judges have the power of *increasing* or *diminishing* the number and value of the silver medals offered by the Society for particular objects, and also of *conferring* Silver Medals or Certificates in cases not contemplated in these regulations, if they think it necessary to do so.

The Judges are also required to bear in mind that the Society's Medals are offered less for new and curious objects, than for fine specimens of Horticultural skill, the design of the Council in instituting these meetings being not so much to encourage the collector as to reward the skilful Gardener; they are also not to make any award in cases where the objects exhibited do not appear worthy of a Medal; otherwise a bad single exhibition might obtain a prize, merely because there is no better exhibition of the same class to oppose it.

Copies of the above list may be obtained at 21, Regent-street, upon application to the Secretary.

FASTOLFF RASPBERRY.

PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN, HIS GRACE THE DUKE OF RUTLAND, THE MOST NOBLE THE MARQUIS OF AILSA, THE EARL OF HARRINGTON, THE EARL OF LIVERPOOL, THE LORD BISHOP OF LONDON, LORD VISCOUNT LORTON, LORD SONDES, &c. &c; as well as by the HORTICULTURAL SOCIETY OF LONDON.

YOUELL AND Co. have much pleasure in announcing they are now supplying Fine Canes of the above highly-valuable and much-esteemed RASPBERRY, unequalled for the extraordinary size of its fruit and richness of flavour.

Those to whom Y. and Co. sent it last season have expressed their high admiration of its superiority over all other varieties, and has been awarded several prizes from various Horticultural exhibitions during the season. As a proof they have not exaggerated its excellent qualities, fruit was submitted to Dr. LINDLEY, (see *Gardeners' Chronicle* of the 22d July last, page 502), whose opinion of it is as follows:—

"FASTOLFF RASPBERRY.—We have received from Messrs. YOUELL, of Great Yarmouth, fruit of the Fastolff Raspberry, and we find its merits all that has been stated in favour of its excellence. The fruit that we have received is very large, obtusely conical, and of rich flavour, far exceeding in this respect some other new and large varieties. The plants bear abundantly, and in long succession."

They also exhibited it on the 1st of August, 1843, before the London Horticultural Society, 21, Regent-street, to which a prize was awarded. It would therefore be unnecessary for YOUELL and Co. to recommend it more fully, or with greater confidence to the notice of the public, merely observing, that it continues in high perfection throughout the autumnal months, and has maintained its superiority in the most unfavourable soils and situations, and requires no other than the ordinary treatment of the old varieties.

Fine Canes are ready for delivery, and can be sent with safety to any part of the United Kingdom (on the receipt of a Post-office order), upon the following terms:—

			£	s	d
Packages containing 100 Canes			2	5	0
Do.	do.	50 do.	1	5	0
Do.	do.	25 do.	0	14	0

Package included.

The usual discount to the Trade where not less than 200 are ordered.

*** CAUTION.—Y. and Co. beg to call the attention of their Friends and the Public in general to the fact that they have appointed no Agents in London for the sale of the above, and cannot be held responsible for its being genuine, unless purchased direct from their Nursery.

THE NEWEST AND VERY BEST FUCHSIAS, VERBENAS, PETUNIAS, ANAGALLIS, &c., FOR 1844.

YOUELL AND Co. beg to refer the Readers of the *Gardeners' Chronicle* to their Catalogue of the above, which appeared in this Paper of 2d inst., and will be found to contain such varieties only as are worthy of cultivation.

YOUELL & Co. being the parties who first sent out per post, with safety, these tribes of plants, are desirous of calling attention to their advantageous method of executing orders, namely, that they will deliver them free of postage (on the receipt of a Post-office order), to any part of the United Kingdom, upon the following terms:—

12 Extra Fine varieties, 12*s*, the Selection left to Youell & Co.
12 ditto ditto 21*s*., the Selection left to the Purchaser.
50 Fine varieties . . 40*s*., the Selection left to Youell & Co.
50 Extra Fine ditto . 60*s*., the Selection left to the Purchaser.

VERBENAS.

12 Extra fine Varieties, 6*s*., the selection left to Youell & Co.
12 Ditto ,, 10*s*., the selection left to the purchaser.

With the exception of those marked thus.*

The plants will be strong and healthy, and ready for delivery by the latter end of March, with the exception of those marked thus * (which will be ready in April), thus ensuring the Purchaser fine plants for competition in the ensuing season. Many of the varieties can be supplied now.

CHRYSANTHEMUMS.

50 Newest and Best Varieties, 12*s*. per dozen.

PANSIES.

12 Fine Show Varieties, by name, 9*s*. per dozen.
12 Extra fine do. do. 10*s*. ,,

Per post free.

FLOWER-SEEDS.—30 packets of the newest and best kinds, sent per post free for 6*s*.

TWO NEW SEEDLING PICOTEES.—"LADY ALICE PEEL," 10*s*. 6*d*., and "MRS. BENYON," 10*s*. 6*d*. per pair.—These two splendid Picotees were raised by the Rev. J. Burroughes, of Lingwood Lodge, Norfolk, and kindly presented by that gentleman to Messrs. YOUELL & Co., for particulars of which see their Advertisement in this Paper of the 16th of Sept.

FINEST CARNATIONS AND PICOTEES.

YOUELL AND Co. beg to refer the Readers of the *Gardeners' Chronicle* to their Extensive List, with Prices, of the above highly esteemed Flowers, which appeared on the Advertising pages, 706 and 707, of this Paper, of October the 14th, and will be found to contain every variety worthy of cultivation.

Prices as follows:

	£	s.	d.
12 pair of good Show Sorts	1	4	0
12 ditto fine ditto	1	10	0
25 ditto ditto	3	0	0
12 ditto extra fine and very superior ditto	2	10	0
25 ditto ditto	5	0	0

The selection being left to YOUELL & Co.

ARAUCARIA IMBRICATA, recently planted most extensively at Her Majesty's Gardens at Windsor, and also at the Royal Gardens, Claremont, furnished by YOUELL and Co.

YOUELL AND Co., possessing the most extensive stock in the country of the above Splendid Hardy Ornamental Tree, beg to offer them on the following advantageous terms:—Fine robust 4-year-old plants, 8 to 10 inches high, 10*l*. per 100, or 30*s*. per dozen.

Fine Plants of CEDRUS DEODARA, 2ft. to 2ft. 8ins., 10*s*. 6*d*. each.

Great Yarmouth Nursery, March 14, 1844.

SATURDAY, MARCH 16, 1844.

BOTANICAL & GARDENING WORKS

PRINTED FOR

LONGMAN, BROWN, GREEN, & LONGMANS.

THE THEORY OF HORTICULTURE; or, an Attempt to explain the Principal Operations of Gardening upon Physiological Principles. By JOHN LINDLEY, Ph.D., F.R.S. 8vo. Illustrations on Wood. 12*s.* cloth.

INTRODUCTION TO BOTANY. By Professor J. LINDLEY, Ph.D., F.R.S. Third Edition, with Corrections and considerable Additions. 8vo. Six Plates and numerous Woodcuts, 18*s.*

A NATURAL SYSTEM OF BOTANY; or, a Systematic View of the Organization, Natural Affinities, and Geographical Distribution of the whole Vegetable Kingdom; together with the uses of the most important species in Medicine, the Arts, and Rural or Domestic Economy. By JOHN LINDLEY, Ph.D., F.R.S. Second Edition, with numerous Additions and Corrections, and a complete List of Genera, with their Synonyms. 8vo. 18*s.*

SCHOOL BOTANY; or an Explanation of the Characters and Differences of the principal Natural Classes and Orders of Plants belonging to the Flora of Europe, in the Botanical Classification of DE CANDOLLE. For the use of Students preparing for their matriculation examination in the University of London, and applicable to Botanical Study in general. By JOHN LINDLEY Ph.D., F.R.S., Fcp. 8vo., with upwards of 160 Woodcuts, 6*s.*

A SYNOPSIS OF THE BRITISH FLORA, arranged according to the Natural Orders. By Professor JOHN LINDLEY, Ph.D., F.R.S., &c. The Third Edition, with numerous Additions, Corrections, and Improvements, 12mo. 10*s.* 6*d.*

GUIDE TO ORCHARD AND KITCHEN GARDEN; Or, an Account of the most valuable Fruits and Vegetables cultivated in Great Britain: with Kalendars of the Work required in the Orchard and Kitchen Garden during every month in the year. By GEORGE LINDLEY, C.M.H.S. Edited by Professor LINDLEY. 8vo. 16*s.*

AN ENCYCLOPÆDIA OF GARDENING; presenting in one systematic view, the History and Present State of Gardening in all Countries, and its Theory and Practice in Great Britain. with the Management of the Kitchen Garden, the Flower Garden, Laying out Grounds, &c. By J. C. LOUDON, F.L.S., &c. New Edition, enlarged and much improved. 8vo. With nearly 1,000 Woodcuts, 2*l.* 10*s.*

AN ENCYCLOPÆDIA OF PLANTS; including all the Plants which are now found in, or have been introduced into Great Britain; giving their Natural History, accompanied by such descriptions, engraved figures, and elementary details, as may enable a beginner, who is a mere English reader, to discover the name of every Plant which he may find in flower, and acquire all information respecting it. New Edition, with a Supplement. By J. C. LOUDON; W. H. BAXTER, Jun.: GEORGE DON, F.L.S.; and J. D. C. SOWERBY, F.L.S. 1 vol. 8vo. with nearly 10,000 woodcuts, 3*l.* 13*s.* 6*d.*

HORTUS BRITANNICUS; a Catalogue of all the Plants indigenous to, or introduced into Britain. Third Edition, with a NEW SUPPLEMENT, prepared, under the direction of J. C. LOUDON, by W. H. BAXTER, and revised by GEORGE DON, F.L.S. 8vo. 31*s.* 6*d.* The First Supplement, separately, 2*s.* 6*d.*, the New Supplement, separately, 8*s.*

THE ROSE AMATEUR'S GUIDE; containing ample Descriptions of all the fine leading varieties of Roses, regularly classed in their respective families; their History, and Mode of Culture. By T. RIVERS, Jun. Third Edition, corrected and improved. Fcp. 8vo. 6*s.*

THE TREE-LIFTER; or, a new Method of Transplanting Trees. By Colonel GEORGE GREENWOOD. 8vo. with illustrative Plate. 7*s.*

A SCRIPTURE HERBAL. With upwards of 120 Wood Engravings. By LADY CALLCOTT. Square crown 8vo. 1*l.* 5*s.*

CONVERSATIONS ON BOTANY. Ninth Edition, improved, fcp. 8vo., with 22 Plates, 7*s.* 6*d.*; with the Plates coloured, 12*s.*

THE PRINCIPLES OF DESCRIPTIVE AND PHYSIOLOGICAL BOTANY. By J. S. HENSLOW, M.A., F.L.S., &c. Fcp. 8vo. with Vignette Title, and nearly 70 Woodcuts, 6*s.*

A PRACTICAL TREATISE ON THE CULTIVATION OF THE GRAPE VINE ON OPEN WALLS. By CLEMENT HOARE. Third Edition, 8vo. 7*s.* 6*d.*

AN INTRODUCTION TO THE STUDY OF BOTANY. By Sir J. E. SMITH, late President of the Linnean Society. Seventh Edition (1833), corrected; in which the object of Smith's "Grammar of Botany" is combined with that of the "Introduction." By Sir WILLIAM JACKSON HOOKER, K.H., LL.D., &c. 8vo. 36 Steel Plates, 16*s.*; with the Plates coloured, 2*l.* 12*s.* 6*d.*

THE ENGLISH FLORA. By Sir JAMES EDWARD SMITH, M.D., F.R.S., late President of the Linnean Society, &c. 6 vols. 8vo. 3*l.* 12*s.*

CONTENTS:

Vols. I. to IV. The FLOWERING PLANTS and the FERNS, 2*l.* 8*s.*

Vol. V. Part 1, 12*s.*—CRYPTOGAMIA; comprising the Mosses, Hepaticæ, Lichens, Characeæ, and Algæ. By Sir W. J. HOOKER.

Vol. V. Part 2, 12*s.*—The FUNGI—completing the work, by Sir J. W. HOOKER, and the Rev. M. J. BERKELEY, F.L.S., &c.

COMPENDIUM OF THE ENGLISH FLORA. By Sir J. E. SMITH. Second Edition, with Additions and Corrections by Sir W. J. HOOKER. 12mo. 7*s.* 6*d.*

THE SAME IN LATIN. Fifth Edition, 12mo. 7*s.* 6*d.*

THE BRITISH FLORA. In Two Vols. Vol. I., comprising Phænogamous or Flowering Plants and the Ferns. By Sir WILLIAM JACKSON HOOKER, K.H., LL.D., F.R.A., and L.S. &c. &c. &c. Fifth Edition, with Additions and Corrections; and 173 Figures illustrative of the Umbelliferous Plants, the Composite Plants, the Grasses, and the Ferns. 8vo. with 12 Plates, 14*s.*; with the Plates coloured, 24*s.*

Vol. II in Two Parts, comprising the Cryptogamia and Fungi, completing the British Flora, and forming Vol. V., Parts 1 and 2, of Smith's English Flora, 24*s.*

THE VEGETABLE CULTIVATOR; containing a plain and accurate Description of all the different Species of Culinary Vegetables, with the most approved Method of Cultivating them by Natural and Artificial Means, and the best Modes of Cooking them; with a Description of the Physical Herbs in General Use. By JOHN ROGERS, Author of "The Fruit Cultivator." Second Edition. Foolscap 8vo. 7*s.*

"'Rogers's Vegetable Cultivator' is a useful book."—*Gardeners' Chronicle.*

LONDON: LONGMAN, BROWN, GREEN, & LONGMANS

THE PENNY CYCLOPÆDIA

OF THE SOCIETY FOR THE DIFFUSION OF USEFUL KNOWLEDGE

IS NOW COMPLETED,

IN TWENTY-SEVEN VOLUMES, EXTENDING TO FOURTEEN THOUSAND PAGES,

PRICE TEN POUNDS IN CLOTH BOARDS;

In Half-morocco or Russia, gilt tops or marbled edges, Lettered Contents, 13*l.* 10*s.*; and in 14 Volumes, Half-Russia, 12*l.* 12*s.*

THE Name of the Penny Cyclopædia was derived from its original issue in a weekly sheet, when a work of much less magnitude was contemplated. From its commencement it has been supported by a great body of Contributors, eminent in their respective departments; and its articles, in many of the great branches of knowledge, are regarded as authorities, and have acquired celebrity wherever the English language is read. The character of the work has gradually, therefore, surmounted the prejudices which were excited in some quarters by its title; and the word PENNY is now received as indicative only of its extreme cheapness. Every article in the work is an original contribution, paid for at a rate to secure, as far as payment is concerned, the highest talent and knowledge, not only of this country, but of foreign states. *The literary expenditure* alone upon *each Volume* has exceeded 1200*l.*, making a *total* of 33,000*l.* In addition, the Work is fully illustrated with Woodcuts, the cost of which has amounted to more than 8000*l.*; making a total cost, for Literature and Art, of more than FORTY THOUSAND POUNDS. The PENNY CYCLOPÆDIA may, therefore, as a standard work, enter into competition, in the great essentials of fulness and accuracy, with any existing Cyclopædia, whatever may be its selling price. It is especially valuable as a work of reference, as all the Arts and Sciences are to be found according to their subdivisions in the alphabetical arrangement, and yet the subjects are so treated that the general principles and facts involved in each article may be traced in connection with other cognate articles.

*** A list of the Contributors is given in the last Volume.

LONDON: CHARLES KNIGHT & CO., 22, LUDGATE-STREET.

BEE-HIVE.—THE BAR AND FRAME-HIVE.

Early in April will be published, by Mr. JOHN VAN VOORST, of Paternoster-row, in the form of a pamphlet, for the convenience of transmission through the Post-office,

A DESCRIPTION of the BAR and FRAME BEE-HIVE, invented by W. A. MUNN, Esq., with some short Directions for the Management of an Apiary.

A Bar and Frame-Hive may be seen at Mr. JOHN MILTON'S, No. 10, Great Marylebone-street, London.

WORKS on AGRICULTURE, GARDENING, &c.,

PUBLISHED BY

WILLIAM CURRY, JUN., and Co., Dublin; Sold by LONGMAN and Co., London, and all Booksellers.

HINTS to SMALL FARMERS. By MARTIN DOYLE. New Edition, 1*s.* sewed.

By the same Author,

PRACTICAL GARDENING. 12mo, cloth, 4*s.*; or in Two Parts—1. The FLOWER-GARDEN, 2*s.* sewed; 2. The KITCHEN-GARDEN, 1*s.* 6*d.* sewed.

ADDRESS to LANDLORDS, on subjects connected with the Improvement of their Estates and the Melioration of the Lower Orders. New Edition, enlarged, 2*s.* sewed.

IRISH COTTAGERS. 1*s.* sewed.

HINTS on HEALTH, TEMPERANCE, and MORALS. 1*s* swd.

HINTS on PLANTING, CATTLE, FISHERIES, &c. 1*s.* sewed.

The Works Collected in Two Vols., cloth, 12*s.*

A TREATISE on AGRICULTURE, comprehending the Nature, &c. of Soils, the Cultivation, &c. of Plants, and the Husbandry of the Domestic Animals, &c. Second edition, enlarged, with numerous illustrations. 8vo. 15*s.*, cloth.

TREATISE on an IMPROVED and CHEAP METHOD of CULTIVATING ASPARAGUS. By NINIAN NIVEN. 1*s.* sewed.

FLORA HIBERNICA, comprising the Flowering Plants, Ferns, Characeæ, Musci, Hepaticæ, Lichens, and Algæ of Ireland, arranged according to the Natural System, with a Synopsis of the Genera according to the Linnæan System. By JAMES TOWNSEND MACKAY, M.R.I.A. 8vo. 16*s.* cloth.

Just Published, Price 5*s.*

THEORY AND PRACTICE APPLIED TO THE CULTIVATION OF THE CUCUMBER IN THE WINTER SEASON; with a Chapter on MELONS. By THOMAS MOORE, Royal Botanic Gardens, Regent's Park.

"This little Treatise is intended as an inducement to *young Gardeners especially*, to seek for the reasons on which the operations of their daily practice are founded, and by which they are regulated."—*Preface.*

London: R. GROOMBRIDGE, Paternoster-row.

SECOND EDITION.

MILLS'S TREATISE ON THE CULTURE OF THE CUCUMBER, MELON, SEA KALE AND ASPARAGUS. Published by WILLIAM SMITH, 113, Fleet-street.

The truth of Dr. LINDLEY'S statement, in his review of the above work, was strictly verified at the late Great Exhibition of Cucumbers at Ipswich, viz., "Any person having Mills's Book, whether a Gardener or not, can grow Cucumbers."

By the report of the above exhibition in the *Gardeners' Chronicle*, the first prize was won by an Amateur, Edward Leathes, Esq., on Mills's system. Four Seeds of Mills's Best Early Cucumber, 2*s.* 6*d.*; eight ditto, 5*s.* Post-office Orders to be made payable at Brentford.

DISEASED AND HEALTHY LIVES ASSURED. MEDICAL, INVALID, and GENERAL LIFE OFFICE, 25, Pall Mall, London.—This Office is provided with very accurately-constructed Tables, by which it can Assure Diseased Lives on Equitable Terms. Increased Annuities granted on *unsound* Lives, the amount varying with the particular disease. Members of Consumptive Families Assured at Equitable Rates. E. G. P. NEISON, Actuary.

AUSTRALASIAN COLONIAL and GENERAL LIFE ASSURANCE and ANNUITY COMPANY, 126, Bishopsgate-street, Corner of Cornhill.

Capital £200,000, in 2000 Shares.—DIRECTORS:—

E. Barnard, Esq., F.R.S.	Gideon Colquhoun, Esq.
Robert Brooks, Esq.	C. E. Mangles, Esq.
Henry Buckle, Esq.	Richard Onslow, Esq.
John Henry Capper, Esq.	William Walker, Esq.

BANKERS.—Union Bank of London.

COLONIAL BANKERS.—The Bank of Australasia (incorporated by Royal Charter, 1835), No. 2, Moorgate-street.

PHYSICIAN.—Patrick Fraser, Esq., M.D., No. 62, Guildford-st.

SECRETARY.—Edward Ryley, Esq.

ASSURANCES may be effected with this Company at unusually favourable rates, affording every variety of accommodation to the Assured. Participation in Profits, ascending and descending scales of premium, permission to retain one-third of the premium, which is charged as a debt against the policy, tables for the assurance of a sum payable in the event of death to the executors of the Assured, or to himself upon the attainment of the ages of 45, 50, or 60.

To EMIGRANTS to the AUSTRALASIAN COLONIES assured for the whole life, this Company offers the advantages of permission to proceed to, to reside in, and to return from those colonies without extra premium, and to pay their premiums there.

All questions relating to Assurance and Annuities, addressed to the Secretary, will receive immediate attention.

PROVIDENT LIFE OFFICE, 50 REGENT STREET, FEB. 15, 1844.

BONUSES DECLARED, 529,306*l.* 17*s.* 7*d.*

NOTICE is hereby given, that all Persons who hold Policies in this Office, bearing date prior to the year 1834, may receive the present value of the Bonuses which have been added to their Policies, upon application at the Head Office, or to the Agents through whom the Policies were issued.

GEORGE BEAUMONT, Actuary.

NATIONAL MERCANTILE LIFE ASSURANCE SOCIETY, ARTHUR-STREET WEST, LONDON BRIDGE. (Established in 1837.) *Directors.*

Chairman.—Robert Currey, Esq.

Edward Baker, Esq.	Thomas Bax, Esq.
Jasper Capper, Esq.	Joseph Cooper, Esq.
Thomas Dakeyne, Esq.	Russell Jeffrey, Esq.
Giles Redmayne, Esq.	William R. Spicer, Esq.
James Spicer, Esq.	Joseph Sterry, jun., Esq.
Henry Sterry, Esq.	Robert Wilcoxon, Esq.

Bankers.—Messrs. Prescott, Grote, and Co.

ADVANTAGES.

A BONUS of two-thirds of the Profits allotted to the Assured.

LOWER RATES OF PREMIUM charged for Assurances without profits.

PREMIUMS payable Annually, Half-yearly, or Quarterly.

ASSURANCES OF EVERY DESCRIPTION may be effected. Among others, the important one, *originated by this Society*, of securing a sum to the Assured himself on his attaining any given age, or to his family *in the event of his earlier death.*

A POCKET DIARY containing detailed particulars, may be had on application at the Office, or of the Society's agents.

JENKIN JONES, Actuary and Secretary.

ACTUARY: Peter Hardy, Esq., F.R.S.

Extract from the Report of the Directors of the Society, to a General Meeting of the Members, holden the 17th January, 1844:

"At the end of the six years which have been completed since the 31st of December, 1837, there are in existence in the Society three times as many policies as there were in existence at the end of the year 1837. The capital sums assured under these policies are nearly doubled in amount. The corresponding income derived from annual premiums is also nearly doubled. The accumulated property of the Society is four times as great as it was at the end of that year, and the present divisible surplus is nearly six times as much as that declared in the division of the year 1837."

The Directors invite the public to compare the following Table of the Additions made to the Ten oldest existing Policies in the Society, up to the 31st of December, 1843, with the additions made by other Societies within the same time:—

1834, Policy No.	Sum Assured.	Premium.	Age at Admission	Total Addition made in 1842.	Increase, 1843.	Total Addition made in 1843.	Amount of Premiums paid.	The total addition is equivalent to the following per centage on the amount of premiums paid.
	£	£ s. d.		£ s. d.	£ s. d.	£ s. d.	£ s. d.

PETER HARDY, Actuary.

News of the Week.

THE subject of duelling has been again brought prominently before the public by the debates in the House of Commons on Monday and Thursday night. The discussion of Monday arose upon Captain Bernal's motion for the correspondence which had passed respecting the withdrawal of the usual pension from the widow of Colonel Fawcett. The attention of the House, however, was by no means confined to the case of the late duel. Sir H Hardinge in justifying the withholding of the pension, entered at some length into the general question, and stated that various alterations have been made, by her Majesty's sanction, in the Articles of War relating to duelling. These alterations are to take effect during the present year, and are expected materially to discourage this practice in the army, but Sir H. Hardinge refused to be a

party to any restraint being laid on military men in private life, to which other gentlemen were not subjected. The debate on Thursday, though less lengthy, was more general in its objects. The resolution proposed by Mr. Turner, pledging the House to a declaration against duelling, was ultimately withdrawn, but it had the effect of eliciting from many leading Members of both sides of the House a decided expression of their feelings. Sir Robert Peel doubted whether any legislation would be effectual, and stated that though the Government had been influenced by this consideration in not bringing forward any law on the subject, they were nevertheless willing to allow a fair and dispassionate discussion of any measure which might be introduced.—On Tuesday Mr. Cobden brought forward his motion for a select committee to inquire into the effects of protective duties on imports on the interests of the tenant-farmers and farm-labourers of this country. A long debate ensued, for which we must refer to our report, and at its close the motion was negatived by a majority of 91. On Wednesday a discussion took place on the second reading of Lord Worsley's Inclosure Bill, and Mr. S. Crawford moved as an amendment that it be read that day six months; on a division, however, the second reading was carried by a majority of 47.

From France, we learn that the question so long at issue between the Church and the University on the subject of education, is daily assuming fresh importance, and that the approaching debate on the Secret Service Money Bill is, by the consent of all parties, to be considered a vote of confidence in the Ministry.—From Spain we have no news of any consequence respecting the disturbed districts, and from Portugal there is merely the announcement that the military insurgents are making a hopeless stand in the indefensible fortress of Almeida.—The accounts from the United States contain the details of a melancholy accident on board a new war steamer, by which two Secretaries of State and other official persons were killed. President Tyler and two hundred ladies of the first families of New York were on board, but fortunately escaped uninjured.

Home News.

COURT.—The Queen held her first levee for the season on Wednesday, which was very numerously attended. The second levee takes place on Wednesday next. Her Majesty and Prince Albert have taken their usual walk in the Palace Gardens, during the week, whenever the weather has permitted. Prince Albert presided at a meeting of the Fine Arts Commissioners on Friday, and at a meeting of the Office of the Duchy of Cornwall on Thursday. Her Majesty received a small circle at dinner on Wednesday evening, being the first dinner party at the Palace since the death of the Duke of Saxe-Coburg. The Court mourning will expire in about a fortnight; after which it is expected that Her Majesty will give a series of banquets and evening parties. The Black Eagle steam-vessel left Woolwich on Tuesday for Portsmouth, to be in readiness at the latter port to receive Prince Albert, and convey his Royal Highness to the Isle of Wight, for the purpose of personally examining Osborne House, the marine residence which it is expected Her Majesty will occupy in that island during the approaching season. His Royal Highness will leave town on Monday for this purpose. It is rumoured that the King of the French will visit Her Majesty at her marine residence in the autumn, and that the Emperor of Russia will previously pay a visit to the Queen at Windsor. It is understood that the royal apartments in Kew Palace are to be forthwith prepared for the temporary sojourn of the Prince of Wales and the Princesses, during the stay of the Court in town. A rumour has been current that Prince Albert will go, during the Easter recess, on a short excursion to the continent, to visit his relations at Coburg; but the report appears to be entirely without foundation. Viscountess Jocelyn has succeeded Lady Portman as the lady in waiting. The Marquis of Ormonde has succeeded Lord Byron as the lord in waiting; and Sir Frederick Stovin has succeeded Admiral Sir R. Otway as the groom in waiting on Her Majesty.

Death of Sir Henry Halford.—Our obituary this week records the death of this eminent physician, who expired at his residence in Curzon-street on Saturday evening after a protracted and painful illness. The deceased was second son of Dr. Vaughan, of Leicester, by Miss Smalley, maternal granddaughter of Sir R. Halford, Bart., and cousin of the last baronet of that family. He was born 1766, and married March 31, 1795, the second daughter of Lord St. John, who died in 1833. On the death of Sir Charles Halford, Bart., his cousin, he inherited the estates of that baronet, and assumed the name of Halford. Sir Henry for a lengthened time was physician to George III. and George IV., and attended the Duke of York and Duke of Gloucester during their last illnesses. Although retired from his professional duties, he still retained his appointment as Physician to the Duchess of Gloucester and Princess Sophia, and was one of the physicians in ordinary to the Queen. He was President of the Royal College of Physicians, and was distinguished for his classical and literary acquirements. His Latin Essays and Orations are models of elegant Latinity, and he was considered the most accomplished scholar in the profession. He is succeeded in his baronetcy and estates by Mr. Henry Halford, M.P., born in 1798, and married to the second daughter of his uncle, the late Sir John Vaughan, Justice of the Common Pleas. The present baronet was elected representative of South Leicestershire in 1832, and has since continued Member for that district.

Foreign.

FRANCE.—The Paris Journals are principally taken up with the renewed debate in the Chamber of Deputies, on the Fortifications question, and with the subject of the Secret Service Money. Ministers obtained a majority on the Fortifications, as the most enthusiastic of the Republican party were in favour of those works, "convinced that no French soldiers would ever concur in rendering them available for starving, much less for cannonading the capital," and the Deputies generally approved of their construction; but it was distinctly understood that the arming of the detached forts "in time of peace" would not be sanctioned by the Chamber.—The Deputies met on Thursday in their standing committees to examine the Secret Service Money Bill. The friends of the Ministry succeeded in returning eight commissioners out of nine. The commission met on Monday, when Marshal Soult, M. Guizot, and their colleagues of the Home Department were present, and replied to various questions of internal and external policy. On being asked whether the English Government had been requested to recall Mr. Pritchard their Consul at Otaheite, and in such case what answer had been received, M. Guizot said that he did not deem it proper to reply to the first part of the question; but with regard to the second, he declared that he had full confidence in the good faith of the English Cabinet and believed that Consul Pritchard would be disavowed and recalled. In reply to other questions, the three Ministers assured the Committee that they had no objection whatever to the Secret Service Money Bill being viewed, as in former years, as a vote of confidence in the Administration, but that on the contrary, they would be glad to see the Opposition submit their policy, on that occasion, to the judgment of the Chamber. The debate will probably commence on Monday next.—At one of the previous sittings, the Chamber a second time annulled the election of M. Charles Laffitte for Louviers; the first having been declared void on the ground that he had made use of some railway scheme as the means of securing his return.—The dispute between the Church and the University is assuming an exceedingly serious character. The *Moniteur* of Sunday contains a letter from the Minister of Justice to the Archbishop of Paris, condemning him in the strongest terms for having, in concert with four of his suffragans (the Bishops of Blois, Meaux, Versailles, and Orleans), drawn up and signed a memorial on the subject of public instruction, which "casts blame on the state establishments for education, as well as on the corps of teachers, and which makes insinuations against a Minister of the King." The Minister reminds the Archbishop that there is a law of association against bishops deliberating together without permission—a law which must not be eluded by "making correspondence supply the place of deliberation." And, finally, the Minister reminds the Prelate of the necessity of observing the articles of the *Concordat*. Hitherto the present Archbishop of Paris has been most moderate, and acted as an intermediate between the Minister and the more zealous clergy. His going into opposition renders the affair more serious than it has yet been. In addition to this the Abbé Combalot, a preacher of some note, was sentenced at the Paris Assizes, on Wednesday, to an imprisonment of a fortnight and a fine of 4000f., for the publication of a book against the irreligious tendency of the University system of instruction.—The leading Italian political refugees in Paris were on Friday sent for by the Prefect of Police, and cautioned against carrying on or entering into any conspiracy for revolutionising Italy. General Pepe expressed his indignation at the proceeding, which he declared perfectly unjustified by facts. It was nevertheless the universal belief in Paris that the entire Italian peninsula is ripe and ready for revolt, but that no danger of a rising on a large scale can exist during a time of peace, or so long as the colossal force of Austria in Italy remains undiminished.—The Ministry was still engaged in its war with the press. The appeal of the *National* against a sentence of the Correctional Police was rejected by the Court of Cassation on Friday. Twelve of the soldiers of the 70th Regiment, arrested for the alleged military conspiracy, were sent in chains from Paris on the same day for embarkation for Algiers.—The *Toulonnais* of the 5th inst. announces, that Rear-Admiral Hamelin had been summoned up to Paris by telegraph. It was believed in Toulon that he would be sent to replace Admiral Dupetit Thouars in the command of the South Sea station. A subscription has been got up in Paris for the purpose of presenting a sword of honour to Admiral Thouars, and a considerable sum has been received, although the maximum subscription is fixed at 10 sous each.—The Duke de Nemours has been ill, but is now convalescent.—The *Journal du Havre* says:—"Persons who have a direct intercourse with the Court of the Tuileries inform us that it is arranged that, about September next, Louis-Philippe shall proceed in person, with all his Court, to England, in order to pay a visit to Queen Victoria. The interview will not take place in London, but in the Isle of Wight. It seems to be believed at the Tuileries, that after his visit to the Isle of Wight, Louis-Philippe will persuade Queen Victoria to make an excursion to Paris."—M. Dumon, the Minister of Public Works, has laid on the table of the Chamber of Deputies, a project of law relating to the railroads to be constructed from Paris to the Belgian frontier, from Paris upon England, and from Orleans to Vierzon. The railway from Paris upon England, already decreed by previous law of June, 1842, is to be directed upon Calais, Dunkirk, and Boulogne. The lines upon Calais and Dunkirk will leave the line upon the Belgian frontier and Ostricourt between Douay and Lisle, and will be directed—that on Calais by Hazebrouck and St. Omer—that on Dunkirk by Hazebrouck and the west of Cassel. The Boulogne line will leave the Belgian line at Amiens, and be directed by Abbeville and Etables. A sum of fifteen millions of francs is to be appropriated to the establishment of the lines on Dunkirk and Calais.—In addition to the murder of Mr. Ward, the Paris papers mention several other instances of crime recently perpetrated in the capital and its vicinity. Among them is that of a young man, a student of pharmacy, aged 21, who was convicted on Saturday of robbery, and sentenced to death for murdering a poor lady of 75 years of age, at her residence, in one of the most populous streets of Paris, and in broad daylight. This announcement follows in the papers an account of the murder of a poor woman, under nearly similar circumstances, in the Faubourg St. Martin, Paris, on Thursday last; while on Sunday afternoon, a vine-dresser from Vermecey, who had passed the day at Orleans, was waylaid on his return and shot dead; and it is said that another murder has just taken place at Montargis.—The papers mention a quarrel between the crews of a French and English vessel at Marseilles—an event which would pass unnoticed in London, or Liverpool; but such is the state of public feeling in France, that the affair is gravely announced as another insult to the French flag.—The floods were subsiding in Paris; but the accounts from the south state the occurrence of disasters throughout the country from the inundations.

SPAIN.—We have accounts from Madrid of the 8th inst. Queen Isabella II. and her sister accompanied by General Narvaez, two Ministers of State, and the principal officers of her household, left Madrid for Aranjuez on the morning of the 6th to meet the Queen-mother Maria Christina, who was to sleep on the 10th at Albacete. Her first interview with her daughters was to take place between Ocana and Aranjuez.—A telegraphic despath from Perpignan states that the entry of Queen Christina into Barcelona on the 4th was a triumph; there was great enthusiasm, and the town was magnificently illuminated. Her Majesty was to leave on the 7th or 8th by land for Tarragona, there to embark for Valencia. The arrival of Queen Christina in Madrid is looked upon by all parties as the prelude of a change of Ministry. If Her Majesty should give her support to the present party it is said that the Progressistas are determined upon a movement similar to that of 1840. It is also said that the marriage of Queen Isabella to her cousin the Count Trapani is not only pushed with vigour, but is nearly certain. The Neapolitan Ambassador has had several interviews on the subject with Senor Gonzales Bravo, who had expressed his approbation of the project; and the Duke de Rivas, the Spanish Minister now on his way to Naples, is said to be a stanch partisan of a matrimonial union with Naples. The inscription and other emblems commemorative of the revolution of the 1st Sept., 1840, had been removed from the façade of the Town-house in compliment to Queen Christina.—The last despatches from General Roncali, dated Villa Franquesa, the 29th ult., state that early in the morning of that day the insurgents of Alicant, to the number of 300 infantry, with 60 horse, and 2 pieces of artillery, made a sortie in the direction of the Cruz de Piedra, for the purpose of destroying the batteries in progress of construction on that side. They were, however, charged by detachments of the regiments of Savoy and Lusitania, who occupied that point, and beaten back into the place, with the loss of six killed, and a large number wounded. The siege artillery had not then been landed, owing to the boisterous state of the sea. A later despatch, dated Bayonne, March 11, states that Alicant and its garrison have risen against the chief, Bonet, who has fled, and that the town and fort are in the hands of the Queen's troops.—The contemplated expedition against Morocco was a general subject of conversation. By some it was stated that its effective force would amount to 20,000 infantry and 2000 cavalry, and that the command in chief would be given to General Concha, and that of the advanced guard to General Prim. Others believed that the troops now assembling at Puerto de Santa Maria were merely intended to reinforce the garrison of Ceuta, which had been of late menaced by the Moors; while others believed that, in the present distracted state of Spain, no expedition against a foreign power will be attempted.

PORTUGAL.—Accounts from Lisbon of the 6th state that the military insurrection is not yet altogether suppressed. The insurgents have shut themselves up in Almeida, a place of considerable strength in former times. The principal fort and works were greatly injured by the French, and were still further rendered indefensible by our troops. The civil Governor recently, on evacuating the town, was ordered to spike the guns, consisting of four pieces of different calibre, dismounted; the instructions were not complied with, and these pieces remain in the hands of the insurgents. The number of revolted troops in Almeida are said by the friends of the Government to amount to 600; by the friends of the insurgents they are estimated at upwards of 1000. The Count de Bomfim has been indefatigable in his endeavours to place the town in a state capable of resisting his assailants. The town is now regularly besieged by the troops under the command of the Baron de Leiria and the Counts de Fonte Nova and Vinhaes. They have four field-pieces with them, the besieged have as many dismounted but easily to be made serviceable. It is stated they have no lack of provisions, but the want of money is acknowledged by their partisans. The Government, on the contrary, have

succeeded in getting pecuniary support from England to the extent of 12,000*l.*

GERMANY.—The *Swabian Mercury* mentions a report from Vienna that a Congress of Sovereigns will be held in the summer either there or at Tœplitz, and that the Emperor of Russia and the Queen of England will be present. —Accounts from Stutgardt announce that the King of Wurtemberg had been indisposed, but was better on the 9th.—It is reported at Munich, according to a letter of the 2d inst. from that city, published in the *Universal German Gazette*, that in case King Otho should happen to die without an heir, the young Duke of Wurtemberg, grandson of Louis-Philippe, will be made successor to the Greek throne.—Our countrywoman Miss Birch has been singing at Berlin, with the greatest success, under the patronage of the Earl and Countess of Westmoreland.—The General Diet of Hungary have adopted, without discussion, and by a majority of 41 votes against 8, a motion for the emancipation of the Jews.—We learn also from Vienna that the Emperor, by letters patent of the 15th inst., counter-signed by all the Ministers, and sealed with the grand seal, has granted to Baron Salomon Rothschild, the head of the firm of Rothschild, in that capital, and to his male heirs, the right of purchasing and holding real property of every description in the provinces of Moravia and Silesia. He thus acquires a right which is denied to all the Israelites throughout the Austrian monarchy. The title of honorary burgess of Vienna, conferred upon him last year by the municipality, secures to him a similar privilege in that capital.—The *Augsburg Gazette* gives the following from Posen, under date the 25th ult.—"The fate of the Russo-Polish refugees is decided. This morning about two-thirds of them were sent under escort to Magdeburg. The remainder will follow in a few days, with the exception of a few, who have received permission to stay until the end of March. Amongst the persons affected by the measure are the Count de Plater, who has always resided here in a very retired manner, and who recently purchased an estate in the Grand Duchy; the rich Count de Potocki, son-in-law of Count Edward de Razzinghi, Count Eugene Breza, and M. de Luszewski, who is the owner of two houses in Posen."—It is rumoured that accounts have been received from Goritz announcing the death of the Duc d'Angoulême, but at present we have no confirmation of the report.

SWEDEN.—Letters from Stockholm of the 23d state that the King is much better. The papers mention an interesting letter, which the King dictated himself from his bed to the Duke of Wellington, in answer to one his Grace had addressed to his Majesty. The King in this letter expresses his profound esteem for the Duke, and his gratitude for the sympathy and solicitude his Grace has constantly evinced during his severe malady.

MALTA.—Letters from Malta state that Capt. Glasscock, of the Tyne frigate, has met with a serious accident, while riding out near Beyrout, by a fall from his horse, by which he broke his shoulder and fractured his ribs. He was carried on board his frigate, and at the date of the last letters, was doing well.

RUSSIA.—It is rumoured in political circles that the Emperor of Russia may be expected in England in the month of May, on a visit to the Queen.—Letters from St. Petersburgh, of the 20th ult., speak of the excessive rigour of the winter. On the night of the 19th the cold is said to have been at 30° Reaumur below zero, which equalled the intensity of the winter of 1813, when Napoleon made his entry into Moscow. Although the people in Russia are better clothed and prepared than then to face the inclemencies of the season, yet 14 persons were frozen to death on the nights of the 19th and 20th on one of the roads leading out of St. Petersburgh, and four more in the city. The snow was full four feet deep in the streets. It began to be feared that on the thaw taking place, and the ice breaking up, destructive floods would follow the swollen state of the Neva. These letters state that Admiral Hall, the favourite Admiral of the Emperor, recently fell suddenly down in a fit, and expired, at the age of 60. He was formerly a Lieutenant in the British service, and was afterwards made an Admiral in the Russian navy. The Emperor, in honour of a faithful servant, was to attend his funeral.—A letter from the frontiers of Turkey, Feb. 21, in the *Augsburgh Gazette*, says—"All the coast of the Black Sea, and particularly the ports of Sebastopol and Odessa, are in the greatest movement. Masses of troops are directed there for the Caucasus. It is supposed that the Emperor will himself direct the operations, and that he will admit to his headquarters such military men as are experienced in mountain warfare. Amongst others, General Yermoloff is named. The operations are not to be commenced until the arrival of the Emperor on the Kuban, which would seem to contradict the report of his journey to Germany. A letter from Constantinople states that Circassian agents are purchasing up ammunition there at any price."—The 1st of last month being the 100th anniversary of the incorporation of New Russia with the Russian empire, was celebrated with some pomp at Odessa. The *Odessa Journal* gives the following comparative account of the state of the country 100 years back and at present:—"New Russia," says that journal, "100 years ago scarcely contained 100,000 inhabitants, and these were a collection of various bodies living by robbery and violence. The same country now contains 60 towns, 200 colonies of Germans, Bulgarians, Servians, and Jews, 2000 domains and villages, and 1,300,000 souls. The commerce with foreign countries throws every year 25,000,000 silver roubles (the silver rouble is worth about 4f. 50c.) into circulation. The commercial movement of Odessa, in 1843, was 17,141,023 silver roubles, the exports being 7,897,912. Moscow contained in January, 1843, 357,185 inhabitants, and the value of the buildings is not less than 70,000,000 silver roubles, the insurances on which amount to 23,500,000 silver roubles."

TURKEY.—Letters from Constantinople of the 21st ult. state that the Porte appeared little inclined to give the written pledge required by the English and French Ambassadors, "that the punishment of death should not again be inflicted upon Rayahs who having embraced Mahometanism, might subsequently recant its tenets." The Turkish Ministers regarded the demand as an interference with their national independence and their religious laws, and were determined not to yield the point, and abide the consequences of their refusal. The last accounts from Albania intimated that a general insurrection would shortly take place in that province.

UNITED STATES.—The mail steamer Hibernia arrived at Liverpool on Wednesday. She left Boston on the 1st, and Halifax on the 3d inst., and has made an extraordinary short passage. A terrible calamity had happened on board the United States war steamer Princetown, by the explosion of her great gun. It appears that she was on a party of pleasure, and had several hundred guests on board, including the President, the Secretaries of State, and other distinguished persons. The ship had proceeded down the river below Mount Vernon, and on her return, when within 24 minutes' run of Alexandria, the large gun on the bow was fired, it being the second or third time it had been discharged with ball and the usual service charge, when it exploded at the breech and spread death and destruction on the deck. The breech of the gun was severed, and carried away the bulwark of the ship opposite to it. It was the iron fragments, it is supposed, which struck down so many on board, who could not have been behind the gun. The accident took place about sunset. A steam-boat from Alexandria, which was passing, was sent back to town, and returned with several surgeons. President Tyler escaped unhurt, but the following were killed on the spot:—The Secretary of State, Mr. Upshur; the Secretary of the Navy, Governor Gilmer; Commodore Kennon, Chief of the Bureau of Construction of the Navy; Virgil Maxey, Esq., and David Gardiner, of Gardiner's Island, New York; and six sailors are reported badly wounded. One of the President's servants, a coloured man, has since died. Colonel Benton and Captain Stockton, Commander of the ship, were slightly injured. Colonel Benton's injury arose not from any fragment of the gun, but merely from the concussion. He was at the butt of the gun, taking its range when it fired. He was not sensible of its stunning effect until he had called for aid to the bleeding sailors. He was stunned for a time, but was enabled to walk after reaching the shore, and has given a distinct account of the dreadful scene. Capt. Stockton was burnt by the powder, but not much injured. The daughter of Mr. Upshur, several of the family of Commodore Kennon, and the daughters of Mr. Gardiner were on board the steamer, but none of them except Mrs. Gilmer were apprised of the death of those most dear to them until after their return to the city. Almost all the ladies were below at dinner when the catastrophe occurred. Mrs. Gilmer was brought to the city almost in a state of distraction. There were 200 ladies on board, and during the two discharges of the gun were on the deck, and many of them approached very near to observe the course of the ball after it struck the water. If they had not been at dinner at the time the consequences would have been still more alarming; but fortunately no lady was injured. —The Legislature of Pennsylvania have at last made a move in relation to their State debt, and passed a bill providing for the February interest. This bill contemplates the payment of cash when the amount of interest does not exceed 20 dollars, and the issue of 6 per cent. certificates for all larger sums payable in August 1846.—A letter has been addressed by some persons in New Hampshire to Mr. Daniel Webster, requesting permission to nominate him as a candidate for the office of President at the next election. To this application Mr. Webster replied, "I think it my duty, under existing circumstances, to request those who may feel a preference for me not to indulge in that preference."

WEST INDIES.—By the Forth Royal Mail steamer we have accounts to the following dates:—Jamaica 9th, Barbadoes 4th, Demerara 3d, and Trinidad 1st Feb. Private investigation connected with the late robbery at the Jamaica Bank is alluded to as tending to a discovery of the culprit. Her Majesty's schooner Pickle had arrived from Port Royal, with specie for the troops, and was about to proceed to the Coast of Cuba. According to the Demerara papers the weather, notwithstanding its variable character, was on the whole favourable for Agricultural operations. At the meeting of the British Guiana Bank a dividend of 2 per cent. for the half-year had been declared. A slight shock of an earthquake was felt in Demerara on the 19th of January. The Barbadoes accounts give very little interesting news. The weather continued changeable and few of the overdue vessels from England had arrived. At the latest dates appearances indicated either heavy rains or a thunder-storm. From Trinidad, Dominica, and Antigua scarcely a fact comes worthy of record. Sir H. M'Leod, the Governor of Trinidad, had been assaulted while riding out in his carriage by a drunken black, who however, apparently, was unacquainted with the party he had abused, and hence the attendance of his Excellency to ask the redress of his grievance at the hands of the local magistrates had created much surprise among the negro population, when they found that punishment could not be inflicted by the Governor, even where his own person was concerned, without an appeal first made to a court of justice. At Martinique a severe shock of an earthquake had been experienced, but, fortunately, no damage followed.

BRAZILS.—The Petrel Packet arrived at Falmouth on Wednesday from Rio, which she left on the 28th Jan. The Pearl brought despatches from Monte Video to the 15th Jan., which were put on board the packet as she was coming out.—An unpleasant affair occurred at Santos, where Capt. Willis, the commander, and the master of Her Majesty's brig Frolic, after dining with the English Consul, were attacked by several persons. The commander's skull was fractured, the master much bruised, and the steward's arm broken; but they were all reported to be going on well. The commerce of Rio during the past year continued in the same depressed state as in the year preceding, and showed, as regards both imports and exports, none of the symptoms of improvement observable in the great markets of England and the United States.

Parliament.

HOUSE OF LORDS.

Monday.—The Earl of RADNOR presented the Somerset county meeting petition in favour of free trade. Some discussion arose, in the course of which Lord PORTMAN denied that the meeting was a fair criterion of the feelings of the people of the county of Somerset; and the Duke of WELLINGTON expressed a decided opinion that it would be very injudicious to interfere with the present corn-law.—Lord BROUGHAM, in moving the reference to a select committee of his Privy Council Appellate Jurisdiction Bill, made a pointed reference to the remarks which it has drawn forth, especially characterising the charge, that he was carving out a place for himself, as a slander invented by Malice, and her bastard sister Falsehood. He had already three times refused such an appointment. The committee was then nominated, and an instruction was given to it to divide the Bill into two parts, viz., that which establishes a President and two Puisne Judges to the Court, and that which extends the jurisdiction of the Court to divorces *à vinculo matrimonii*.—Lord WHARNCLIFFE, in reply to Lord Brougham, said that the new Houses of Parliament might be rendered capable of accommodating their lordships by the next session of Parliament, if the House of Commons would go to the expense of temporary fittings. It was impossible to have the house ready in a permanent state at so early a period.—The Bishop of PETERBOROUGH, in reply to Lord Lilford, said, that under the Church Discipline Act he had no power of interfering in the case of the Rev. Herbert Marsh, as the act restricted his jurisdiction to two years, and the immorality complained of had occurred four years ago. The individual, however, who had caused this scandal, had not officiated for a long time his duties having been performed by a curate.

Tuesday.—On the motion of Lord COTTENHAM, a committee was appointed to consider a petition from the Dissenters of Dublin, praying that the Bill lately laid on the table of the House, respecting the property of Dissenters, which consisted of chapels and burial-grounds, might be extended to Ireland.—Lord MONTEAGLE moved for returns relating to the Roman Catholic College of Maynooth, and entered into a statement of the past and present condition of that seminary, with the view of urging on the Government the necessity of enlarging the grant, and resorting to other means with the intent of elevating the clergymen there educated.—The Duke of WELLINGTON made no objection to the production of the returns, but expressed his regret that the statement had been made by Lord Monteagle before the necessary papers were before their Lordships. "My Lords," said his Grace, "I am not now in a position to state —fearing I should only deceive your lordships—that it is the intention of the Government to make any alteration in this grant, but, undoubtedly, the Government must take the whole subject into their consideration; though I am not authorised to say that any alteration will be made in the grant, and of course, if any such intention shall be announced, it will be announced, in the first instance, in that quarter where the grant must originate."—The Marquess of LANSDOWNE thought that, for the purpose of giving an efficient and enlarged education to the Roman Catholic clergy, it would be necessary that this grant should be greatly increased.

Thursday.—Lord PRUDHOE presented several petitions from Northumberland, praying for protection to Agriculture.—Petitions deprecating the proceedings of the Anti-Corn Law League were presented by Lords SONDES and FEVERSHAM.—On the motion of Lord COTTENHAM the Committee on Chapels, &c. (Dissenters), Bill was nominated.

Friday.—After the presentation of petitions against the union of the Sees of St. Asaph and Bangor, and the York and Scarborough Railway Bill, Lord CAMPBELL called attention to the case of the Rev. Mr. Marsh, and the Bishop of PETERBOROUGH explained that he could not have proceeded against him at an earlier period, because he was not aware of the facts. He was truly gratified to say that immorality in the Church was the exception, and not the rule; and he was satisfied that the manner in which the Government and their Lordships disposed of their patronage would be of great benefit to the Church. After a few words from Lord LILFORD, the conversation terminated.—The Three-and-a-Half per Cent. Annuities Bill was brought up from Commissioners, as was the Consolidated Fund (8,000,000*l.*) Bill, both of which were read a first time.—Lord COTTENHAM laid on the table the report of the Select Committee on Dissenters' Property Bill. It recommended that the provisions of the bill on the subject should be extended to Ireland.

HOUSE OF COMMONS.

Friday.—After the adoption of the Chancellor of the Exchequer's proposal for the reduction of the 3½ per Cents., to the justice of which Mr. F. Baring (the late Chancellor), Sir J. Easthope, and other members on both sides of the House bore testimony, the House proceeded with the order of the day for going into a Committee of Supply.—Mr. EWART called the attention of the House to the commercial relations of England with the River Plate. He enlarged upon their importance; he urged the necessity of some endeavour to terminate the quarrels of Buenos Ayres and Montevideo, and he requested some information respecting the prospect of such an adjustment.—Sir R. PEEL agreed in deprecating the continuance of the hostilities between the South American states and parties; the mediation of England however had been tried, but without effect; and armed intervention was not a course which she ought to attempt. He believed however that the reverses sustained by one of the parties were now likely to lead to a pacification.—On the motion that the Speaker should leave the chair, in order to go into Committee of Supply, Mr. S. CRAWFORD protested against proceeding to vote away the people's money while the people continued to be insufficiently represented in that House.—The House then resolved itself into Committee, and proceeded with the estimates.—The report of the Commissioners of Inquiry into the state of South Wales was laid on the table.

Monday.—Mr. O'CONNELL gave notice for an early day after Easter to bring in a bill to define the law of conspiracy, and the taking of evidence relative thereto; also, for a bill to repeal all the laws relating to landlord and tenant that had been passed for Ireland since the Union, and to enact that no landlord in Ireland shall have power to levy a distress for sums under 20*l.*, except on a lease of lives, or a lease of not less than 21 years.—The CHANCELLOR of the EXCHEQUER corrected a mistake which has been made respecting the power of Parliament over that portion of the Three-and-a-Half per Cents. which is known as the stock of 1818. It had been supposed that it could only be paid off in amounts of 500,000*l.* at a time, and would, therefore, require ten years for its entire discharge. The fact was that the whole stock of 1818 could be paid off at six months' notice; but not less than 500,000*l.* was to be paid off at any time, under this power. The report on the Three per Cent. Annuities Acts was then brought up; and leave given to bring in a bill founded on the resolu-

tions.—On the bringing up the report on the Committee of Supply, Captain BERNAL moved for a copy of any letter or correspondence which has passed between the Secretary-at-War and the widow of the late Lieut.-Col. Fawcett, relative to the withholding of her pension. He alluded to the utter dead letterism of the article of war prohibiting duelling; reminded the House of the terms and nature of the challenge sent by the Duke of Wellington to the Earl of Winchilsea, which was conveyed by Sir H. Hardinge; and stated that, if Col. Fawcett had sold his commission one week before his death, his widow would have had 3200*l.* at her disposal. Mr. Attorney-General Smith had made a manly apology, and was not debarred from legal promotion, and he appealed to the House, amid general cheers from both sides, that Mrs. Fawcett should not be the first victim of a rigid application of the rule.—Sir H. HARDINGE explained that there were special circumstances in the case of Lieut.-Colonel Fawcett, which brought it within what was the general rule and practice of the War-office. The near relationship of the parties rendered this unfortunate duel one of those in which precedent ruled the refusal of the pension; there were no palliating circumstances which could mitigate censure on the conduct of brothers-in-law, who hastily rushed out to shoot one another, on account of differences which might have been settled easily in another manner; and the Government, though anxious to manifest their respect for the memory of a gallant officer, by giving the most favourable construction to the claims of Mrs. Fawcett, were yet of opinion that they could not consistently grant the pension. He had received Her Majesty's sanction for an amendment of the Articles of War relating to duelling, and he read the terms of the contemplated alterations, which are to take effect during the present year, and are as follow:—"We hereby declare our approbation of the conduct of all those who having had the misfortune of giving offence to, or injured, or insulted others, shall frankly explain, apologise, or offer redress for the same, or who, having had the misfortune of receiving offence, injury, or insult from another, shall cordially accept frank explanations, apology, or redress for the same, or who, if such explanations, apology, or redress are refused to be made or accepted, shall submit the matter to be dealt with by the commanding officer of the regiment or detachment, fort, or garrison, and we accordingly acquit of disgrace or opinion of disadvantage all officers and soldiers, who, being willing to make or accept such redress, refuse to accept challenges, as they not only have acted as is suitable to the character of honourable men, but have done their duty as good soldiers, and subject themselves to discipline. Every officer who shall give or send a challenge, or who shall accept any challenge to fight a duel with another officer, who, being privy to an intention to fight a duel, shall not take active measures to prevent such duel, or who shall upbraid another for refusing, or for not giving a challenge, or who shall reject, or advise the rejection, of a reasonable proposition made for the honourable adjustment of a difference, shall be liable, if convicted before a General Court-Martial, to be cashiered, or suffer such other punishment as the Court may award. In the event of an officer being brought to a Court-Martial for having acted as a second in a duel, if it shall appear that such officer had strenuously exerted himself to effect an adjustment of the difference on terms consistent with the honour of both the parties, and shall have failed through the unwillingness of the adverse parties to accept terms of honourable accommodation, then our will and pleasure is that such officer shall suffer such punishment as the Court may award." These regulations, he thought, would tend to check the practice of duelling, which was already greatly on the decline in the army, as compared with former years; but these amended articles are not to apply to half-pay officers, for he would not be a party to any restraint being laid on military men in private life to which other gentlemen were not subjected.—Mr. T. DUNCOMBE read a statement by Lieut. Munro, in which he alleged circumstances in order to show that he had strenuously laboured to avoid the unhappy alternative of meeting his relative, for whose death he expressed the deepest contrition. But he had been driven into it by the imperious calls of that barbarous code of which his superior officers were amongst the most determined supporters. If we wished to put an effectual stop to these proceedings, we must go a step farther, and include half-pay officers within the operation of the new regulations.—Sir C. NAPIER expressed an opinion that the proposed new Articles of War would be ineffectual. Seconds to a duel ought to be made as amenable as principals; and "good shots" in pistol practice, an accomplishment not absolutely essential in the army, should be rendered peculiarly liable to punishment. But in making new laws against duelling, he would not look exclusively to the army. Civilians ought to be controlled as much as military men; and he would punish them all for duelling, from the First Lord of the Treasury downwards. But nothing would so effectually stop the practice as a regulation prescribing firing across a table, one pistol being shotted and the other loaded with a blank cartridge; we might thus let the one duellist be shot and then hang the other.—After a few words from Colonel WOOD, Lord PALMERSTON thought that as Colonel Fawcett was the challenged and not the challenger in this unhappy transaction, his widow might have been favourably considered at the Horse Guards, unless there were circumstances privately known to them which precluded it. But after all, seconds in a duel, acting as they did, with the honour of the principals in their hands, ought to be charged with serious responsibility. As to the new Articles of War, if they were not enforced more stringently than the existing ones, which were sufficiently rigid, he feared that little would be done to check the practice of duelling.—Sir R. PEEL briefly adverted to the circumstances in which the duel originated. Colonel Fawcett had grossly insulted his relative, turning him out of his house in presence of servants; he had selected for his second a very young man, inferior to him in years, rank, and experience, and who could not be supposed to exercise any influence over the mind of his principal; and all these circumstances justified the Government in the course which they had adopted, and which was intended to mark a decided disapprobation of such transactions. As to Lieutenant Munro, he had allowed two sessions to pass over without submitting to an inquiry into his conduct before a legal tribunal, and was therefore properly visited with supercession. The new Articles of War were calculated to prevent the recurrence of similar scenes; and he hoped that they would receive general approbation, as tending more effectually to the repression of duelling.—Mr. BERNAL was of opinion that there were circumstances in this affair not generally known, by which Lieutenant Munro, under the operation of the conventional code of honour, and acting on the decided opinion of officers of high rank, was placed in a situation from which he could not escape, nor avoid the responsibility of calling out Colonel Fawcett. He hoped that the Government would reconsider the case of the widow, who was the unhappy victim of a system deriving its sanction from the general feelings and practice of society.—Lord HOWICK, objecting to duelling generally, as an unchristian, unnecessary, and barbarous practice, did not think that the tone of the debate was calculated to lower or discredit it in public opinion. He argued at some length, that unless a more decided and comprehensive course was to be adopted for the suppression of duelling, it was extremely hard to deprive Mrs. Fawcett of her pension.—After some observations from Lord C. FITZROY, Mr. COWPER expressly declared that on religious grounds he would refuse to fight a duel, considering the practice condemned by the law of God as well as of man, and not to be justified under any circumstances whatever. There was precedent in the history of the army (as a case which occurred in 1783) for giving facilities for constituting a Court of Honour, to which all inquiry might be delegated, and which would take upon itself adjudication with respect to personal quarrels.—Sir R. H. INGLIS paid a compliment to Mr. Cowper, whose declaration he had heard with great pleasure. But he complained that Sir J. Graham, when waited upon by himself and others, as a deputation, with a memorial to her Majesty, praying that the Government would take some measures for the more effectual discountenancing of duelling, had returned a cold official answer.—After some farther discussion, in which Mr. O. STANLEY, Mr. TURNER, Lord R. GROSVENOR, and Mr. BROTHERTON took part, the motion was withdrawn, and the report on the committee of supply was received.—Mr. O'CONNELL asked leave to bring in a bill to alter and amend the law relative to Roman Catholic charities, and the tenure of lands for the purposes of Roman Catholic worship in Ireland. He very briefly stated his objects; and, after a few remarks from Mr. SHAW, leave was granted, Mr. O'CONNELL saying that he only at present wished the bill to be printed, and he would move the second reading on the 19th of April.—Mr. HUME then moved for a select committee to inquire into the present state of the law relating to the tobacco trade, and the best mode of checking smuggling in the article. After a few remarks from the CHANCELLOR of the EXCHEQUER and Mr. F. BARING, the motion was acceded to.

Tuesday.—In reply to Mr. GILL, Sir H. HARDINGE explained the circumstances under which two officers of the 76th Regiment had been arrested in July last, and kept ever since under arrest at Devonport, by order of the Commander-in-Chief. One of them, a junior officer, was the bearer of a challenge to a senior officer, which the latter accepted; both having thus violated their duty, therefore rendered themselves liable to arrest; but the Commander-in-Chief, as their punishment had continued so long, and bearing in mind that the aggressor was under 18 years of age, meant to release them immediately, after a suitable admonition.—Mr. COBDEN submitted his motion to the House for a select committee to examine into the effects of protective duties on imports, on the interests of the tenant-farmers and farm-labourers of this country. He argued that there was no danger of such a fall of prices as would throw land out of cultivation, and that the parties who profited by the high prices arising out of the present law were not the farmers, but the speculators. He denied that corn could be grown abroad, or conveyed from foreign countries hither, at the low rates generally supposed. Corn could not be brought from Dantzic at less than 10*s.* 6*d.* a quarter when all charges were included, and this was a tolerably large protection to the English farmer, who had his market at his own door. Every prediction now uttered about corn had formerly been uttered about wool; but was there at this day a lack of mutton? Were all the sheep-dogs dead, and all the shepherds in the workhouse? So far from it that, when wool was at the highest price, the largest quantity had been imported; when at the lowest price, the smallest quantity. A high price from prosperity might be permanent; a high price from scarcity never could. The diminished consumption of one great town in distress did more to reduce prices than the importations of the whole Continent. He did not believe that the tariff had lowered prices; that pretence was only set up to enlist the fears of the farmers against reduction of the import duties. The landlords went about assuring their tenants that even if the land were let rent-free, the competition of foreigners could not be resisted; but there was a larger margin than they avowed, for the proportion of rent to other expenses was about one-half. He could prove that out of 52*s.* per quarter paid for wheat in the Lothians 26*s.* went to the landlord; and so likewise throughout England, half of all that was eaten went to the landlord. But it was not the Corn-law that gave the landlord these large rents; they would be equally large if there were no such laws. Now, as to the labourers. Their wages were too low, and consequently their diet and whole maintenance were insufficient. And the further south he went from the much-maligned district of tall chimnies the smaller he found the wages and the worse the condition of the labourers. He could prove that when the price of corn was highest, wages were lowest and employment scarcest. In the last 50 years rents had increased three-fold: what had been the increase in wages? 150 years ago, the wages of a labourer in Gloucestershire were 10*s.*, wheat being then at 36*s.* a quarter; wheat now costs between 50*s.* and 60*s.* a quarter, and the labourers' wages were under 9*s.* The lodging of the poor was a matter in which the character of the landlord was still more implicated than in their food; and as to lodging, he instanced some cases of very unwholesome, unseemly, and indecent crowding in bedrooms. There might be crowding in towns, too, but then in towns there were no individuals having control over the land and houses; whereas in the rural districts the landlord had the whole ownership of the cottages, and their wretchedness was his disgrace. This wretchedness in the rural districts was no accident of temporary distress; it was their permanent state, and the fear of falling into this permanent state of the rural labourers was what caused the strikes of the workmen in the towns. It was not the farmers who were responsible for all this; they could not afford to give larger wages than they gave. But on those wages the labourer was starving, and this starved population formed the body who were held out to the manufacturers as the valuable class of home customers! He dwelt especially on the miserable state of the labourers in four of the southern counties of England, whence he passed to Scotland and to Wales; and observed that even in Ireland, where misery was proverbial, there was a duty on the importation of corn. Did this general state of your population form a case on which to justify the Corn-law? If you could show a thriving agricultural population, the manufacturers might submit to some disadvantage for the prosperity of their fellow subjects; but with such a population as this, he wondered that the opposition to the required change was not abandoned for very shame. He wanted not a commission, but a select committee, for which the House, as now constituted, could furnish members of great information, and of great experience on this particular subject. He should like to see the great landlords produced before such a committee; let Lord Ducie and Lord Spencer be called on the one side, and let him be at liberty to cross-examine the Dukes of Buckingham and of Richmond on the other. He had no objection to have a majority of protectionists on the committee; nor did he wish to sit in the chair of it. On what ground was such a committee to be refused? The danger of excitement? There would be much more excitement occasioned by the refusal than by the concession of it.—Mr. GLADSTONE praised the moderate tone of Mr. Cobden, but could not see the connection between his speech and his motion. Both sides of the House felt deeply on the subject of the condition of the agricultural labourers, and landlords were anxious to ameliorate it. The proposed committee, instead of aiding in the development of agricultural improvement, would be made a party handle by the opponents of the Corn Law. He did not deny the truth of many of Mr. Cobden's propositions, as in the case of wool; but he questioned the calculations he had adduced as to the prices of agricultural production, and the relation which produce bears to rent. It was the great fault of the school of political economy to which Mr. Cobden belonged, that it looked upon man in the abstract, and talked of his transference from place to place, without reference to early and local associations, family ties, &c.; in fact, they looked exclusively to production, and forgot distribution. But Mr. Cobden had not traced the enhancement of price to the Corn-law; and his present statement of the slight effect which free-trade in corn would have on price was very different from the language he was in the habit of holding elsewhere. Even the allegation of fluctuation of price, as attributable to the Corn-law was a questionable proposition. It could also be demonstrated that the interest of the landlord was the least in the cultivation of the soil; the other two parties, the farmer and the labourer, affected as they would be by an alteration in the proportion of capital and labour applied to its cultivation, had a greater interest. The question was not whether distress might exist coincident with a corn-law, but whether the Corn law was the cause of that distress. Nor could he see what good result would arise from delegating an investigation into the abstruse doctrine of rent to a select committee—a question which ought rather to be previously settled with the masters of political economy, the Ricardos of the science. As little benefit would arise from the inquiries of 15 gentlemen into so comprehensive a subject as the condition of the agricultural population of the United Kingdom. The inquiry might be protracted from session to session—especially if the committee had a majority of protectionists on it, as Mr. Cobden seemed willing to allow. So long as agitation was confined to the surface, this country could bear a larger amount of it without detriment than any other, and notwithstanding the activity of the Anti-Corn-law League, there was a general impression that its agitation consisted more in parade and ceremonial than in reality. Still, he was opposed to the granting of this committee, if not for the agitation, at least for the apprehension which it would create. It would excite fears of farther changes and legislation on a subject on which security was essential to the progress of agricultural improvement and the employment of the agricultural labourer; and on these and other grounds he resisted the motion.—MR. HAWES considered that the refusal of the committee, accompanied by the speech of the right hon. Gentleman, was only an invitation to agitation. The landlords could not have faith in the stability of the present law, and therefore they were depressing enterprise by adhering to it.—Lord POLLINGTON believed there could be no greater blessing to a people than free trade; but for it to be a blessing it should be really free, and not that freedom which consisted in admitting the productions of countries that systematically placed prohibitory duties on our productions. He hoped the time would come when all countries would agree to trade together without import duties at all.—Mr. SCOTT, as a Scotch Member, opposed the motion, and argued that while the landlords derived small profit from their capital the gains of the manufacturers were enormous. The poor man's capital was his labour, and they were determined to defend it against those who sought to deprive him of it. The high wages which it was boasted were paid in the manufacturing districts were not maintained during the year; and while the average duration of life in the rural districts was 38 years, in the manufacturing it was only 17. If the price of corn would not be materially reduced by free trade, what was all the agitation about? He strongly denied that the Scotch farmers were in favour of the doctrines of the Anti-Corn-Law League.—Lord WORSLEY adduced some documentary evidence in order to show that Mr. Cobden's statistics as to the relation between produce and rent were erroneous. In Lincolnshire the labourers were well paid and fed, and they were consequently more contented, more willing, and industrious; similar results would follow similar treatment in other counties. The motion would be a revival of the Import Duties Committee, and its inquiries would be very different from its professed object, and therefore he could not support it.—After Mr. COCHRANE had explained that Mr. Ferrand was detained in Yorkshire, and was not therefore able to be present to move an amendment, Mr. CURTEIS and Col. WOOD opposed the motion; Mr. BROTHERTON and Lord SHELBURNE supported it.—Colonel SIBTHORP expressed his amazement that Mr. Cobden should have brought on this motion instead of appearing with his white wand at the O'Connell dinner. The agricultural agitators now rising up to confront the delusions of those miserable individuals who composed the Anti-Corn-law League, were *not* going to ride like quack doctors through the country, nor to circulate the atrocities of the *League*, a paper he would not tolerate on the table of his house. He would vote for the motion if he thought it were sincere; but it was only another specimen of the humbug by which Messrs. Cobden and Bright tried to gain credit by speeches for being friends of the poor. We were better Christians, friends, and neighbours, in the good old times, when we had more agriculture and fewer manufacturers.—Mr. VILLIERS remarked upon the silence of the members connected with the Anti-League Associations. He insisted upon the evidence adduced by Mr. Cobden of the distress prevailing among the labourers. The population was rapidly increasing, and the means of their employment were not; and this was not a state of things which could be cured by sitting still and doing nothing.—Mr. BANKES would willingly vote for the motion if he thought, as he did not, that it would do any good to the agricultural labourer, whose condition, he admitted, required improvement. He went into details on the subject of the condition of the Dorsetshire labouring population; and adduced the silk trade as one ruined by free trade. The motion was one intended to unite the incoherent elements of the opposition.—Mr. BRIGHT had heard nothing to invalidate any one argument of Mr. Cobden, whose motion, whatever might be its fate in the House, would receive the general approbation of the country. The Anti-Corn-law League was accused of exciting the people; they did, and they would. It was impossible to go amongst the agricultural population, and advert to their condition, without exciting them. All the expectations and promises of all the promoters of every Corn-law since 1815 had been falsified in experience, and had only led to one result—the ruin of that industrious and deserving body, the tenant farmers of this country. This was their case, and to prove it or to confute it, he asked them to go into committee and inquire into the facts. Was it wise to uphold the Corn-law until the pressure, from increased population and pauperism, compelled them to abandon it? It had become the scorn of all intelligent men abroad, and the hatred of masses at home; and the question would come back to them again and again; every constituency should know that they sat in that House to legislate in order to keep up the price of corn.—Mr. NEWDIGATE charged the Anti-Corn-Law League with having excited the disturbances in the manufacturing districts, especially in Warwickshire; and read extracts from letters and addresses to prove that it was linking itself with objects ulterior to the repeal of the Corn-laws.—Dr. BOWRING repelled the charges brought against the Anti-Corn-law League; and, after some remarks from Mr. O. STANLEY, a division took place, when there appeared—For the motion, 133—Against it, 244—Majority, 91.—On the motion of Mr. GLADSTONE, the House went into committee on the laws relating to the making of gold and silver wares, and a resolution was passed to remove the penalties now in force, and to afford some effectual control and security over the dealers in such articles.—The House also went into committee on the law respecting international copyrights, and passed a resolution to enable her Majesty to confer on foreigners the same privileges with respect to copyright in this country as were possessed by British subjects.

Wednesday.—The SPEAKER informed the House that the petition against Mr. L. Bruges' return was withdrawn,—Mr. ELPHINSTONE postponed the second reading of his Court of Arches Bill, to give time for the Government Bill on the same subject to come down from the other House. A discussion then took place on the second reading of Lord Worsley's Inclosure of Commons Bill, which was opposed by Mr. S. CRAWFORD, who objected to the wholesale power which the bill would confer in depriving the people of their rights of commonage, and moved that it be read a second time that day six months. He was seconded by Col. SIBTHORP, who opposed the bill *in toto*, and declared his determination to take the sense of the House on every one of its 149 clauses. A discussion followed, various Members supporting the bill with qualification, others opposing it entirely.—Mr. HUME was averse to the deprivation of the rights of commonage, looking to the health of the inhabitants of populous places and the general comforts of the people.—Sir R. PEEL agreed in many of the observations of Mr. HUME as to securing commonage for the inhabitants of all populous places, but pointed out that there was much of the waste land of the country which could be profitably inclosed under the powers of the bill, which therefore should be allowed to go into committee for deliberate consideration. The second reading was carried by 70 to 23.—The Masters and Servants Bill, the Teachers of Schools (Ireland) Bill, and the Three-and-a-Half per Cents. Bills severally passed through Committee.

Thursday.—After various notices of motion Mr. W. O. STANLEY read a letter from Mrs. Munro, in correction of a mis-statement made by him on a former night, in which she exonerated all the

officers of the Royal Horse Guards from the slightest blame in the late melancholy duel.—Mr. COCHRANE adverted to the recent proceedings in Greece, which, he contended, were improperly characterised by the word *revolution*, inasmuch as they were but a following out of the principle of independence, which was the origin of Greece as a kingdom. He moved for the correspondence, or extracts from it, between England, France, and Russia relating to these events.—Sir R. PEEL said that France and England had done nothing more than to endeavour to secure for Greece a constitution, based on such a popular representative system as was consistent with the stability of a constitutional monarchy. He declined entering into details on a subject which was still a matter of negotiation; but he was willing to consent to the production of such portions of the correspondence as would not prejudice the proceedings still in progress.—Lord PALMERSTON agreed generally with Sir R. Peel, and hoped that the selection from the correspondence about to be produced would be as large as possible. It had been said that Greece was not fit for a representative Government; but that was always the argument of despots, and the best way to settle the dispute was to concede representative Government as soon as a people demanded it. The independence of Greece had been guaranteed by the three Powers; but one of the articles of the new Greek constitution, under discussion in the Greek Assembly, was, that the successor to the Greek throne should be a member of the Greek Church. Now, the next brother of Otho was a Roman Catholic, and therefore this part of the subject required the attention of those who had guaranteed the independence of Greece, if they did not wish to see it fall into the arms of Russia. He paid a compliment to the sagacity of the late Government, in appointing so able and industrious a diplomatist as Sir Edmund Lyons.—Sir H. DOUGLAS said that the late revolution, in his view, was a military movement, and he concurred in many of the observations of Lord Palmerston.—Sir R. H. INGLIS argued that it was desirable that the Church of Greece should be entirely independent; but he did not think it was convenient that the House should discuss the details of the Greek constitution at a moment when they were already under deliberation by the constituted authorities in that country. He could not agree with the noble Lord in his sweeping proposition, that in any country whatever, even China or Japan, it was only necessary to introduce free institutions in order to fit the people for their enjoyment. He thought this was a proposition which, coming from the authority which it did, should not be tacitly assented to by the House. With respect to the appointment of Sir E. Lyons, he thought, looking at the conduct of that gallant officer, that no appointment had ever been made by the noble Lord which was so wholly unobjectionable as that one. In his opinion, Sir E. Lyons was entitled to represent England and its interests, not only on account of the diplomatic abilities which he had displayed, but from his having throughout united the high character of an English gentleman with that of an eminent officer. The noble Lord had said that Greece was entitled to claim a constitution. More than that, the King himself had ten years ago promised to give a constitution, and it was by virtue of that pledge he continued to govern that fine and glorious country. Yet he believed that a grosser system of tyranny had been exercised in that country during those ten years, than in any other country in Europe for a century. He would not stop to inquire whether what had happened on the 15th September was worthy of the name of a revolution; but it was of such a nature as to recommend anything even bearing that name to him. He should not go along with his gallant friend in saying that it was merely a military movement. He believed the revolution was prepared by the scarcely endurable despotism of the King, and that the soldiers shared, but did not lead the feeling of the country.—Sir R. PEEL joined in the tribute paid to Sir E. Lyons.—After some further discussion, Mr. COCHRANE, in reply, said that the article relating to the succession to the Greek throne had been already settled by the National Assembly. The motion for the production of extracts from the correspondence was then agreed to.—Mr. MILNES then called the attention of the House to the present state of criminal jurisdiction over British subjects within the dominions of the Porte. He complained of the defects in the Foreign Jurisdiction Bill with reference to the Levant, and pressed his amendment on the consideration of the Government.—Mr. HOPE said that the Government were collecting information on the subject, with a view to a revision of the law.—Dr. BOWRING and Sir R. PEEL joined in the discussion of the subject—the latter deprecating the present state of the law, and professing his desire to bring it more within the principles of British jurisprudence, to which the Government were addressing themselves, with a view to remedial measures.—Lord PALMERSTON pointed out the importance of the subject, and expressed his conviction that the Government were pursuing a right course.—Mr. MILNES replied; and the motion, after a few additional remarks from Sir R. PEEL, was withdrawn.—Mr. TURNER submitted a motion, calling upon the House to adopt a resolution to the effect that duelling was immoral in its tendency, that it brought into contempt the laws of the country, was contrary to the Divine command, and ought to be abolished. He traced the history of duelling, suggested that the rules recently introduced into the Articles of War should be extended to all the civil servants of her Majesty, who were much more pugnacious in this respect than her military servants; likewise that the survivor of a duel should be made to pay the debts of the deceased, and be liable for an action in damages by the next of kin; also that duelling should be declared manslaughter, and made punishable as such. Mr. Turner said he made his motion preparatory to bringing in a Bill on this subject.—Mr. EWART thought two years' imprisonment as a minimum, and fourteen years' transportation as a maximum, the proper amount of punishment.—Mr. COWPER recommended the institution of a Court of Honour, in order to adjudicate upon all those differences for which the practice was the general solution. Most persons who fought duels did so with regret or aversion, and were mainly actuated by a fear of the ridicule of society.—Sir R. PEEL doubted if any legislation on duelling would be efficacious. He feared that any attempt to deal with it in the way proposed would rather encourage than put an end to the practice. As to the establishment of a Court of Chivalry or Honour, he did not think it would be practicable. The fact that 380 persons of the highest honour, numbering among them many Generals and Admirals, had combined for the purpose of discountenancing the practice of duelling, would be a more effectual discouragement than any law against an offence so difficult to deal with. The declaration by these gentlemen that they will neither send nor accept a challenge, was more likely to produce an effect on society and an alteration in the public feeling than any legislation. It was this consideration which had restrained the Government from bringing forward any law on the subject, while they were by no means desirous of preventing a fair and dispassionate consideration of any measure which might be introduced.—After a discussion, in which Lord R. GROSVENOR, Mr. HUME, Mr. PLUMTRE, Mr. WARBURTON, Mr. BROTHERTON, and Sir T. D. ACLAND took part, Mr. TURNER withdrew his motion.—Mr. ELPHINSTON moved a Committee of the House to take into consideration certain Acts, with the view of imposing the same amount of probate duty on real estate as is now in similar cases imposed on personal property; and likewise of considering the expediency of imposing a probate duty in all cases on the death of the *cestui que* trust (whether the trust property be realty or personalty); in order to substitute such proposed probate duty on real estate for some of those taxes which now press most heavily on the protective industry of the people.—The SPEAKER having expressed considerable doubt of the formality of the motion, it was withdrawn, with the intention of being brought forward on a future day.

Friday.—On the second reading of the South Eastern and Hastings Railway Bill, Mr. HOPE moved that it be read a second time that day six months, but after some discussion the amendment was withdrawn, and the second reading carried. The Three-and-a-half per Cents. Bills were read a third time and passed. After some conversation about the alleged exclusion of Catholics from Juries at the Monaghan Assizes which Lord ELIOT declared was not on account of their religion, Sir J. GRAHAM, in reply to Lord J. RUSSELL, said that he would next week fix a day for bringing in his bill for the extension of the county franchise in Ireland.

CITY.

Friday.—The public securities are firm, and Consols were last done at 98½. No price has been marked for the New Three-and-a-Half per Cents., and the reduction of the rate of interest is virtually carried without producing any commotion in the Money Market. Exchequer Bills are 72 prem.

GAZETTE OF THE WEEK.—BANKRUPTS.—J. SCHOLEFIELD, 39, Cheapside, City, cutler—W. SMITH, late of 6, King-street, St. Giles's, but now of 399, Strand, printer—T. ADAMS, of Newport, Isle of Wight, publican—C. EICKE, late of Rotherhithe, Surrey, and of Park-street, Westminster, iron rivet manufacturer—A. SPARKE, 28, Jewin-crescent, Jewin-street, City, wine-merchant—W. POTT, of Macclesfield, Cheshire, silk throwster—T. MILLAR, of Liverpool, hosier—R. ARSOP, of Manchester, grocer—R. CROWDER, of West Auckland, Durham, iron-founder—W. SMITH, of Nottingham, smallwareman—G. WOOD, of Ingram, Northumberland, banker—G. LIMBERT, of Boroughbridge, Yorkshire, shopkeeper—C. A. STOREY, of Leeds, corn-merchant—J. BELL, Norwich, surgeon—C. SAVILL, Romford, Essex, grocer and cheesemonger—T. E. LUBBOCK, Butcher-hall-lane, Newgate street, victualler—J. FOAKES, Mitcham, Surrey, market-gardener—J. R. JONES, Newbridge, Monmouthshire, grocer—A. DAKEYNE, Bolton-le-Moors, Lancashire, smallwaredealer—J. WALKINGTON, Chapeltown, Leeds, joiner—J. WADE, Birmingham, paper-maker—G. CARAUTHERS, Coventry, draper.

Metropolis and its Vicinity.

Dinner to Mr. O'Connell.—On Tuesday evening a public dinner was given to Mr. O'Connell in Covent Garden Theatre. About 1200 persons sat down to dinner, the tables being arranged in such a manner as to accommodate the greatest possible number of guests. Mr. T. S. Duncombe, M.P., took the chair, supported on his right by Mr. O'Connell, and on his left by the Earl of Shrewsbury, and the Hon. C. Langdale. Lord Camoys and Lord Dunboyne were also present, with the following Members of Parliament:—Hon. F. H. Berkeley, Sir J. Easthope, Sir R. W. Bulkeley, Messrs. Collins, Serjeant Murphy, Ross, Tancred, Metcalfe, M. J. O'Connell, Crawford, Wynn Ellis, Blake, Gisborne, Hindley, Pattison, Roche, Williams, Blake, Dennistoun, Elphinstone, Holland, Scholefield, Butler, Sir V. Blake, Somers, and Bowring. Senor Olozaga, the exiled Minister of Spain, was also present. Previous to dinner the Very Rev. Dr. Magee, chaplain to Mr. O'Connell, said grace. The chairman in proposing Mr. O'Connell's health referred to the state of Ireland, and declared that if Government imprisoned that gentleman, the petitions of millions of the people would proclaim his liberation from within the very walls of Parliament itself. The whole company here rose, and from the point where the chairman sat to the opposite side of the house, and the very top of the gallery there was one moving and hurraing mass of human beings. The ladies in the boxes all rose and waved their handkerchiefs, whilst the shouts of the men seemed as though its reverberations were never to cease. At length something like silence was obtained, and Mr. O'Connell rose and said—"I protest that in my long and varied life I never was so embarrassed as I am at this moment—in truth I am not ashamed to say, I am almost unmanned—my feelings are overpowered. The dungeon has no terrors to my mind—and if to it were added the scaffold and the rack, they could not appal me after the awful magnitude of the compliment you have paid to me. The accusation which has been made against me, and upon which I have been convicted, is of such an enormous nature, that it is interesting to every human being, whether he be himself liable to a similar machination or not, to understand distinctly its bearings, its form, and its breadth. It is not a crime defined by the law, or definite—it is not a crime respecting the evidence of which there is any possible resort to law-books, or to the conjurations of men of my trade. It is called, to be sure, a conspiracy; but there is nothing of private agreement—there is nothing of arrangement—there is nothing of plot or plan in it—it is something that the Judges imagine when they dream, and make the public suffer when they are awake. The conspiracy which has been tried in Ireland, is the Frankenstein of the law. As the one is uncouth of limb, unshapen in form, undefined and indefinite in nature, having nothing of humanity about it—so the other has nothing of law but its monstrosity. How was it endeavoured to be supported? By the history of nine months. What plot did it disclose? Why, a plot which was carefully committed to those keepers of secrets, the public newspapers. Not one witness was produced to prove any fact, except that A and B were the proprietors of newspapers, and that they were members of the association, and then the newspapers were read in detail against us, and the Judges determined that that was evidence of a conspiracy; and here I stand before you a "convicted conspirator." The history of nine months was given in this satisfactory manner. The chronology and dates of newspapers were all that varied from one week to another. The history of only one great meeting was detailed as it had appeared in the public prints. Was it alleged that any one of them was illegal—that there was force, or violence, or turbulence, or tumult at any of them? Not a particle of any such allegation could be made. Was it alleged that the magistracy of the country or the civil power of the country, or the idle or the timid, were intimidated or frightened at any one of these meetings? There was not a single allegation of the kind. The meetings were peaceable—they were legal—every one of them was admitted to be legal—but, by the dexterity of legal magic, though the 41 were perfectly legal, yet the whole, taken together, formed a conspiracy. It is literally a mockery to say that 41 legal meetings made one illegal one. Forty-one cyphers would not make a sum, and yet the law was so decided in our case that 40 nothings made something. Was it not to be looked on with scorn and indignation, and were not those men who planned this conspiracy, with trickery worthy of Old Bailey practitioners, themselves conspirators, and ought they not to be branded with infamy? What was called law to-day might be forced into a precedent to-morrow; and if the question be allowed to repose, there is not one of you whose case it might not be to-morrow. My next impeachment is the omission of the names in the Jury list. Out of 710 names, 63 slipped by accident! We had a lot of them, and out of the entire number of names, 63 were absent. It was said to be an accident, but out of the 63 names that were omitted, 27 of them were Roman Catholics. We challenged the array, as it is called, on account of the sixty-three names. We alleged that those names were fraudulently taken from the list. We alleged that it was done to the detriment of the traversers. That plea was put on the record; the Attorney-General had power to join issue on that allegation, and say that it was not in fraud. That issue would have been tried by triers duly sworn. The Attorney-General declined that issue. He left the allegation to stand uncontradicted, and it stands uncontradicted to this day. He relied on this, that he had Judges who would tell him, as they told us, that as we did not know who had committed the fraud, we were without remedy. It is literally true. I am here talking to the common sense of Englishmen—their sense of honesty, and above all things to that noble adhesion to fair play, which is the highest and most dignified trait in the English character. There remains one impeachment more of these proceedings, and that is my impeachment of the Jury sworn. In point of law, Catholics and Protestants had an equal right to be upon that Jury. In point of justice, it ought to be so. In fair play it would be so. Yet what was the first step? Eleven Catholics, who were on the reduced list, were struck off by the Attorney-General. They say that they were Repealers. In the first place, that was not true. That is one answer to it. In the next place, if it had been true, it is no reply, because though to be a Repealer may be a great folly, it is not a crime. It is not a crime that makes a man an outlaw, and if they say that Repealers would have been favourable jurors to me, I ask whether the most violent Anti-Repealers—men who voted against me three or four times over—could form a fair and impartial Jury against me? I use their own argument; I convict them out of their own mouths. I appeal to the common sense of Englishmen to say, if Repealers would have been favourable to me, would not Anti-Repealers be favourable to others? But, recollect, it was more important to have an impartial Jury on this trial, as the crime was not a definite one. Had it been murder, or robbery, or forgery, any human intellect could have judged of the nature of the crime, and would only have had to decide on the question of fact; but here the crime was imaginary—one, partaking more of identity than of reality—one, which emphatically required a thoroughly impartial as well as intelligent Jury. From that Jury one Protestant was struck off—an intelligent individual—one of a higher order of intellect than the others; that intelligent Protestant was sent to keep company with the eleven Catholics—and they call that a fair trial. I call that a persecution rather than a prosecution. It was not a fair trial—it was shifting, scheming management. I say I am not convicted by due course of law, and in prison I shall feel that I am a victim—and in that prison I shall have the feeling at heart that will raise me superior to the punishment. Why, I have plenty here to open my prison doors, but it would be very idle to suppose that I am not thoroughly prepared for an event of that kind. But whatever I may suffer for my country, I shall rejoice in my suffering. Whatever may be the inflictions which I may have to undergo, I shall bear them cheerfully for the sake of my country. I denounce the whole of the proceedings against me, and my words will not be confined to these walls. Wherever the English language is spoken—and the sun never sets upon the countries in which that language is spoken—wherever the accents of the English tongue are heard, will these my words be borne upon the wings of the press—and throughout America, France, India, throughout every country in the world, will this my protest go forth against that which I denounce as a dishonest persecution, and my contemptuous defiance of those who have conducted it." Mr. O'Connell then passed to the subject of Repeal, declaring that he wanted only an Irish Parliament for local purposes, and that he desired a more intimate and sounder union rather than separation. He adduced statistical details to prove the failure of the Reform Bill and the wretchedness of the Irish people. He advocated the ballot, an extension of the suffrage, and short Parliaments, and concluded by saying—"I have never shrunk from standing by you in any contest—I have always been at your side—I have never given a vote that was calculated to increase the burdens of the English people. But I have invariably supported every measure that was calculated to increase the extension of civil and religious liberty. I have advocated the cause of the slave in America, as well as the peasant in Ireland. I care not what their creed, or by what sun their face may have been burned. I care not what is a man's caste or what his language, if I can but provide for him liberty from all tyranny. I solemnly assure you that if I was not thoroughly convinced that the establishment of a domestic legislature was essential to the comfort of Ireland, and that it was necessary to keep up the connection between this country and Ireland, I would advocate it no longer. I never wish to see Ireland separated from this country; but to accomplish so excellent a measure it is necessary that something should be done to give to Ireland what England has—a local legislature. Newfoundland, Barbadoes, Jamaica, and all the

English colonies, even Botany Bay, had a domestic legislature—all, except Ireland; and yet no one saw that they were separated. I want for Ireland that the law passed there should be passed upon the same principle as in England. Such was the opinion of the wise and good, and such I hope it ever will be. Let them do justice to Ireland. Let those in both countries who desire to adhere to the law, who desire to have it cheap and intelligible, and to be administered with economy—let those who desire to see the progress of national reform—let them do all in their power to do justice to Ireland. By adopting that course they might be sure they would find in Ireland grateful hearts to assist them, and they would establish a real union—a union more valuable by a domestic legislature, and by a complete combination of a free, happy, and loyal people." Mr. O'Connell sat down amidst great applause, which lasted for several minutes. After the cheering had subsided several other toasts were given from the chair, or proposed by different members of the company. Among them were those of "The People," proposed by the Earl of Shrewsbury, and "The 78 Peers who supported Lord Normanby's motion; and the 227 Members of the House of Commons who supported Lord John Russell's motion." When this toast had been responded to, the chairman said, among many other letters of apology for non-attendance on the part of Peers and Members of Parliament, he might specify two in particular—one from the Earl of Radnor, the other from Lord Kinnaird. He also took occasion to say, that among the majority against Lord Normanby's motion, were the names of Lord Ellenborough, in India; of Lord Saltoun, in China; and of Lord Tweeddale, in Madras—whilst Lord Sidmouth had opposed the just rights of Ireland even from his coffin. Lord Camoys, the Hon. H. F. Berkeley, M.P., Mr. Gisborne, Mr. M. J. O'Connell, Sergeant Murphy, and others subsequently addressed the company in support of the toasts of "Justice to Ireland," "Trial by Jury, without fraud or suspicion of fraud," "The Press of Great Britain and Ireland," and other matters connected with Irish politics. The company separated about midnight.

London and Westminster Bank.—The annual meeting of the shareholders in this bank took place last week, Mr. P. M. Stewart, M.P., in the chair. The report, which was unanimously adopted, stated that the net profits of the past year, after defraying all the current expenses, paying the income-tax, and making provision for all bad and doubtful debts, amounted to 51,696*l.* 5*s.* 7*d.* Out of these profits the directors had paid last September a dividend at the rate of 6 per cent. per annum for the half-year ending the 30th June, and they now declared a dividend at the same rate for the half-year ending the 31st December. After the payment of these dividends, amounting together to 48,000*l.*, there would remain from the profits of the year a surplus of 3696*l.* 5*s.* 7*d.*, which, added to the reserve fund, made the present amount, 66,822*l.* 16*s.* 5*d.*

Victoria Park.—The Ministerial papers state that notwithstanding the anticipations of the inhabitants of the eastern division of the metropolis that the operations for the formation of the park would commence early in the present spring, the Crown has given permission to the market-gardeners to continue in occupation and plant their lands, which were lately purchased, for six months. Within any portion of this time, however, they are to give up possession to the Crown on a fortnight's notice to remove the stock.

University College Dinner.—This annual festival was held at the Freemasons' Tavern on Tuesday week. A large party sat down to dinner, including several Members of Parliament and representatives of the several learned professions who had been educated at the college. Mr. Mitchell, M P., was in the chair. After the usual loyal toasts had been drunk, "Prosperity to University College" was proposed and received with much applause. During the evening several speeches were made by Messrs. Christie, M.P., Monckton Milnes, M.P., Greenhough, Power, G. Y. Lee, Potter, &c.

City Antiquities.—In Friday-street, Cheapside, a short time ago, stood the house occupied by Sir Christopher Wren, during the erection of St. Paul's, and which adjoined the church of St. Matthew, Friday-street. In the course of pulling down the building, which was sold a few weeks since, and is now nearly levelled with the ground, several silver and copper coins were found in the joists of the flooring by the workmen. The silver coins were of the reign of Elizabeth, and the copper coins of an earlier period. The foundation walls are of extraordinary thickness. A portion of them formed part of the Saracen's Head, which is also taken down.—While making excavations for a sewer in Duke-street, Houndsditch, a few days ago, the workmen discovered the foundation of the ancient Roman-wall, which was known to have passed near this spot from the Minories to London-wall. It was found at about eight feet from the surface, and was between four and five feet in width. Many of the houses in Bevis-marks, adjoining Duke-street, are built upon this wall. It was observed that outside the wall, where it abuts upon Houndsditch, there was a depth of made earth of about 14 or 15 feet, showing that the spot had been filled up at some early period, while within the wall the native earth was at a depth of between two and three feet, below which is a bed of sand. At the depth where it is necessary to build the sewer, water is abundant.

Thames Tunnel.—The annual meeting of the proprietors of the Tunnel was held last week. Mr. B. Hawes, M.P. in the chair. The report stated that the tunnel had, as expected at the last annual meeting, been opened on the 25th March, and had since been honoured by a visit from her Majesty, Prince Albert, and many distinguished noblemen, foreigners, and scientific men, all of whom had expressed their admiration of the work. Since the tunnel had been opened for passengers upwards of two millions of persons had passed through it. In the atmosphere of the tunnel there was very little difference from that above. The directors had reduced the expenses, and the total savings contemplated would be about 985*l.* per annum. Upon analysation, it was found that the water now in the tunnel was solely from land-springs, which in Sir I. Brunel's opinion would soon be dried up. The stalls for the sale of fancy goods under the Thames, had realised last year 470*l.*, and on the anniversary of the opening of the tunnel it is intended to have a fancy fair. The tolls received during the year at one penny each passenger amounts to 8478*l.* 2*s.* 8*d.* In a report to the directors made by Sir I. Brunel, dated the 12th ult., he says:—"The tunnel is now viewed by the public with as little idea of danger, and with as little regard to the state of the tide, or any other of the circumstances which formerly were supposed likely to affect it, as any of the bridges are; and the works are in an excellent state." The carriage-way descents, as stated in the last report, are now alone wanting to complete the work as originally intended, but the directors consider it advisable to collect further information respecting the exact cost of forming the carriage-way descents, and also as to the probable returns for an outlay for a carriage approach, supposing the money should be available, in order to enable the proprietors to form a correct judgment as to the expediency of carrying the plan into execution.

Pentonville Prison.—In a return moved for by Mr. T. S. Duncombe, M.P., relative to the new "model prison" at Pentonville, it appears that the total number of prisoners received into the prison since its opening amounts to 537; that 26 convicts have been removed from the prison—viz., 19 for illness and infirmities, 3 for insanity, 3 for incorrigible characters, and one, who was a man of education, and an army agent (convicted of stealing silver spoons from a club to which he belonged), because it was thought that he would not be benefited by learning a trade, has been sent to Van Diemen's Land with other convicts. The number of convicts pardoned on medical grounds amounts to 5; one received a free pardon, independently of medical grounds. The number of deaths has been 2. Thus the total number now confined in the model prison amounts to 503.

Fires.—We stated last week that an attempt was made to set fire to the extensive premises of Messrs. Grissell and Peto, of the York-road, Lambeth, on Friday se'nnight, which fortunately was discovered. Another attempt was made on last Friday night, and near the same spot. The firemen were soon in attendance, and the damage only amounted to about 20*l.* The firm have determined in future to have a night fireman, so as, if possible, to protect their property from the incendiary.

Robbery.—On Thursday last the following robbery was committed in the Drawing-office of the Bank of England:—A gentleman was in the act of paying money to one of the receivers, having previously placed his pocket-book on the counter; while so engaged, some thief contrived to purloin the pocket-book, which contained a Bank of England note for 50*l.*, one for 10*l.*, one for 5*l.*, and 2*l.* 17*s.* 6*d.* in gold and silver, being in all 67*l.* 17*s.* 6*d.*, with the whole of which he got clear off.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending Mar. 2.—West Districts 154; Northern, 194; Central, 218; Eastern, 243; Southern, 246; Total, 1055; Weekly average for the last five years, 946.

Provincial News.

Agricultural Meetings.—The following meetings have been reported since our last. On Friday, at Shap, Westmoreland, Sir Geo. Musgrave, Bart., in the chair, supported by a large number of the landowners and farmers of that county.—On Tuesday, at Faringdon, Mr. Freeman, of East Coxwell, a farmer, in the chair, supported by Mr. Mills Goodlake, Mr. J. J. Allnatt, Lord Barrington, Mr. Pusey, and other agriculturists of Berkshire.—On Friday, the 1st inst. at Aberdeen, Mr. Grant, convener of the county, in the chair, supported by the principal land-owners, farmers, &c., of the district, at which it was agreed to convene another meeting on the 15th.—On Tuesday last, at Reading, Mr. W. Mount, President of the Berkshire Association, in the chair, supported by the members for the town and county, and about 300 magistrates and farmers.—On Thursday, at Ripon, the Mayor in the chair, supported by the principal landowners and agriculturists of the neighbourhood.—At Bridgewater, last week, Mr. Hancock, of Halse, in the chair, supported by Sir A. Hood, Bart., the Mayor of the town, and about 300 landowners and farmers; at which arrangements were made for sending petitions to the Legislature from every parish in Somerset, praying for a continuance of adequate protection to British Agriculture, with the view of expressing the real sentiments of the agriculturists, "in answer to the misrepresentations conveyed to Parliament and the public by the pretended county petition of the Anti-Corn-Law League."—A meeting was held at Lincoln, on Tuesday, the Hon. A. L. Melville in the chair, supported by Earl Brownlow, Sir. J. Trollope, Mr. Christopher, and other landowners, to consider the propriety of forming a county society, but no resolution was come to upon the subject; and, ultimately, it was agreed that the meeting should be adjourned to the Thursday in April fair-week, to give time for the London Society to prepare and publish their plans. Meetings in opposition to the League were held on Wednesday at Morpeth, Mr. Langland in the chair, supported by Sir C. M. Monck, Bart., Hon. H. T. Liddell, M.P., Sir E. Blackett, Bart., and the principal agriculturists of Northumberland. At Ragland on Friday, Mr. Walbridge of Lanthewy in the chair, supported by Sir D. Mackworth, Bart., Mr. Vaughan of Courtfield, Mr. S. Bosanquet, Mr. Fothergill, and numerous other land-owners of Monmouthshire.

Ambleside.—On Thursday, the 7th inst., a commission under the seal of the Bishop of Chester, was held in this town, for the purpose of investigating a charge made against the Rev. W. Sewell, incumbent of Troutbeck, "of drunkenness, intemperance, intoxication, scandal, and other evil report." The commissioners appointed by the Bishop were, the Archdeacon of Manchester, the Rev. G. Park, of Hawkshead, and the Rev. R. P. Graves, of Windermere. The investigation, which was undertaken at the instance of Benson Harrison, Esq., of Greenbank, a magistrate for the county, excited a great deal of interest throughout the Lake district, and the room was densely crowded during the proceedings. Three witnesses were examined on behalf of the prosecution, and nine on the part of the defendant. After duly considering the evidence on both sides, the commission decided that there were no grounds whatever for the charge, and that it was unnecessary to proceed further with the inquiry.

Bradford.—On Saturday last, the boiler in Mason's Mill in this town, suddenly exploded while the hands were assembling for their morning work. The end of the building was torn down by the explosion, four children were killed, and several others severely injured.

Birmingham.—Rather an unusual circumstance in connexion with the bankruptcy case of Mr. Smallwood, the banker, was elicited at the audit meeting in the Birmingham Court, on Friday last. It appears that after paying all the creditors who have proved the full amount of their claims (20*s.* in the pound), the residue was handed over to the bankrupt.

Brighton.—Capt. Pechell, M.P. for this town, has addressed the following letter to the High-Constable, in reference to a statement in the *Times* that the Pavilion was likely to be sold:—"Dear Sir,—My attention having been drawn to a paragraph in the *Times* newspaper, stating 'That in consequence of a residence in the Isle of Wight having been engaged for her Majesty, during her excursions in the Royal yacht, a bill would be brought into Parliament to enable the Government to dispose of the Pavilion at Brighton,' I am happy to inform you that, having made the necessary inquiries, I am enabled to say there is no truth whatever in the statement as regards the Royal residence in your town.—I am, &c., S. R. PECHELL." On Wednesday night, Mr. Solomon, Chief Officer of Police in this town, was murdered by a prisoner who had been brought to the office on a charge of felony. The prisoner it appears is called John Lawrence, and is of a respectable family at Tunbridge Wells, and the son-in-law of a farmer at Speldhurst. He had contracted low habits and had been given into custody for stealing a piece of carpet from a draper in St. James's-street, when he struck the chief-officer on the head with a poker. Mr. Solomon lingered till Thursday, when he expired. The prisoner has been committed for trial.

Cambridge.—A meeting was held in this town a few days since, to hear Dr. Candlish advocate the cause of the Free Church of Scotland. Considerable opposition was shown to the object of the meeting, and the demonstration proved a failure.

Devonport.—On Saturday morning the brig Theresa, of this place, which was discharging coals at the wharf near the Arsenal, took fire, and was so much injured as to be past repair, the vessel having been injudiciously scuttled at low water, so that the water from the engines ran out as soon as it reached the hold. A lad was burned to death in the steerage, and another—the son of Mr. Phillips, of Newport, formerly collector of customs in Cornwall—was so much injured that he died in a few hours.

Manchester.—Considerable interest has been created in the commercial circles by the sudden distraint made upon the Messrs. Fielden for about 300*l.* income-tax, alleged to be due from the firm. It appears that Messrs. Fielden returned their income-tax papers "nil;" but the commissioners not being satisfied with the return, assessed them in about 300*l.* The hon. member for Oldham, as the senior partner of the concern, appealed against the decision of the commissioners, and upon oath at Rochdale confirmed the correctness of the return. He was then told that the matter should be further considered, and that when he was wanted again he would be sent for. There the matter rested till last week, when, to the astonishment of his brothers, sheriff's officers walked into their works at Todmorden, and took possession of the whole premises. This proceeding created considerable excitement in Todmorden, and might have been the cause of serious consequences. Messrs. Fieldens are so respected by their own workmen and their neighbours generally, that had the officers persisted in their determination to retain possession, even their influence might not have been sufficient to protect them. Finding the feeling that prevailed in Todmorden, the officers gave up possession and came straight off to Manchester, and took possession of the warehouse. Immediately on their appearance Mr. T. Fielden gave orders that no more business should be transacted until the affair was settled, and with a view of carrying out these orders refused to allow any goods to pass either in or out of the premises. Mr. Fielden adhered to his previous resolution, and was determined not to pay the tax; and the officers, by orders of the commissioners, issued an advertisement in the local papers, and on Monday last sold a large quantity of goods sufficient to make up the amount of the assessment.

Oxford.—The attention of the authorities of the University has been directed recently to certain irregularities in the conduct of some of the junior members; and two

cautionary papers have issued from the Board of Heads of Houses and Proctors—one on the subject of dining and supping at inns, and at the houses of confectioners; the other, on the damage done to the farmers in the neighbourhood by "drag hunting;" and the undergraduates are reminded that both the abovenamed practices are contrary to the statutes, and subject the offenders to punishment.—The Vice-Chancellor has prohibited any meeting in favour of the Free Church of Scotland in any building in Oxford to which the students have access.

Wrotham.—Several incendiary fires have taken place in different parts of Essex during the last fortnight. Among others, one broke out at Falkbourn-hall, the seat of J. Bullock, Esq., in the night of Friday last, by which the whole of the stables and coach-houses, an extensive pile of buildings, were burnt to the ground. The fire was confined to these buildings; neither the mansion nor any of the other out-buildings sustained injury. The fire originated in the harness-room, and the whole of the stable-apparatus was entirely destroyed. The carriages were also much injured, and two of the horses were burnt to death, it being impossible to remove them in time.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1193*l.*; Birmingham and Gloucester, 1735*l.*; Eastern Counties, 3185*l.*; Edinburgh and Glasgow, 1795*l.*; Great Western, 11,320*l.*; Grand Junction, 6911*l.*; Glasgow, Paisley, and Ayr, 1979*l.*; Great North of England, 1166*l.*; London and Birmingham, 12,770*l.*; South Western, 1827*l.*; Blackwall, 598*l.*; Greenwich, 693*l.*; Brighton, 2382*l.*; Croydon, 200*l.*; Liverpool and Manchester, 3795*l.*; Manchester, Leeds, and Hull, associated, 5267*l.*; Midland Counties, 2217*l.*; Manchester and Birmingham, 2021*l.*; North Midland, 3762*l.*; Newcastle and Carlisle, 1294*l.*; South Eastern and Dover, 2436*l.*; Sheffield and Manchester, 468*l.*; York and North Midland, 1339*l.*—The half-yearly meeting of the London and Croydon Company was held last week. The report announced that the branch line to the Bricklayers' Arms would be opened by the 1st of May, when the fares upon the main line would be reduced, the traffic upon which was in a stationary state. With respect to the question of toll with the Greenwich Company, no definite conclusion had been arrived at, and the directors suggested that any further negotiations must be deferred until the Greenwich Company has fully ascertained the results of the policy they had hitherto pursued. The directors, for a variety of reasons, had declined to entertain the proposition of the South Eastern and Dover Company to lease the Croydon line. The Brighton Company, since the last meeting, had agreed to join the establishment at New Cross, for the amalgamation of the locomotive power of the companies, the arrangement for which commenced on the 1st of this month. A Bill for the extension of the Croydon line to Epsom was now before Parliament, and the directors had felt it their duty to promote the formation of a proposed line to Chatham, by a junction with the Croydon Railway at Norwood, thus opening a communication with the metropolis and Rochester, Gravesend, Brighton, Portsmouth, &c. The directors observed with satisfaction the appointment of a Parliamentary Committee, and thought that both the policy and position of the Croydon Railway had everything to hope from it and nothing to fear. The balance for the half-year was 14,655*l.*, out of which a dividend was declared of 7*s.* per share. A long discussion took place on the topics contained in the report, which was carried unanimously.—The half-yearly meeting of the West London Company was held last week. The report announced that the whole of the line was completed, and only wanted the necessary proofs of testing its solidity before its opening to the public on the 15th May next. Satisfactory results had been obtained in the recent negotiations with the London and Birmingham and Great Western Companies. The directors, with a view to the business arrangements of the line, had appointed Mr. S. Braithwaite, the late manager of the traffic department on the Eastern Counties Railway, to superintend it. The report having been received, resolutions were passed authorising the directors to raise a further capital of 129,200*l.* for the extension of the line to Knightsbridge, and also the remaining sum of 12,800*l.* authorised to be raised under the Company's amended Act. Great part of the 129,000*l.* will be expended in purchasing the land across which the branch line is to run. The directors calculate, however, that not half that sum will be actually wanted, and therefore one of the resolutions embodied a plan for expending the surplus, if any, in cancelling the shares created by the new arrangement.—The thirteenth half-yearly meeting of the Manchester and Birmingham Company was held last week, at which a dividend of 18*s.* per share was declared, leaving a balance in hand of 4858*l.* 3*s.* 1*d.* The satisfactory state of the Company's affairs immediately caused the shares to advance to 4*l.* premium.

IRELAND.

Dublin.—The weekly meeting of the Repeal Association was held on Monday, Mr. De Verdon, of Dundalk, in the chair. Mr. John O'Connell said he had received a letter from his father, describing the reception he had received in Birmingham. He was sure it would prove gratifying to the Irish people to hear of the enthusiasm which greeted Mr. O'Connell on every occasion in which he came before an English audience. Mr. Smith O'Brien moved that Mr. O'Connell's letter be inserted on the minutes, which was carried. Mr. R. D. Browne, Mr. S. O'Brien, and others, then addressed the Association at considerable length. Mr. J. O'Connell, in reference to a statement in a letter inclosing rent, said it was necessary to repeat that the Association could not in future transmit newspapers, or have any connection whatever in the circulation of them. They were determined to respect even the semblance of law. He further observed, that the "Instructions to Repeal Wardens" had been made the subject of much cavil in the recent State Trials, and had been used against them. He then mentioned that new instructions were in course of preparation, and he moved a resolution to the effect that the existing instructions be suspended, and that all Repeal Wardens should cease to act on them; but that, nevertheless, those Wardens should continue in their praiseworthy efforts to preserve the peace, to obtain signatures to petitions, and to apprehend Ribbonmen. Mr. Steele, as head Repeal Warden, earnestly called on his brother Wardens to act in accordance with the advice of Mr. J. O'Connell. The rent for the week was 305*l.* 4*s.* 4*d.*

Belfast.—A special meeting of the Irish General Assembly was held last week to consider the recent decision of the House of Lords in the Presbyterian Marriage case. The moderator, the Rev. Dr. Stewart, presided, and arrangements were completed for meetings to be held all through the country to petition Parliament. This agitation, it is said, will assume a very formidable character.

Law.

ASSIZE INTELLIGENCE.—NORFOLK CIRCUIT, AYLESBURY.—The Rev. *John Day* was indicted for having feloniously and maliciously wounded seven sheep, the property of one William Weedon, on 19th July last. This singular case excited very general interest in the neighbourhood of Aylesbury, and the Court was thronged to hear the details of the trial. The prisoner is rector of the parish of Hawridge, near Aylesbury, and at the time to which the evidence related he lodged in the house of a farmer named Glenister. Mr. Glenister held some land as tenant to the prisoner, and adjoining that land was a pasture belonging to Mr. Weedon, the prosecutor. On the 19th of last July the prisoner and Mr. Weedon met in the high road at Hawridge, and the prisoner told Mr. Weedon that seven of his sheep had been trespassing in his close, and he had impounded them. Weedon replied it was all nonsense, for that the fences over which they had strayed—if they had trespassed at all—were Mr. Day's, and he alone was in fault. The prisoner upon this said, "Then I'll go and prosecute the sheep;" and he and Weedon parted. It appeared that the prisoner went directly to his stable in which the seven sheep were impounded, and having called one of Glenister's labourers, desired him to hold them while he hamstrung them. He took out his knife, and having driven the poor animals into a corner in the stable, he stabbed them all in the right flank to the depth of about six inches; after which he turned them out of the stable, and drove them in the direction of their own pasture. It happened that at this time Mr. Weedon was going by, and seeing his sheep bleeding and lame, and in a most pitiable condition, he accused the prisoner of having cut them, an accusation which the latter denied, telling the prosecutor he was a liar, for none of the sheep had been on his premises. The prosecutor replied that it was plain how the matter stood; to which the prisoner rejoined, there was no great deal of harm done after all, and the parties then separated. Mr. Weedon then procured the attendance of a couple of butchers, who examined the sheep, and certified that the damage done was 4*l.*; this was reported to the prisoner, who refused to pay that sum, but offered 2*l.*, and said he hoped he had not injured them any great deal. They were, however, very severely injured; and on the following day the butchers recommended their owner to have them put out of their misery, and it was done. The prosecutor after this took no steps to bring the prisoner to justice, and would not have taken any notice of the matter, had not a neighbouring justice told him it ought to be followed up, and that prosecutor, as the constable of the parish, ought of all men to be aware how wrong it was to let so serious a matter pass. He therefore laid an information, and the prisoner was apprehended and committed to prison. In his cross-examination the prosecutor said there was no ill-feeling betwixt him and the prisoner, but that on the contrary he had been bail for the latter upon some other charge at the sessions. The defence set up was, that the prisoner had no malice or grudge against Mr. Weedon, and that therefore he could not have done the act in question from any wish or desire to injure him by destroying his property; and that the real truth was, that the prisoner thought that he had a right to kill or wound the animals which had committed the trespass in respect of which they were impounded. If he sincerely believed this, he was entitled to an acquittal, as such belief negatived all notion of malice on his part, which was a necessary ingredient in the evidence for the prosecution in support of such an indictment. The Jury took this view of the case, and Acquitted the prisoner. Lord Abinger, addressing the prisoner, advised him to be very circumspect in future, and endeavour to govern his temper. It was really lamentable to see such an ignorance of the first rules and principles of law in a man occupying the station and filling the office which the prisoner occupied and filled; and he seriously advised him to profit by the grace and the mercy which had been shown to him, by applying some portion of his time in acquiring a knowledge of the laws of his country and the rights of his neighbour. The prisoner was then discharged.

OXFORD CIRCUIT, WORCESTER.—*Reg.* v. *the Rev. William Smith.*—The defendant, who is the vicar of the parish of St. Faith Overburry, some time since dismissed the prosecutor, Thomas Harris, from the office of parish Clerk, which he had held for several years. The prosecutor obtained a mandamus in the Court of Queen's Bench, calling on defendant to restore him to that office, the return to which alleged as the grounds of dismissal, several acts of gross misconduct on the part of the prosecutor. To this return there were two pleas; first that prosecutor had not been summoned or heard in his defence prior to his dismissal, to which plea there was a demurrer; and secondly, a traverse of the various acts of misconduct alleged on the return; on this plea, issue was joined. The Court of Queen's Bench had given judgment in the prosecutor's favour on the issue in law, and the issue of fact now came on for trial. Several witnesses were called who had been in the constant habit of attending the church in Overbury, and who clearly proved that on St. Andrew's day, 1841, and Ash Wednesday, 1842, the prosecutor was intoxicated in the church; that on the former day he could not find the proper place in his book, and that it was found for him by one of the congregation; that he read in an irregular and incorrect manner, sometimes before and sometimes after the vicar; and that his conduct and reading annoyed the congregation, and made several laugh. Before the visitation in August, 1842, the vicar having introduced chanting, desired the clerk to read the responses in a lower tone of voice; but he ceased reading them altogether, until the second Sunday after the visitation at which the charges were made against defendant; and on that Sunday he began to read them in a loud and harsh voice, and most irregular and brawling manner, which several witnesses declared was very annoying to the vicar and congregation. At the evening service, on Ash Wednesday, 1842, defendant went to the communion rails to change his surplice, and the prosecutor, holding up the gown in his hands, endeavoured to force it over the surplice. His conduct on that evening was described to be precisely that of a drunken man. Two or three witnesses proved that at the evening service, in Dec., 1842, prosecutor endeavouring to snuff his candles, extinguished one of them, and this awkwardness witness thought at the time was caused by drink. The prosecutor's violence on receipt of the notices, and his insolent language respecting the vicar, were fully proved. It was shown by the testimony of some of those who were present for the purpose of receiving the sacrament at Michaelmas, 1842, that the vicar, seeing the prosecutor in the church, sent Mrs. Smith to him thrice. The witnesses did not hear what she said to him; he waited a few minutes and left the church. He soon after re-entered, the service not having yet commenced. Mrs. Smith was sent to him again, when he exclaimed that he was ordered by Mr. Price the churchwarden to do his duty, and he should do it, and read aloud. The vicar then said that those who wished to receive the sacrament should draw near, and that those who did not were to withdraw. The prosecutor then went away. The service was interrupted for about a quarter of an hour. Several other acts of an indecorous and improper character, both in church while acting as clerk, and out of church when any messages or notices were sent to him by defendant, were proved. Several witnesses were called by prosecutor's counsel, but though they stated that in their opinion the prosecutor read well, yet they admitted that his voice was loud and discordant, and heard above the chanting of the congregation. They also confirmed the evidence given by the defence respecting the intoxication of the prosecutor. Mr. Justice Coleridge, in summing up, said that he should leave three points to the Jury for their consideration:—first, whether they were satisfied that the prosecutor had been intoxicated as alleged? secondly, whether he had read in a loud and harsh voice to annoy the vicar? and, lastly, whether he had obstructed the administration of the sacrament? The Jury after a short deliberation found for the defendant on the first two points, and for the Crown on the third. The verdict was then entered generally for the defendant. This case occupied the Court 11 hours.

NORTHERN CIRCUIT, DURHAM.—*Topham and Wife* v. *Macgregor and Wife.*—This case, which commenced on Thursday morning at nine o'clock, was an issue directed from the Court of Chancery, to try the validity of a will made by the late Richard Wrightson, of Cockerton, near Darlington, under date of December 29, 1829, bequeathing certain copyhold premises within the manor of Bondgate to his then wife, one of the present plaintiffs. The plaintiffs said that the testator did thereby devise the same; defendant asserted that he did not, and thereupon issue was joined. The case was gone into at great length. The facts are briefly, that Wrightson bequeathed, by the will alluded to, all he possessed to his wife, Mrs. Wrightson, who afterwards married the plaintiff, Topham; Wrightson's sister was the wife of Macgregor; nothing was bequeathed to them; and they disputed the validity of the will on various grounds, one of which was, that the execution of the will was informal, the attesting witnesses signing it before it was a will—being merely then blank; another, that when he made it he was of unsound mind; and, third, that the making of the will was the result of a conspiracy between Topham, his wife, and Mr. Mewburn, their law agent. The plaintiffs repudiated these allegations, and counsel entered into lengthened statements, read various letters, and called a number of witnesses to establish this disclaimer. Baron Rolfe having summed up with great minuteness, occupying nearly three hours, the Jury, after retiring for a short time, returned a verdict for the plaintiffs. The case occupied three days.

MIDLAND CIRCUIT, NORTHAMPTON.—*Nathalie Nuard*, aged 27, was charged with having, in April last, at Barnock in this county, feloniously delivered to the Rev. Herbert Charles Marsh certain letters, demanding 10,000 francs, being of the value of 400*l.* in English money. The prisoner was a Frenchwoman, and it was stated she knew hardly a word of English. The Rev. Mr. Marsh the prosecutor is about 36 years of age, and son to the late Bishop of Peterborough. He is Rector of Barnock and Prebendary of the Cathedral of Peterborough, but since the facts of this case have been known to the present Bishop, the services of his Church have been performed by a Curate. The facts of the case are briefly these:—Mr. Marsh is an unmarried man, and a few years ago became acquainted with the prisoner at a disreputable house in London. This led to frequent communication between them in London and Paris, which ended in her annoying him, and thus led to the present prosecution. The Jury after a long consultation returned a verdict of Not Guilty, which was received with applause by a crowded Court. This demonstration of feeling was instantly checked. There was a second indictment, but the Counsel for the prosecution said it was substantially the same question, and therefore no evidence would be offered; the prisoner was therefore acquitted on the second indictment. There was a third charge, that of conspiring to extort money, which was not pressed, upon her entering into her own recognizances to come up when called upon, and in the meantime to keep the peace.

BIRTHS.—On the 5th inst., at Baden Baden, the lady of W. H. DOUGLAS, Esq., barrister-at-law, of a daughter—5th inst., at Beddington, Surrey, Mrs. G. ENGSTROM, of a son, which survived its birth only a short time—7th inst., at Stretton, Wolverhampton, the lady of Lieutenant-General MONCKTON, of a son and heir—9th inst., at the Vicarage, Stanwell, the wife of the Rev. W. W. BERRY, of a son—9th inst., at Ebley, Gloucestershire, the lady of P. LEVERSAGE, Esq., of a daughter, still-born—9th inst., Mrs. J. R. UNWIN, Alfred-place, Brixton, of a daughter—9th inst., in Upper Stamford-street, Mrs. J. MATTHEWS, of a daughter—10th inst., at Hornsey, Mrs. M. SPARTALI, of a daughter—11th inst., at Priory-place, Edgbaston, near Birmingham, the lady of A. J. L. PEEBLES, Esq., 59th Reg., of a son.

MARRIED.—On the 6th inst., at Monkstown, near Dublin, M. W. NIBLETT, eldest son of Mr. G. Niblett, of Bow, Middx., to MARY, widow of the late Mr. J. Kertland, of Sackville-street, Dublin—7th inst., at the parish church, Wolverhampton, S. BOURNE, Esq., of her Majesty's Customs, Jamaica, to CHARLOTTE MARY, eldest daughter of the late J. S. Sparrow, Esq., of Oxley, Staffordshire—8th inst., at Tonbridge chapel, London, the Rev. T. W. HINDS, of Essex, to JANE, eldest daughter of the late R. Johnson, Esq., of Fleetholme-house, St. Bees, Cumberland—9th inst., at St. George's, Hanover-square, J. STORY, Esq., of Mile-end, to HARRIOT DOCKER, niece of J. Somes, Esq., of New Grove, Mile-end.

DIED.—On the 9th Jan., near Hawulbaugh, by the accidental discharge of his gun, whilst out shooting, Lieut. B. S. COOPER, 44th Bengal Native Infantry, second son of B. B. Cooper, Esq., of New-street, Spring Gardens, aged 21—28th Jan., at his residence, Esplanade, Bombay, Capt. G. SIMPSON, of the Hon. East India Company's Service, I.N., from the effects of a fall from his horse—1st inst., at Anglesey Hunt, J. M. WAUGH, Esq., Commander, R.N.—6th inst., of rapid decline, at Killarney, PATRICK O'CONNOR, Esq., for some years past connected with the *Morning Advertiser* as a Parliamentary reporter, aged 28—8th inst., T. HOWARD, Esq., of Romford, Essex, aged 80—10th inst., at Holly-cottage, Cheltenham, MARY, relict of the late H. Heyman, Esq., of Dancer's-hill, Middlesex—10th inst., at 15, Pittville Villas, Cheltenham, Major G. H. HUTCHINS, late of the Bengal Army—10th inst., at Frog-house, near Monmouth, after a short illness, HELEN MONTAGU WYATT, third daughter of the late A. Wyatt, Esq.—12th inst., at Brentwood, Essex, CAROLINE MANN, widow of the late Rev. C. R. Landon, of Richmond, Surrey, and rector of Vange, Essex—12th inst., at 44, Bedford-square, of inflammation of the lungs, ELIZABETH MIRIAM, the beloved daughter of Phineas Nathan, Esq., aged 22—12th inst., in Grosvenor-place, T. S. HORNER, of Mells-park—12th inst., at Higham-hill, Walthamstow, the infant son of J. B. CAPEL, Esq.—10th inst., at Broxbourne, Herts, P. E. OTTEY, Esq., formerly of the Navy Office, and a magistrate for the county of Middlesex, aged 87—12th inst., after a long illness, CECILIA, the sixth daughter of the late Sir Bethel Codrington, Bart., of Dodington, Gloucestershire—1st Jan., at Camp Danaila, Major G. R. CROMMELIN, C.B., 1st Regiment of Native Infantry. His death was occasioned by a severe gun-shot wound received when heading his regiment at the battle of Maharajpore, 29th Dec., 1843—10th inst., at the residence of her father, the Rev. E. Jermyn, of Carlton-rectory, near Lowestoft, SARAH THEOPHILA, wife of the Rev. J. A. Ashley, of Woodhall, Hilgay—Saturday last, at his residence in Curzon-street, Sir HENRY HALFORD, physician in ordinary to her Majesty, &c. &c. &c—12th inst., after a long illness, CLAUDE MIDDLETON, the beloved son of William and Mary Howitt, a boy of extraordinary promise.

SUPERIOR SUBSTITUTE FOR TARPAULIN, &c.

C. MACINTOSH & Co., having made a considerable reduction in the price of the Patent India Rubber Covers for Carts, Waggons, Ricks, &c., beg to call the attention of Users of Tarpaulin and Oiled Sheets to the superiority of their manufacture as an effectual protection against wet, not liable to crack on being folded, and more economical than any other Waterproof Cover.—22, York-street, Manchester; and 46, Cheapside, London.

GREAT ECONOMY.—Much time and a great deal of labour will be saved by the use of the SUSSEX CHURN. ATTWOOD, WIMBLE, and WARNER, Manufacturers, Lewes. This Churn being made entirely of block tin, the necessary degree of temperature can be given to the cream, by placing it in a pan of cold or hot water, which ensures the butter coming in 10 or 12 minutes at all seasons of the year. The simplicity of its construction, and the facility with which it may be cleaned, are no inconsiderable advantages over those now in common use.

Sizes.	Nos. 00.	0.	1.	2.	3.
Churn	2½ lbs.	4 lbs.	7 lbs.	14 lbs.	28 lbs. of butter.
Price with pans complete,	18s.	20s.	25s.	33s.	40s.

Delivered, carriage paid, to any part of London.

London Agents.—BENHAM, 19, Wigmore-street, Cavendish-square; LIVERMORE, 30, Oxford-street; BAILY, 71, Gracechurch-street; WRIGHT'S Range Warehouse, near the Monument.

Export Agent.—BARNES & Co., 109, Fenchurch-street.

N.B.—To be seen at the Polytechnic, and Adelaide Gallery.

Observe.—The Improved Water Pail, 4s. and 5s. each.

MOST IMPORTANT TO FARMERS AND GRAZIERS.

GIBBONS' DISINFECTING OINTMENT, a most effectual and perfect cure for Epidemic and Foot-rot in Sheep; also for Epidemic and Foul in Cows' Feet, and for the Grease and Thrush in Horses; prepared only by HENRY GIBBONS, Agricultural Chemist, Wolverhampton.

This Ointment effectually destroys the American grub on Fruit-trees. Sold by all respectable Druggists in Town and Country, in packets at 2s. 6d. each. Mr. William Bailey, Manufacturing Chemist, North Street, Wolverhampton, is appointed Sole Wholesale and Shipping Agent.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

THE following Articles, manufactured in Slate for Horticultural purposes, may be seen in use at Worton Cottage, upon application to the gardener (Sundays excepted).

Tank Covers	Bottoms for Frames
Cisterns	Boxes for Balconies and Verandahs
Shelves	Orange Tubs, Flower Boxes, &c.
Garden Edging	

EDWARD BECK will be happy to answer any inquiries, either personally or by post.

1 Fish-slice				3	10	0
12 Tea Spoons	14	8	0..	5	12	0
1 pair Sugar-tongs				1	5	0

Messrs. SAVORY and SONS recommend the Prince Albert's Pattern; it is very novel, and of unexampled beauty.

METCALFE'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most effectual and extraordinary manner, and is famous for the hairs not coming loose—1*s.* An improved Clothes Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh Brushes, of improved graduated and powerful friction. Velvet Brushes, which act in the most surprising and successful manner. The Genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE'S Sole Establishment, 130*s*, Oxford-street, one door from Holles-street.

Caution—Beware of the words "From Metcalfe's," adopted by some houses.

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the Public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the Apparatus; and B. and H. can safely recommend it from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices, to 130, Fleet-street.

A SINGLE BOTTLE OF BETTS'S PATENT BRANDY may now be obtained in a perfectly genuine state. This convenient arrangement for both vendor and purchaser, and their mutual security against deception, is effected by the use of BETTS'S PATENT METALLIC CAPSULE, made of pure and SOLID METAL, (not Tin Foil) which completely encloses the cork and mouth of the bottle, and is embossed with the words "BETTS'S PATENT BRANDY, 7, SMITHFIELD BARS," the *fac-simile* of which is engraved on a label affixed to each bottle.

In the present day it is impossible to produce anything new and useful without exciting the cupidity of imitators. Already attempts are made to mystify the identity of the original and genuine article, by foisting upon the public the contents of bottles having a Tin Foil covering, falsely denominated "a neat metallic capsule." J. T. BETTS & Co. therefore deem it essential to impress upon purchasers the absolute necessity of comparing the embossed Capsules with the Labels, as an infallible mode of detecting fraudulent substitutions.

BETTS'S PATENT BRANDY, thus protected, may be obtained of the undermentioned Wine and Spirit Merchants, at 3*s.* 6*d.* per Bottle, Bottles included; or at 18*s.* per Gallon, as heretofore, at

Bishopsgate Street	W. Stevens, Nos. 78 and 80.
Bayswater	Charles Simpson, 22, Bayswater Terrace.
Blackfriars Road	S. Silcock, No. 1.
Brixton	S. Hawks, Brixton Washway.

Upwards of 1000 London Policemen's Capes, 2*s.* and 2*s.* 6*d.* each, for Labourers, Gardeners, and Farm-servants. Flags, Banners, &c.

TO FARMERS.—Sheep Net nearly 4 feet high, 4½*d.* per yard, of strong cord; Rick Cloths dressed with a pliable composition of Tar and boiled Oil, which never mildew or are touched by vermin, as follows:—for 30 tons of Hay, 30 feet by 30 feet, 5*l.*; 40 tons, 36 feet by 30 feet, 6*l.* 10*s.*; 50 tons, 36 feet by 36 feet, 7*l.* 10*s.* complete with side-lines. Early orders are respectfully solicited for these Rick-cloths, to prevent disappointment. Dressed Wagon and Hay Cart Cloths. Expanding Tents (the only maker) for Lawns, &c., 35 feet round, 6 feet high in the lowest part, 5*l.*; 42 feet round, 6*l.* 10*s.*; 24 feet round, 4*l.*, put up or down in a few minutes, and require no side-lines. Fishing-Nets of all kinds. Nets to cover in Pheasants, Poultry, &c. 2*d.* per yard. Nets made to order. ROBERT RICHARDSON, Net, Tent, and Rick Cloth Maker, 21, Tonbridge-place, New-road, corner of Judd-street, London.

WANTED, as an Apprentice to a Miller, a young Man of good morals: he will be treated as one of the family. A Premium will be expected.—For Particulars, apply to Mr. STURGES, Henry-street, Bath.

WANTED, as FOREMAN of the Houses, and Propagator, a Young Man, who thoroughly understands the various branches of In-door Culture, and who can produce ample testimonials thereof, as well as for unimpeachable moral conduct. Habits of order and neatness are indispensable. For further particulars, apply to Mr. F. C. BALL, Nurseryman, Taunton.

WANTED IMMEDIATELY, in the Great Yarmouth Nursery, a steady, sober, active Man, who is capable of assisting in the Carnation and Picotee department; can write a good hand, and can also be trusted in the Greenhouse department occasionally. Apply, with terms and reference as to capability, to YOUELL and Co., Great Yarmouth Nursery.—March 14.

WANTED, in a small regular Family, a young Man, who can take the entire management of a Garden, wait at table, clean plate, and is willing to make himself generally useful. A twelvemonths' character from his last place required.—Apply to Messrs. HODGSON, Library, 9, Great Marylebone-street.

WANT PLACES.—All Letters to be post-paid.

AS HEAD GARDENER.—A respectable middle-aged Man, who can give satisfactory reasons for leaving his situation, and whose present employer, as well as numerous gentlemen to whom he is well known as a very successful grower of Pines, Grapes, Orchidaceæ, &c., would be ready to give him testimonials of first-rate abilities as a general Horticulturist and Gardener.—Direct to R. P., at WHITE & Co.'s Nursery, Poole.

Poole, March 12, 1844.

AS HEAD GARDENER.—A single Man aged 27, who perfectly understands Gardening, and can have a good character from the gentleman he has lived with.—Direct to W. Moore, Caen Wood, Hampstead, Middlesex.

TO NOBLEMEN AND GENTLEMEN.

AS HEAD GARDENER.—A middle-aged married Man, who has a thorough practical knowledge of Gardening, having lived in first-rate situations. Can be well recommended.—Direct to the Secretary, Regent's Park Gardeners' Mutual Instruction Society, 61, High-street, Marylebone.

AS HEAD GARDENER.—A single Man, aged 26, who has a practical knowledge of his business in all its branches, is well acquainted with the management of Pines, Vines, and early Forcing, as well as Stove and Greenhouse Plants. Unexceptionable reference will be given.—Direct to W. S., Baynard's Park, Guildford, Surrey.

TO NURSERYMEN.

AS FOREMAN, either in Town or Country.—A steady, respectable Man, who is a good plantsman, and well understands Propagation and Cultivation of Orchidaceæ, Camellias, Heaths, Stove, Greenhouse, Herbaceous, and Florists' Plants, as practised in the London Nurseries. Writes a good hand, could wait on visitors, and attend to orders.—Direct to A. B., at Messrs. NOBLE'S, Seedsmen, 152, Fleet-street.

AS GARDENER, or GARDENER and BAILIFF, a middle-aged married Man, without encumbrance, having held both situations in the same Family for nearly 12 years; his character will bear the strictest investigation, and he will be highly recommended by the Lady whom he has had the honour to serve.—Direct to A. B., at Mr. BROWNLEES'S Nursery, Hemel-Hempstead, Herts.

AS GARDENER.—A young Man, aged 27, who perfectly understands Forcing in all its branches; Kitchen Gardening, and the Cultivation of all kinds of Plants.—Direct to A. B., Calverly Nursery, Tunbridge Wells.

AS GARDENER.—An active and experienced married man, 36 years of age, who has lived 12 years in his last situation as principal; thoroughly understands Pines, Grapes, Flowers, Hothouse and Greenhouse; can have a character from his late employer, and testimonials, if required, from gentlemen who resided in the neighbourhood.—Direct to J. M., at Mr SMITH'S, Florist to Her Majesty, Elizabeth-street South, Pimlico

AS GARDENER, where one or more men are kept.—A married Man, without encumbrance, aged 39, who thoroughly understands his business. Can have 8½ years' character and be strongly recommended by the family he is about to leave, in consequence of the breaking up of the establishment. Wages 22*s.* weekly.—Direct to R. H., Post-office, Marsh-street, Walthamstow, Essex.

AS GARDENER.—A married Man, aged 32, who thoroughly understands his business, and has a thorough knowledge of Pines and Grape-growing. Can have an unexceptionable character from the Gentleman he last lived with.—Direct to B. D., at Mr. STONE'S, Broomfield Gardens, Deptford, Kent.

AS GARDENER.—A steady respectable married Man, aged 38, who perfectly understands his Business in all its various Branches; has a general knowledge of Cattle and Meadow-land, if required. No objection to take a single-handed place. Wages not so much an object as a comfortable situation. Can have a good character from his last place. Direct to A. B., Mr. FINCHER'S, Baker, Wood-place, Shepherd's Bush.

AS GARDENER.—A Married Man, aged 25, who perfectly understands the business, and can have a good character from the Gentleman he is about leaving, where he has lived upwards of three years. Direct A. B., Paper-Mills Nursery Garden, Newmarket-road, Cambridge.

AS GARDENER.—A married Man, aged 38, without encumbrance, who thoroughly understands his business, with Land and Stock, if required. Can have five years' character and be strongly recommended by the Gentleman he has just left.—Direct to B.C., 24, Sackville-street, Piccadilly.

AS GARDENER.—A steady, active, single Man, aged 30, who has a good practical knowledge of the general routine of Forcing, Kitchen and Flower Gardening, &c.; is well acquainted with Stove and Greenhouse plants, and their proper management; also with the laying out and planting of Flower-gardens and Shrubberies, &c. in the most approved style. No objection to any part of the country, or to go abroad. Can have an unexceptionable character from his late employer.—Direct to P. S., 46, Cochrane Terrace, Portland Town, London.

AS UNDER GARDENER in a Gentleman's Establishment, a respectable steady Young Man, aged 23; no objection to either Flower or Kitchen Garden. Direct, stating wages, I. D., 6, Spur-street, Leicester-square.

TO NOBLEMEN AND GENTLEMEN.

A Young Man aged 38 years, who is an experienced Horticulturist, and well acquainted with the various branches of Forcing, the Propagation and Cultivation of Plants, the latest Horticultural Improvements, with Landscape, and Planting to any extent; with care of timber and the general management of a demesne, would be happy to engage with any Nobleman or Gentleman. He has been accustomed to an active situation, and would have no objection to a respectable engagement in any of the islands, or to go abroad: understands Agriculture. The most respectable references could be produced. The Advertiser is a native of N. B.—Direct to H. A., at the *Gardeners' Chronicle and Agricultural Gazette* Office.

TO LANDED PROPRIETORS AND AGRICULTURISTS.

AS LAND STEWARD.—A person, 30 years of age, who has been constantly engaged as a Land Agent, and is thoroughly conversant in all matters connected with the management and improvement of Estates, Draining, Planting, Road-making, Building, Repairs, Letting Farms, Valuations, Tithe Commutation, and also with the most approved systems of Norfolk and Suffolk Farming, Grazing, &c., wishes to obtain a situation as Land Steward to a Nobleman or Gentleman. He can give the most unexceptionable references from Gentlemen to whom he has been known from his infancy.—Direct to C. D., Post-Office, Bury St. Edmunds.

TO LANDOWNERS, &c.

AS STEWARD, MANAGER, OR BAILIFF, or other Agricultural occupation.—An experienced and well-educated North-Country Farmer wishes to engage as above. Unexceptionable References can be given. For further particulars apply to Mr. Stamper, 140, Leadenhall-street, London.

AS FARMING BAILIFF.—A married Man without encumbrance, who has had practical experience both in the north and south of England. Can have a good character from his last place, and his wife also, for the Management of the Dairy and Poultry.—Direct, Post paid, to A. H., Church-street, Epsom, Surrey.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

FROM the last Official Stamp Returns published March 16, it appears, that during the three months of October, November, and December, in the past year, 1843, the Stamps applied to each of the under-mentioned Journals gave them an average Publication of:—

Gardeners' Chronicle & Agricultural Gaz.	5461
Morning Herald	5283
Morning Chronicle	5231
Mark Lane Express	4154
Spectator	3731
Sun	3347
St. James's Chronicle	3321
Record	3212
Observer	3154
Morning Post	3013
Globe	3000
John Bull	3000
Atlas	2347
Railway Times	2770
Standard	2565
Patriot	2308
Bell's New Weekly Messenger	1731
New Farmer's Journal	1431
Mining Journal	1404
Herapath's Journal	1231
Gardeners' Gazette	1066

The weekly circulation of the Gardeners' Chronicle and Agricultural Gazette is at the present time (March 20) above 7000, as will be seen by the next Parliamentary Return.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—SOUTHAMPTON MEETING.—Prize-Sheets and Regulations for the Exhibition of Stock, Implements, &c., together with the blank Printed Forms of Certificate required to be filled up by Exhibitors, and copies of the printed Programme of the Meeting, may be had on application, either personally or by letter, addressed to the Secretary, No. 12, Hanover-square, London.

Exhibitors are particularly requested to observe, that all Certificates for Implements, &c., must be sent, complete, so as to reach the Secretary on or before the FIRST OF MAY; and all Certificates for Stock on or before the First of June.

By order of the Council, James Hudson, Secretary.

London, March, 1844.

SODENS' EARLY OXFORD POTATOES.

HURST and M'MULLEN, Seedsmen, No. 6, Leadenhall Street, London, still continuing to receive numerous orders for the above celebrated Potato, feel it their duty to inform their numerous friends, and the public generally, that the entire Stock is all sold. They have made arrangements, for another season, with Mr. Soden, to grow a larger supply, and beg to solicit early orders, to prevent disappointment. They have still on hand Martin's new early Globe, new early Wiltshire Kidney, and several other approved varieties. See their Advertisement in this day's Paper.

RANUNCULUSES, ANEMONES, PELARGONIUMS, AURICULAS, CARNATIONS, AND LILIUM LANCIFOLIUM.

H. GROOM, Clapham Rise, near London (removed from Walworth), by Appointment Florist to Her Majesty, begs to inform the Nobility, Gentry, and Amateurs, that, in consequence of the success he has had in the cultivation of the above flowers at his new Garden, he can offer them at very moderate prices. He would particularly recommend an early application to be made for RANUNCULUSES and ANEMONES, as they should not be planted later than the end of March to ensure a good bloom. His Catalogue of PELARGONIUMS, AURICULAS, and NEW PLANTS, is now ready, and will be forwarded by post on application. The Trade supplied.

FUCHSIA.—MARNOCK'S Princess Sophia.—This beautiful FUCHSIA, which was raised by an Amateur, and purchased by Messrs. Marnock and Manley, is a dazzling vermilion; thick, glossy, substance; large tube, and, excessively brilliant; corolla, dark purplish rose, well expanding and forming a beautiful contrast from the sepals. Plants in April, 10*s*. 6*d*. each; an allowance to the trade if three or more plants are taken at a time. Their Catalogue of Fuchsias, Verbenas, Cinerarias, &c., containing every variety worthy of cultivation, with many new varieties of Cinerarias, &c., not yet let out, is now ready, and may be had on application at their Nursery, Hackney.

N.B.—Every description of choice Flower-seeds, at advertised prices.—March 22, 1844.

FINEST CARNATIONS AND PICOTEES.

YOUELL AND Co. beg to refer the Readers of the *Gardeners' Chronicle* to their Extensive List, with Prices, of the above highly esteemed Flowers, which appeared on the Advertising pages, 706 and 707, of this Paper, of October the 14th, and will be found to contain every variety worthy of cultivation.

Prices as follows:	£.	s.	d.
12 pair of good Show Sorts	1	4	0
12 ditto fine ditto	1	10	0
25 ditto ditto	2	0	0
12 ditto extra fine and very superior ditto	2	10	0
25 ditto ditto	5	0	0

The selection being left to Youell & Co.

ARAUCARIA IMBRICATA.

Recently planted most extensively at Her Majesty's Gardens at Windsor, and also at the Royal Gardens, Claremont, furnished by Youell and Co.

YOUELL AND Co., possessing the most extensive stock in the country of the above Splendid Hardy Ornamental Tree, beg to offer them on the following advantageous terms:—Fine robust 4-year-old plants, 8 to 10 inches high, 10*l*. per 100, or 30*s*. per dozen.

Fine Plants of CEDRUS DEODARA, 2ft. to 2ft. 8 ins., 10*s*. 6*d*. each.

Great Yarmouth Nursery, March 21, 1844.

N.B. All Orders above £2 will be delivered carriage free either to London or Hull.

NEW FUCHSIA "ADONIS."

T. PULLEN begs respectfully to call the attention of Nurserymen, Florists, and Amateurs, to the above SEEDLING, which has been pronounced by all who have seen it to be a splendid variety. The flowers are very large, and a very bright colour, with a very waxy substance; is a strong grower, with very fine foliage, and free bloomer, &c. Plants may be had the first week in May, at 5*s*. each, of the Raiser, or of Messrs. Hurst and M'Mullen, Seedsmen, 6, Leadenhall-street, London; who have seen the flowers, and will answer to any inquiries respecting its merits, &c.—Midhurst Nursery.

BUSHELL'S Light Seedling Dahlia, "Emma."—Plants in May, 10*s*. 6*d*. Colour white, tipped with deep cherry; the petals, form, and centre, good; the largest, most constant, and free in flowering of any Dahlia yet propagated, and has obtained several prizes. "Pet Rival" Plants in May, 5*s*. Colour, purple maroon; fine cupped petal and free bloomer; exhibited in several winning stands last season. Kennington Rose, Plants in May, 5*s*.; most constant Rose grown. To be had of Messrs. Ansell, Camden Town; S. Girling, Stowmarket; F. & A. Smith, Hackney; and J. Bushell, 12, Hall-place, Kennington-lane.

SEEDLING FUCHSIAS.

W. PAWLEY, of the White Hart Hotel, Bromley, Kent, begs to inform the Nobility and Gentry that he has purchased the entire Stock of three splendid Fuchsias, which he intends sending out in April next, at 10*s*. 6*d*. per plant. They are considered by competent and practical men to be the best known, and twice the size of any yet in cultivation.

Queen.—A large Flower, a very free bloomer, and of good habits. Colour, a delicate light Pink, and a beautiful Rosy Vermilion Corolla.

Prince of Wales.—A very large bold Flower, and good substance. Colour, a bright Crimson, with an extraordinary large Violet Corolla. Magnet is also a large long Flower, good substance, habit, and a free bloomer.

To prevent disappointment, which is too often the case with new Flowers, the public are requested to come and see them before purchasing. Early orders are solicited, as the stock is limited, having broke very sparingly. A specimen of each will be open to any three Seedlings of 1843, grown from young plants, for the sum of 5*l*. To be exhibited at the West Kent Exhibition, held at Blackheath, in June next. N.B.—If accepted, notice to be given this month.—Bromley, March 22, 1844.

DAHLIAS.—KEYNE'S Standard of Perfection, DODD'S Orange Superb, and DOWDING'S Emma Noke.—The Stock of these splendid DAHLIAS is in fine condition, and will be sent out the 1st of May. A List of the Nurserymen who have ordered and can supply Plants, will be advertised the 1st of April. Gentlemen who intend growing these varieties may, by giving early orders, depend on fine Plants the first week in May.—Salisbury, March 5, 1844.

DILLISTONE'S APPLE, the STURMER PIPPIN.—From the satisfaction given last season by the mode of transmitting by post scions of the above most valuable Apple, to distant parts of England, Scotland, and Ireland, S. & J. Dillistone are again induced to offer it in packets (true from the original tree), post-free upon receipt of a Post-office order, payable at Halstead, for 3*s*. 6*d*., or the amount in stamps.

The Editor of the *Gardeners' Chronicle*, in "Notices to Correspondents," Nov. 25, 1843, says—"The Sturmer Pippin deserves the character given of it."

Mr. Rivers, in the Supplement to his Fruit Catalogue, says—"The Sturmer Pippin again deserves noticing, for its excellent qualities; it seems to grow and bear well in all soils and situations, and will supply the desert or kitchen from March till July. It can be grafted with success till middle of May."

A choice Collection of Roses, Dahlias, Pansies, &c. &c. Nursery Stock in general.—Sturmer Nurseries, March 22, 1844.

PETUNIA PUNCTATA.

W. MILLER refers the readers of the *Gardeners' Chronicle* to his full advertisement of this beautiful flower—just remarking that its *Strong, Dwarf habit*, and *Glossy Dark Green* foliage, (by far surpassing any Petunia yet out), renders it a desirable object for every greenhouse, and especially to all Exhibitors. Strong plants in April, 7*s*. 6*d*.

W. M. can still take orders for his cheap and new Fuchsias and Verbenas, as advertised.

Fuchsias.		Verbenas.	
12 Fine distinct sorts	7*s*. 6*d*.	12 Distinct sorts	3*s*. 6*d*.

N.B.—Printed Lists can be had of Pelargoniums, &c.

William Miller, Providence Nursery, Ramsgate, March 19.

SEEDLING FUCHSIAS, PHLOXES, and VERBENAS.

S. GIRLING begs to inform the admirers of the above, that he will have fine healthy plants of his superb Seedlings ready for delivery by the 20th of April. S. G. offers them with the greatest confidence, being well convinced of their superiority over any others he cultivated last year, which included about 100 varieties. The Fuchsias have been seen by Dr. Lindley, whose opinion on their merits will be found in the *Gardeners' Chronicle*, pages 528 and 561, of 1843, under the signature "*S. Girling.*"

FUCHSIAS.

CANDIDATE.—Deep crimson tube and sepals, petals bright violet-purple, reflexing so as to show the corolla. Price per plant, 5*s*.

GLOBOSA COCCINEA.—Tube nearly globular, dark vermilion, sepals and violet petals. 3*s*. 6*d*.

HERO OF SUFFOLK.—Dr. Lindley's description of this is—"No. 5 is a handsome seedling, with short crimson vermilion tube and sepals of good substance, the latter expanding so as almost to reflex, after the manner of Magnifica; stamen and pistils much exserted." Price 7*s*. 6*d*.

PHLOXES.

KING OF THE WHITES.—The best white out; height 3 feet. Price 5*s*.

SPECTABILIS.—Shaded lilac, very fine, height 3 feet. 3*s*. 6*d*.

DRUMMONDI, var. SPLENDENS, a new annual of great beauty, being of the richest crimson scarlet, and quite circular in form. In packets of 12 seeds; 2*s*. 6*d*. per packet.

VERBENAS.

DEFIANCE.—Bright rosy pink; the best in its class. 3*s*. 6*d*.

TRESOR PARFAIT.—Bright violet-purple, shaded with deep crimson; quite distinct from any Verbena known. 3*s*. 6*d*.

S. G. also begs to state that his Catalogue of Florist's Flowers is ready, and may be had on prepaid application; it will be found to contain nearly every novelty of the season, any of which S. G. will be happy to receive orders for, and which shall have every care and attention. The Fuchsias and Verbenas will be sent by post, free of charge, where preferred. The Phloxes are now ready for delivery.

Dane Croft Nursery, Stowmarket, March 23, 1844.

WOODLANDS NURSERY, MARESFIELD, near Uckfield, Sussex

WILLIAM WOOD AND SON have much pleasure in acquainting their numerous Patrons and Friends that they have been appointed Agents for the sale of that most invaluable article—WHITNEY'S CHEMICAL TRANSPARENT WATERPROOF COMPOSITION, samples of which may be seen, and the composition in use, at Wood and Son's Nursery. Sold in bottles, with ample directions for use, pints 2*s*. 6*d*., quarts 4*s*. 6*d*. each. Discount to the Trade.

SEEDLING FUCHSIA, CACTUS, and PANSY, HOLLYHOCK SEED, &c.—LYNCOMBE VALE NURSERY, BATH.

J. KITLEY begs to inform the Nobility, Gentry, and the Public that he has purchased of Mr. Pond his unequalled SEEDLING FUCHSIA (PONDII), allowed by all who have seen it to be one of the largest and handsomest Fuchsias of the day; tube and sepals bright crimson, with darker corolla, and extremely free bloomer; fine compact habit; cannot fail to give satisfaction. 5*s*. per plant.

J. K. has a few more plants of fine SEEDLING CACTUS (SPECIOSA SUPERBA), 10*s*. 6*d*. per plant. Also, good healthy plants of his SEEDLING PANSY (LYNCOMBE VALE RIVAL). This Flower, both for shape and decision of colour, is decidedly the best light PANSY out. 3*s*. 6*d*. per plant.

J. K. can recommend his HOLLYHOCK SEED, with the greatest confidence, having taken great care to select from his best full and very double Flowers of 1843 20 distinct varieties, named to colour, which he will forward to any purchaser post-free, on the receipt of a Post-office order for 5*s*. The whole of the above are now ready to send out.—Bath, March 20, 1844.

SUPERIOR SEEDLING FUCHSIAS, VERBENAS, AND DAHLIA—"HAMPSTEAD RIVAL."

G. SMITH begs to call particular attention to his New Seedlings, which G. S. flatters himself will give satisfaction, as they far surpass anything in their class.

FUCHSIA—"London Rival" has been exhibited at Chiswick, and at the Royal Botanic Gardens, Regent's Park; also submitted to the Editor of the *Gardeners' Chronicle*, Aug. 19, 1843, whose opinion of it is as follows:—G. S.'s Fuchsia, London Rival, is a handsome variety, with dark purplish vermilion tube and sepals, the latter opening so as almost to reflex, showing the large crimson purple corolla to great advantage in growth, and free flowering habit of Moneypenii, 7*s*. 6*d*. per plant.

FUCHSIA—Cylindria superba is described by Mr. Glenny as being the most vivid scarlet that can be conceived, and as having a singularly interesting appearance; it is of strong growth, and a free blooming variety, 5*s*. per plant.

FUCHSIA—Globosa grandiflora; much larger and superior to Globosa major, 5*s*. per plant.

VERBENA—Excelsa obtained a first-class prize at the July Show, Royal Botanic Gardens of London, and is a very large compact flower, quite new in colour, being a deep Rose, extra fine, 5*s*.

VERBENA—Delicata, a fine blush changing to pink, very compact and large, 3*s*. 6*d*. per plant.

VERBENA—Arrata, a fine free flowering red with white eye, 3*s*. 6*d*. per plant.

VERBENA—Striata, scarlet striped with pink, 2*s*. 6*d*. per plant.

DAHLIA—Hampstead Rival (Cowing's), a Rosy crimson, rising high in the centre, with a great depth of superior formed petals, and is warranted a noble show flower, constant, 4 feet, 10*s*. 6*d*. per plant. Strong plants will be ready by April 20.

London Agents:—Messrs. Warner, 28, Cornhill; Smith, Hackney; and the Metropolitan Union.

Country Agents:—Messrs. Youell, Great Yarmouth Nursery; Stewart, Salt-hill Nursery; Cripps, Tunbridge Wells; and E. Tilley, Bath.

*** Nurserymen or Florists becoming Agents, their names will appear as received in this Paper.

Tollington Nursery, Hornsey Road, Islington.

WOOD'S SUPERB SCARLET PHLOX DRUMMONDII.

J. WOOD begs to announce that, owing to the late unfavourable season, the stock of seed of this beautiful Annual, which gave such universal satisfaction last year, is very small, and that it will in consequence be sold at 2*s*. 6*d*. per packet as last year. Town Agents, Hurst and M'Mullen, 6, Leadenhall-street, Huntingdon Nursery.

N.B. This Advertisement will not be repeated.

GREAT YARMOUTH NURSERY, NORFOLK, 1844.

YOUELL AND CO.,

PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN; HIS MAJESTY THE KING OF THE BELGIANS; NURSERYMEN AND FLORISTS BY SPECIAL APPOINTMENT TO HER MAJESTY THE QUEEN DOWAGER.

A SELECT CATALOGUE of the NEWEST and VERY BEST VARIETIES OF FUCHSIAS, VERBENAS, PETUNIAS, CHRYSANTHEMUMS, & ANAGALLIS, offered by YOUELL & Co.

YOUELL & Co., in submitting their Catalogue of FUCHSIAS for 1844, take this opportunity of drawing the attention of admirers of the above elegant tribe of plants, to their select and superb Collection. They have spared no expense in forming a selection of such as are really good, to the exclusion of many that are mere nominal varieties; and they would refer to the numerous testimonials of success which attended their mode of selection last season, collections for Amateurs, for competition at the various Horticultural Exhibitions throughout the kingdom.

YOUELL & Co. being the parties who first sent out per post, with safety, these tribes of plants, are desirous of calling attention to their advantageous method of executing orders, namely, that they will deliver them free of postage (on the receipt of a Post-office order), to any part of the United Kingdom, upon the following terms:—

12 Extra Fine varieties, 12*s.*, the Selection left to Youell & Co.
12 ditto ditto 21*s.*, the Selection left to the Purchaser.
50 Fine varieties . . 40*s*, the Selection left to Youell & Co.
50 Extra Fine ditto . 60*s.*, the Selection left to the Purchaser.

With the exception of those marked thus. *

The plants will be strong and healthy, and ready for delivery by the latter end of March, with the exception of those marked thus * (which will be ready in April), thus ensuring the Purchaser fine plants for competition in the ensuing season. Many of the varieties can be supplied now.

NEW AND SPLENDID SEEDLING FUCHSIAS.

* "FUCHSIA LINDLEYANA." This brilliant Fuchsia, the entire stock of which is in the possession of YOUELL & Co., is now for the first time offered to the notice of the public.

Its exceedingly large tube and sepals are of the most vivid vermilion, and excessively expansive, surpassing in brilliancy any hybrid that has yet been raised. It was exhibited at the London Horticultural Society's Meeting, Regent-street, and greatly admired, and was pronounced by all who saw YOUELL & Co.'s specimen plant to be the most dazzling object of this tribe they ever witnessed. The foliage and habit exceedingly fine, a most abundant bloomer, and will be found a desideratum to every collection. Plants will be ready for delivery by the first week in April, at 7*s.* 6*d.* per plant. Usual discount to the Trade, when not less than six plants are ordered.

YOUELL & Co., in calling the notice of Amateurs and others to the following seedling Fuchsia, raised in their nursery, beg to state that in the summer of 1842 they bestowed every care in hybridising the best varieties in cultivation, from which they succeeded in raising upwards of 3000 plants, to the flowering of which one house was entirely devoted last year. And although many varieties possessing superior claims to the attention of those cultivating this elegant tribe, were submitted for the opinion of Dr. LINDLEY, and most favourably noticed, yet YOUELL & Co. feel that, in making a selection of the following six varieties, to which a most accurate description is affixed, will prove not only satisfactory to the purchaser, but to themselves.

These will be ready for delivery in April next, and as the stock is very limited, early orders are solicited.

* "QUEEN VICTORIA." Tube and sepals smooth, of a bright vermilion, corolla stout, long, of a fine purple rose colour, forming a good contrast, and of fine texture, price 7*s.* 6*d.* per plant.

* "PRINCE OF WALES." Tube and sepals rosy vermilion, the latter tipped with green, expanding well, and showing a fine corolla of maroon purple; price 7*s.* 6*d.* per plant.

* "PRINCESS ROYAL." Tube and sepals bright red, corolla large and peculiarly bright in colour; price 5*s.* per plant.

* "MARCHIONESS OF NORMANBY." This is a large and showy flower, measuring four inches from the commencement of the pod to the termination of the pistil, tube and sepals scarlet, corolla stout, having a tinge of purple on it; price 7*s.* 6*d.*

* "LADY ALICE PEEL." A flower of good form and substance, fine rosy red tube and sepals, the latter terminating in a decided green, corolla very large and stout, of a beautiful crimson purple; price 5*s.* per plant.

* "LADY WALSINGHAM." Tube and sepals smooth, of a rosy vermilion, the latter turn up, and expose the whole of the corolla, which is stout, and of a fine purple crimson; price 5*s.* per plant. When the six are ordered, they will be charged 1*l.* 11*s.* 6*d.* the set.

"FUCHSIA QUEEN." Quite new, very beautiful, and not yet out, tube and sepals large and stout, of pure white, showing a dark crimson corolla; price 10*s.* 6*d.* p. plant; ready in April next.

Fuchsia Seed, saved from the best varieties, 6*s.* to 10*s.* per packet, with Directions for sowing, &c. &c.

With every other variety worthy of cultivation, that may be advertised by other parties after the publication of this list.

YOUELL & Co. are preparing a short treatise upon their successful mode of cultivation of the Fuchsia, which will be presented Gratis to Purchasers.

VERBENAS.

*"MONARCH" (Youell's) is a delicate creamy white, surpassing in its size and fragrance every other variety; the tufts of bloom measuring from 3¼ to 4 inches diameter, and will be sure to give satisfaction. Price 5*s.* per plant.

* "BRILLIANT," (Youell's). This fine variety is of the most vivid scarlet, equal in this respect to "Melindris;" the bloom, however, is three times the size, and very fragrant, and will prove most desirable in any collection. Price 3*s.* 6*d.* per plant.

*"ELEGANS" (Youell's), is a most interesting variety, being a delicate lilac, with a distinct white eye; flower large and fragrant. Price 3*s.* 6*d.* per plant.

*"SURPRISE" (Youell's), can be recommended as a variety completely novel, and one that must be cultivated in every collection, the colour being of the richest rosy crimson, or ruby, producing tufts of flowers of 3½ ins. in diameter, and delightfully fragrant. Price 5*s.* per plant.

The above four varieties have been selected from upwards of 2000 Seedlings, and may be confidently relied upon as possessing superior claims, and will be sure to give satisfaction; will be ready to send out in April next (post-free). If the four varieties are taken, they will be charged 15*s.* the set.

Burroughes, of Lingwood Lodge, Norfolk, and kindly presented by that gentleman, to Messrs. YOUELL & Co., for particulars of which see their Advertisement in this Paper of the 16th of Sept.

SPLENDID LARGE, DEEP-BLUE ANAGALLIS and SUPERB CINERARIAS.—Plants of that large, splendid deep-blue, full and complete round-petalled ANAGALLIS BREWERII, being of a strong and vigorous habit, are well adapted for bedding out; 12*s.* per dozen.

SUPERB CINERARIA SEED, saved from the most esteemed named kinds, and other new and beautiful Seedlings, comprising every shade of dark and light-blue, at 2*s.* 6*d.* per packet. Strong flowering plants of the above, 12*s.* per dozen. Applications, including Post-office orders, will be immediately executed.—Direct to MICHAEL BREWER, Sen., Cambridge Nursery.

MELON SEEDS.—A very liberal Remuneration will be given for some PERFECTLY PURE AND GENUINE SEEDS of the under-named Melons; or Seeds procured the last year direct from China, Cabul, and Candahar, will be given in exchange:—Striped Hoosainee, Daree, Geree, Garmek, Melon of Gerger, Nukshevan, Sweet Melon of Ispahan, and Italian Green-flesh.

Application to Mr. G. MILLS, Gardener, Gunnersbury Park, Acton, Middlesex.

WM. JOHN CORMACK, AGRICULTURAL SEEDSMAN by Appointment to His Royal Highness PRINCE ALBERT, New Cross, Surrey, and Bedford Conservatory, Covent Garden, begs to call the attention of the Nobility, Gentry, and Agriculturists in general to his combinations of GRASS SEEDS for Permanent Pasture, the Alternate Husbandry, Parks, Lawns, &c. (as recommended and practised by his partner, the late Mr. GEORGE SINCLAIR, Author of the "Hortus Gramineus Woburnensis.") Upwards of 25,000 acres have been converted to permanent pasture by this establishment with the greatest success. Parties requiring Seeds are respectfully requested to state the nature of the soils. Mangold Wurtzel, Carrot, and Turnip-seed of excellent sorts, saved from transplanted bulbs. Garden and Agricultural Seeds of the best quality and most approved kinds.

N.B.—Cormack's British Queen and Prince Albert Peas, at 3*s.* 6*d.* per quart.

TURNIP SEED, &c, at CHESTER.

FRANCIS AND JAMES DICKSON beg to announce to the Farming community and Agriculturists in general, that having succeeded in saving an unusually large quantity of their "IMPROVED PURPLE-TOPPED SWEDISH TURNIP," (originally from the reputed Ashcroft's Stock, but annually picked and transplanted under their own superintendence), they are enabled to offer it on very low terms.

Also "DICKSON'S PURPLE-TOPPED HYBRID SCOTCH YELLOW," a hardy and much-admired variety. Laing's East Lothian, Pink-topped, Victoria, and other Swedes; White and Cream Globe; Dale's, Gordon's, and several Hybrids; Red, White, and Green Round Turnips, &c. &c.

F. and J. D. have likewise on sale all kinds of FARM SEEDS, in the selection of which they pay particular attention. Mangold Wurtzel, Carrots, Parsnips, Clovers, Imported Scotch Seed Oats, Barley, and Rye-grass. Grasses for Permanent Pasture, &c. &c.

Orders are respectfully solicited, in the fulfilment of which every attention will be paid.—Chester, 20th March, 1844.

LAWN GRASS-SEED.—Mixtures of the finest kinds of GRASSES and CLOVER, warranted to insure a fine Sward (allowing two quarts to the square rod), 14*s.* per bushel. Sent carriage-paid to London, in not less quantity than half a bushel. Mixtures for Lawns intended to be fed, 10*s.* per bushel.

JOHN RIVERS, Sawbridgeworth, Herts.

G. CHARLWOOD, 14, Tavistock-row, Covent-garden, begs to inform his numerous Friends and the Public in general, that his Catalogue of AMERICAN SEEDS is now ready for distribution. In it will be found Cones of Pinus Douglasi, 21*s.* per doz.; likewise, his new General Catalogue, containing all the newest and most improved Vegetable and Flower Seeds; together with an abridgment of the same, containing the more select and rare Sorts.

He has likewise received his annual importation of German Stocks, Asters, Wall-flowers, Carnations, &c., &c. List, with prices, will be found in the Abridgment.

G. C. having been many years in the habit of making mixtures of the different kinds of Grasses for Pasturage of all descriptions, can supply the same from 24*s.* to 36*s* per Acre; or, in distinct Sorts, as may be desired. The finer Sorts, mixed for Lawns, at 1*s.* 6*d.* per lb. Also Lucerne, 1*s.* per lb. White Belgium Carrot, 1*s.* per lb. Altringham Carrot, 1*s.* per lb. Mangold Wurtzel, 1*s.* per lb. Yellow and Red Globe Mangold, 1*s.* per lb. Laing's improved Swedish Turnip, 1*s.* per lb. Skirving's do., do., do., 1*s.* per lb. All other Sorts of Agricultural Seeds equally low, and of genuine quality.

AMERICAN FOREST-TREE and SHRUB SEEDS.—A consignment of 24 barrels recently received are offered FOR SALE, either entire or in separate portions, as may suit the convenience of the cultivators of them.—For further particulars apply to GEORGE CHARLWOOD, Seedsman, 14, Tavistock-row, Covent-garden.

The assortment consists of the following articles:—Andromeda, arborea, Mariana, and paniculata; Alnus serrulata, Acer rubrum, montanum, and striatum; Betula populifolia and excelsa; 1 bushel Cratægus pyrifolia, Cornus florida, 2 lbs. Cercis Canadensis, 4 lbs. Ceanothus Americana, 16 lbs. Diospyros Americana, Fraxinus tomentosa, acuminata, and sambucefolia; 14 lbs. Gleditschia triacanthos; Hibiscus syriaca et spec.; 1 bushel Ilex Opaca; 7½ bushels Juniperus Virginiana; 2 bushels Juglans tomentosa; Kalmia angustifolia, latifolia, Laurus Benzoin, Ligustrum Americana; 3 pecks Myrica cerifera; Magnolia glauca, grandiflora, and macrophylla; Prinos verticillatos, Phytolacca decandria, Philadelphus inodorus and grandiflorus; In cones—18 bushels Pinus nigra; 2½ bushels P. balsamea; 2½ bushels P. Canadensis; 7½ bushels P. rigida; 3 bushels P. alba; 3 bushels P. microcarpa; 2½ bushels P. strobus; ½ bushel P. variabilis; 3½ bushels Quercus coccinea; 1 bushel Q. tinctoria; Rhus glabrum Vernix; 1½ bushel Sorbus Americana; 4½ bushels Thuja occidentalis, and several other articles.

G. C. begs to inform his friends and customers that this consignment is totally distinct from his usual supply, of which a priced list may be obtained by application.

PASTURE AND LAWN GRASSES of the Finest Quality, selected for every description of soil, consisting of Poas, Fescues, Gold Grass, Meadow Foxtail, &c., with a moderate supply of Clover, will enable Noblemen and Gentlemen to lay down upon very reasonable terms. Particulars of quantities suitable to various soils to be had, with an estimate of the cost per acre, by application to WARNER and WARNER, Seed-merchants, 28, Cornhill, London. Genuine Italian Rye-Grass, Mangold Wurtzel, and superior selected Turnip-Seeds.

TO PINE GROWERS.

TO BE SOLD BY PRIVATE CONTRACT, between 400 and 500 Fruiting and Succession PINE PLANTS, principally composed of Queen's, Black Jamaicas, White Providences, Black Antiguas, and other good varieties. The whole are in a very healthy, clean condition, and will be found worthy of notice. For Particulars apply to Messrs. JANSON and FINNEY, Gateshead Nursery.

TO GENTLEMEN, FLORISTS AND OTHERS.

MESSRS. PROTHEROE & MORRIS will offer at the Auction Mart, Bartholomew Lane, on Tuesday, March 26th, the remaining Standard and Dwarf ROSES and DAHLIAS; and on Thursday, 28th, a stock of CARNATIONS and PICOTEES, PINKS, NEW FUCHSIAS, HEARTSEASE, &c., the stock of a celebrated Grower; may be viewed the morning of sale. Catalogues may be had at the Mart, and of the Auctioneers, Leytonstone.

"PETUNIA PUNCTATA."

WILLIAM MILLER intends to give a List in next week's *Chronicle* of those Nurserymen that have ordered Plants of this unrivalled Flower. Other Nurserymen who wish their names to be added, must send their orders immediately.

Providence Nursery, Ramsgate, March 21, 1818.

CHOICE PANSIES.

J. HENCHMAN begs to inform cultivators of the PANSY that he is now sending out healthy plants of six good seedling varieties, for 21s. the set. Also a few choice kinds at 15s. and 18s. per dozen.—Edmonton, March 1844.

WOODLANDS NURSERY, MARESFIELD, near Uckfield, Sussex.

NEW and SUPERB FUCHSIAS, VERBENAS, PETUNIAS, CINERARIAS, CAMELLIAS, GREENHOUSE and HERBACEOUS PLANTS, HARDY CLIMBERS, and Plants adapted for bedding.

WM. WOOD & SON beg to inform their Friends and Amateurs that a Catalogue of the above, together with a List of entirely new ROSES, is now ready, and may be had GRATIS on application.

The Gardeners' Chronicle.

SATURDAY, MARCH 23, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, March 27	Society of Arts	8 P.M.
MONDAY, April 1	Entomological	8 P.M.
TUESDAY, April 2	Horticultural	8 P.M.
	Linnean	8 P.M.

THE well-known experiment of conducting a portion of the unburnt gas from the interior of a candle-flame, and then lighting it at the end of the tube, forms the basis of Mr. Williams's reasonings in behalf of his IMPROVED FURNACE. This experiment, which we recall to mind by the annexed diagram, is assumed as proving that the whole of a gaseous current will never be consumed unless some extraordinary means be previously taken to intermix the gas with the air, whose oxygen is to combine with it. "If, then, the free unrestricted access of air on all sides of this small flame is not able by force, attraction, or the laws of diffusion, to form a due atomic mixture in time for ignition, *à fortiori*, it cannot do so when the supply of air is restricted, and that of the gas increased."

These words form the conclusion of Mr. Williams's notice of the experiment in question, and he proceeds to contrast it with the combustion of an argand lamp (his furnace being called the *Argand* furnace), in which he infers that no such phenomenon could be exhibited. We think, however, that there is a slight error in supposing that because some portion of unburnt gas can thus be abstracted and afterwards inflamed, that it would not have been equally burnt if left to itself. There is little doubt, we apprehend, that the upper part of every flame consists of the gas which but an instant before had formed the yet unconsumed central portion of the volume, and which might have been conducted away and burnt at the end of a tube instead of rising to increase the length of the original flame. We think there is a second error in supposing that in this respect there is any essential difference between the flame of an argand lamp and that of a candle. The combustion in the flame of the argand-lamp is, like that in the candle, successive. The flame has length in proportion to the supply of gas, because each portion of gas requires to be brought to the surface of the flame, in order to gain access to the air; and there is exactly the same central portion of temporarily unburnt gas, throughout the entire ring of the argand flame as there is in the candle, and which may be in the same manner abstracted and burnt at the end of a tube thus.

The great distinction between an argand lamp and a candle consists in the chimney, for without the chimney the best oil in an annular wick burns less perfectly than the commonest tallow with a simpler form of cotton. Besides the draught produced by the chimney, and the consequent increased supply of air, the contraction or shoulder in the chimney drives the ascending current of air forcibly against the rising gas, and compels an intermixture of the air and gas, which is highly favourable to combustion, and which may easily furnish hints for the construction of furnaces.

The effect of this contraction in the chimney, and indeed of any contrivance by which an inflammable gas and the air are made to impinge against each other is very strikingly shown in the recently-invented lamps for burning highly rectified spirits of turpentine. In these, a narrowing of the chimney corresponds with a metal button over the centre of the flame, by means of which the mutual penetration and intermixture of the two currents is made much more complete than in the common Argand lamp, and therefore a material is caused to burn without smoke, which, without some such extraordinary provision, fails to obtain a sufficient supply of oxygen from the air for its complete combustion.

These lamps exemplify very conclusively the leading argument of Mr. Williams, that, in order to obtain chemical combination, it is not sufficient to bring the materials into mere juxtaposition, though they may leave some doubt as to whether the means he proposes are the only ones, or the best for the purpose. The public is much indebted to him for the perseverance with which he has followed out the subject, but we think his own illustration of the Argand lamp scarcely does justice to this invention.

In the annexed diagram we have shown how simply and easily the benefits, real or supposed, of the contrivances in question may be obtained in furnaces resembling those generally used for Horticultural purposes. The apertures in the brickwork marked by 4 arrows, which indicate the course of the entering current of air, are the only novelties, and *they* are new only in this peculiar arrangement, because, as we have already stated, air has been admitted behind the fire for the same purpose for very many years. In this arrangement, the air which enters by the four channels meeting the current of gas at right angles, or rather, indeed, opposed to it, would tend to produce that sort of forced intermixture which is secured in the turpentine-lamps by the peculiarly-formed chimney, and the deflecting button placed above the flame. Common open stoves for dwelling-houses have been made with grated sides and backs to admit air to the upper parts of the fuel, for nearly half a century. For furnaces, the mode of admission has been much varied, though it has never, we believe, been done exactly as proposed by Mr. Williams, nor as is suggested above. Many years since, a furnace was brought before the Society of Arts, and was published in their Transactions, in which the fire-bars are all tubes, through which the air is made to pass, and from which it escapes into a long narrow chamber formed in the *bridge* behind the fire, which communicates with the tubular bars, and from which it issues finally through a thin aperture. This arrangement was supposed to possess the double advantage of heating the current of air, and of cooling, and therefore preserving, the fire-bars. How far all this is accomplished we are not called upon to say; but this proposal, and many others, show that the attention of practical men has been long directed to the supposed necessity of giving air to the gases otherwise than through the fuel.

The first question therefore for any Horticulturist who wishes to avail himself of these advantages, is one having reference to patent rights. The air has been admitted through gratings, through long narrow channels, and through tubular fire-bars, but not through small perforations in bricks, as suggested by Mr. Williams. It may therefore be questionable whether the four or more apertures described in the above diagram, which are supposed to be eight or nine inches long, and an inch wide, could be used without infringing any patent. On this subject we, of course, do not offer an opinion; our business is merely to show with what facility provision may be made for admitting air above the fire in the boilers used by gardeners; because it will be obvious that the arrangement above described is perfectly applicable to conical, cylindrical, and indeed to all the boilers now commonly in demand, as well as to the horseshoe-form shown in the engraving.—*A.*

FUCHSIAS.

(*Continued from p.* 164.)

Having thus stated what the conditions are upon which the just preparation of soils depends, it will be of some interest to consider the separate parts which constitute a correct arrangement of soils in the process of potting. It has been shown by an illustration of § 1, that matter when circumscribed is subject to an undue attraction or cohesion of its parts, and that all arrangements of soil in pots being circumscribed, are, in the absence of some modifying agent, subject to cohesion by atmospheric and mechanical pressure. Suppose, for instance, a flower-pot without the bottom hole which admits the escape of superfluous water, and in that state filled with soil, it is obvious that the application of water, or any other agent which acts mechanically by pressure upon such a mass of confined matter, will naturally tend to lessen the distance between every particle of which the mass is composed, which will thus become, because of the cohesion of its parts, incapable of permitting the uniform action of other agencies (§§ 3, 6, 7.) This shows that the confinement of matter in garden-pots is attended by a loss of the mechanical force by which matter operates. Again, suppose the same amount of soil to be transferred to a pot with the ordinary bottom hole, and water to be similarly applied, it is clear that by the passage of the fluid, and the diminished confinement of the soil, its mechanical force is increased exactly in proportion to the continued agency which acts upon it. We know that the passage of moisture in pots is in proportion to the absence of any obstruction to the bottom hole, in consequence of potsherds over it. This will be clearer, if we consider that, as the gravitating tendency of all matter is to a common centre, and as the theory of gravitation or attraction implies an agent, namely, mechanical force (Herschel), so it is assumed that mechanical agency should be strictly in proportion to the amount of the circumscribed matter it is intended to affect (§ 7.) Admitting the correctness of this view, the reader is reminded that the whole base of an ordinary flower-pot surrounding the bottom hole is diametrically opposed to the natural arrangement of matter which admits the action of other agencies upon it, this defect being in all cases obviated by the internal arrangement of potsherds, which, acting mechanically, modify the pressure of the remaining parts.

The arrangement of the materials employed in potting may be defined to be—1. Bottom drainage by potsherds, &c., solely intended, according to general cultivation, to act mechanically, by preventing the obstruction of the cavity which regulates the chief drainage. 2. Sub-drainage, by coarse vegetable matter or soil, intended also to act mechanically, by the coarseness of its parts, and nutritively, by its progressive decomposition. 3. Soil, adapted for growth, acting mechanically by its peculiar texture, and nutritively by its uniform proportion of chemical properties.

That these parts should bear a strict relation to each other (mechanically and chemically), has been proved by the principles 7 to 10, inclusive.

In accordance with the opinion given in a previous Paper, which states that the vigour of plants is in proportion to the uniform excitability of their organs,* plants of Fuchsias from cuttings of the current year's growth are preferred to others; and when such are not procurable, the most vigorous, uniform, and short-jointed of one-year-old plants may be selected; and in all cases cuttings from the base or root of the plant are preferable to those from the maturer stem.

On receiving plants which may have been injudiciously potted, with a deficiency or disarrangement of drainage, it is nevertheless better to retain them in their pots (unless injured or broken), in order to regulate the circulation of their fluids, according to the existing state of the plant, as follows:—1st. If the bottom cavity shows, by its close position, that free drainage is impeded, enlarge the cavity externally with an iron wedge, in proportion to its defective state, and thus, without disturbing the vital function of the roots, the first simple remedial process is effected. 2d. If the growth of the plant is feeble, reduce it by pruning to the size which appears most favourable to a uniform and accumulated vigour. As the future figure of the plant is regulated by its first formation, the following rule may be given for plants of one year's growth, namely, a branch may be formed from every axil or bud, where already the small young leaves appear; but, where they are wholly absent, there is a risk of a very late development: this, however, will depend in some measure upon the uniform excitability of the plants, and upon the nature of the atmosphere to which they are exposed. 3d. Open the surface of the soil; and, 4th. Raise the pots either upon a shelf, or on inverted pots on an ordinary front platform of a stove or forcing-house, where the heat is maintained at from 55° to 70°, where they will require occasional waterings, with alternate syringings. The importance of syringing is in proportion to their continued exposure to strong sun-light, and an otherwise dry atmosphere; apart from other reasons, which will be hereafter noticed. In this position they remain until the buds are formed as young branches, and the roots are making their appearance at the enlarged cavity.—*William Wood, Pine-apple Place.*

(*To be continued.*)

ENTOMOLOGY.

ATTELABUS CURCULIONOIDES (*the Black-legged Coral Weevil.*)—There is no district, however barren, nor any period of the year, however cold and dreary, that will not afford amusement and instruction to the reflecting mind, if imbued with a taste for Entomology and other branches of Natural History. Even in the Polar regions our enterprising countrymen found various insects to capture and admire, and tropical countries are swarming with species which vie with the splendid feathered race in the brilliant lustre of their plumage. We need not, however, wander from our native land for amusement, if we are disposed to study the economy of insects; there is not a wood, field, or meadow, heath, or hedgerow, that will not present abundance of materials to those who seek diligently and zealously to explore the treasures that Nature has in store for those who become her admirers, and we are often rewarded in the pursuit when we least expect it. I remember rambling in a wood early in June, admiring the charming wild flowers which there adorn

* *Chronicle*, p. 739 (1843.)

every uncultivated spot, enlivened by the cheerful hum of busy flies, which hover over every sparkling leaf, when I was attracted by the singular aspect of the foliage of a sapling Oak, the basal half of the leaves alone appearing to be alive (fig. 1), whilst at the extremity was suspended a little sort of pod (fig. 2). On examining them attentively, I found each leaf cut through to the midrib on either side; the apical portion had been folded together, so that the two upper surfaces were applied to each other, an egg having been previously deposited near the apex, and the whole had then been rolled up, beginning at the extremity, by which process the broadest points of the leaves were often left sticking out. This operation being performed when the leaf has become soft and flaccid, from the division of the vessels, it rolls up firmly, and as it dries it becomes brown, hard, and very difficult to unrol, unless it be relaxed by moisture; and to expedite the extinction of vitality in this portion of the leaf, the animal eats a deep little hole in the midrib, about an eighth of an inch from the cut margin, so as to interrupt entirely the supply of sap beyond the point of the basal portion, which remains alive and adheres, of course, to the branch or twig of the tree.

Having collected about a dozen leaves thus transformed into the nidus of an insect, I soon returned home to commence unrolling one, and found within a quarter of an inch of the apex an egg, about the size of a small pin's head, smooth, translucent, yellow, and shining; it was nearly globular, and apparently loose, for it rolled off immediately, and in this instance I had employed no moisture in the unrolling which could relax the gum, by which eggs are generally attached. The leaves had, no doubt, been recently rolled up, for upon some of them I saw the Coral-red Weevils, which were very conspicuous, contrasted with the rich green foliage on which they were resting, and relieved by their jet-black legs. As this is nearly allied to a similar insect which I have bred from the Hazel, it will be advisable to describe the species before us, which Linnæus named

Attelabus curculionoides (fig. 3).—It is intensely black and shining; the thorax and elytra are bright red; the head is oval, with a small but prominent eye on each side; the nose is elongated, and forms a short punctate rostrum, a little dilated at the extremity, which is furnished with two mandibles, minute palpi, &c.; towards the base of this rostrum is a little tubercle, on each side of which are inserted the antennæ; they are longer than the head, straight, and 11-jointed, the two basal joints being a little shorter than the six following, the three apical ones forming a slender elongated club; the thorax is semi-ovate, and minutely punctured; the elytra are nearly twice as broad, very short, and rounded at the apex, indistinctly punctured, with nine punctured striæ on each, the sutural one short; the legs are long, the anterior appearing the longest; the thighs are stout, the tibiæ slender, a little curved, serrated, and bristly internally, with two small claws at the apex; tarsi longish and 4-jointed, two basal joints obtrigonate; 1st, the longest; 3d, bilobed and cushioned beneath; 4th, slender, clavate, furnished with two small but strong claws.*

Having seen many other sorts of trees similarly affected, I shall return to this subject as soon as I have ascertained the various species which are the authors of the work; and I doubt not they belong to the genera Rhynchites, Deporaus, and Apoderus.† The present species, however, will supply abundant employment to any one who has leisure to study its economy—for I saw nothing of the operation—which would be highly interesting. The mouth, as above stated, is at the extremity of the rostrum, and being furnished with jaws, it, no doubt, first cuts the leaf transversely, and afterwards the egg is deposited; from this we may infer, that the female is the skilful operator; but may not the male assist her in rolling up the leaf? which, it must be admitted, is a very curious piece of workmanship for so small an animal to execute. The natural size is exhibited by the curved line at fig. 4. The maggot of another species I have found in its leafy case, and although I have not discovered the pupa inclosed, it is certain that the transformation takes place where the larva is nourished, from my having witnessed the fresh-born Attelabus emerging from its cartridge-like cell.—*Ruricola.*

FAMILIAR BOTANY.

MORPHOLOGY, No. VIII.

(Continued from page 165.)

"Ohne studium der Entwickelungsgeschichte giebt es keine Wissenschaft der Botanik."—SCHLEIDEN.

OUR first two steps have carried us over the threshold of Morphology, and have shown that in the first place all the kinds of matter known in the vegetable kingdom are little transformations of an extremely small number of physical elements; and in the second, that every herb, grass, or tree, is built up with one organic element only, differently fashioned by plastic force. As hydrogen, oxygen, and carbon are the foundation of all the tissue of vegetation, so is the cell, first-born and simple, the parent of every other, even the most apparently complicated and dissimilar form of that tissue; so that the succulency of plants, the toughness of timber, and the elastic springs that lie hidden within the veins of the leaf are all derived from one common state, through various transformations.

How wonderful and admirable is this simplicity! how much more consistent with our finite notions of the power and wisdom of God, than to suppose that a hundred different things are to be made in the first instance, and then put together after the fashion of man! How beautifully, let us add, is this marvellous plan adapted to the nature of the bodies in which it is worked out, and how inconceivable is it, by any one really acquainted with the true nature of created beings, that any other plan should have been adopted, or in fact that they could be fashioned in any other way.

Let us now direct our attention to the manner in which the tissue (or organic elements as distinguished from the chemical or physical) are themselves brought together when a plant is to be generated. The way in which the common Yew forms its embryo within the young seed may be taken as a beautiful example. (See a curious paper by Mirbel and Spach, in the Annales des Sciences for Nov. 1843). In this plant, as in all others, the young seed is in its earliest condition a mere bag of mucilage, containing rudiments of cells which gradually arrange themselves in a regular and somewhat honeycombed manner. After a time the interior is acted upon by the point of a pollen-tube, which is itself a cell drawn out into a long and even microscopically minute thread. Then begins an active change among the cells; from *a* and *b*, fig. 1, which are primitive cells of different kinds, extend others in the form of tubes, which pass irregularly into the cavity of the young seed, and there ceasing to lengthen, the next formed cells reassume their first condition, as at *c*. We must pay particular attention to the point *c*; the tubes themselves are but *suspenders* of that point, and undergo no very important change after they have once acquired their natural length; they become more numerous, and more solid, as at fig. 2; or they separate as at fig. 3 and 4, or they gradually become absorbed and disappear, as at fig. 5; all these alterations being consequent upon their growing older, and ceasing to be of use to the point *c*.

Now let us watch the changes in that point. At fig. 1 it is a little heap of cells; at fig. 2, it is older, and has become rather larger, but still is not materially altered; at fig. 3, it is becoming far more compact, and has assumed the appearance of a short cylinder of cells (part only of which are shown in this and the following sketches); at fig. 4, it has become some weeks older, is still larger, begins to separate from its suspender; and at fig. 5, when nearly perfect, it divides into two lobes and contracts at its base, possessing scarcely any connexion with the suspender, which has become useless, because the original point *c*, to nourish which the suspender was wanted, has advanced from a few cells, with scarcely a fixed form, through various intermediate changes, to the condition of an independent embryo plant, with two lobes or cotyledons which are rudimentary leaves, and a solid mass which represents the future stem and root. It is still, however, merely composed of cells, and in that respect has scarcely changed from what it was at the first hour of its birth.

Here we have a young plant in its embryo state indeed, but perfectly organised, formed by the gradual addition of cell upon cell, till it has gained its destined form. And out of these simple materials all the future fabric of the Yew-tree is to be produced.—*R. E.*

PLAN OF PINE AND MELON PITS AT WORSLEY GARDENS.

THE objects I wished to accomplish in erecting these were—1st. A circulation of air without loss of heat; 2d. A supply of moisture at command, proportionable to the temperature; 3d. A desirable amount of bottom-heat; and 4th, A supply of external air (when necessary) without producing a cold draft.

The method by which the first of these is accomplished will be understood by referring to the section in which *a* is the flow-pipe, *b b b* the return-pipes in the chamber A. It is evident that, as the air in the chamber becomes heated, it will escape upwards by the opening *c*, and the cold air from the passage (B) will rush in to supply its place; but the ascending current of heated air coming in contact with the glass is cooled, descends, and, entering the passage (B), passes into the chamber (A), where it is again heated; and thus a constant circulation is produced. In order to obtain the second object, I have to some extent combined the tank and pipe systems. The flow-pipe *a* is placed about half its diameter into the channel (C), which, when filled with water (or so far as is necessary) gives off a vapour exactly proportionable to the heat of the pipe and pit.

The third requisition is produced by the surrounding atmosphere and heating materials. The fourth is accomplished simply by lowering the upper sash; the cold air thus entering at the top only, falls directly into the passage (B), and passes through the hot chamber before coming in contact with the plants. In order to test the circulation, I fixed a piece of paper near the front of the pit, and found the current to be so strong as to bend it backwards and give it a tremulous motion. When the heat in the chamber is 95°, in the open space over the bed it is 71°, in the bottom of the passage only 60°, and in the mould in the bed it is 80°. The amount of vapour is regulated with the greatest facility, even from the smallest quantity to the greatest density. In one division of the Melon-pits, at present employed as a propagating house, the cuttings have for some time past been covered with a fine dew, and yet not one of them has been injured by damp. This I can only account for by the air around them being kept in constant motion.—*John Mitchell.*

Home Correspondence.

Functional Disease.—In the 10th Number of the *Gardeners' Chronicle* the possible existence of functional disease, apart from structural derangement in organised bodies, is maintained by a correspondent, who, in support of his position, compares the working of an animate organ to the operations of an inanimate engine, and asserts that because a want of due adaptation of the moving power of the latter to the work to be done is simply a functional derangement, therefore a deficient supply of moving power, whether derivable from nerves or blood-vessels, to the animate organ, causes also a purely functional disease. Does not a very small amount of consideration make it evident that this illustration is peculiarly unapt to the purpose for which it is professed that it is designed, and far more likely to mislead than to enlighten those readers who do not chance to be very well acquainted with the physiological and pathological workings of their animal machines? It appears to us that the cause of movement in all inorganic machines (for such we presume your correspondent to mean when he writes of inanimate), is simply and solely mechanical force, the operation of the physical properties of matter, whether elasticity or friction, or gravitation, upon matter endowed only with the like physical properties, although moulded into some peculiar form; in this case function springs out of rest. It would be of little use that the particles of steam were endowed with elasticity and expansibility, if the piston-plate had not also impenetrability and the moving parts inertia; and those very properties especially indispose the material of the engine to take upon itself structural change; so that its "diseases" and "derangements" must be solely from some mal-application of the moving power. But surely this is not the condition present in any animate "machine:" the moving cause there is continued change. The vital blood and nervous influence do not come to the animal organ as the steam to the high-pressure cylinder, or the moving stream to the wheel. They furnish to the living organism the material by which structural changes are immediately impressed upon its constitution—changes upon which its very existence as a portion of vital organisation hangs. The perfection of its intimate constitution requires the continued operation of waste and repair; and consequently, if what your correspondent calls the supply of the moving power—that is, blood and nervous influence—be withheld, the immediate consequence is the presence of structural disease. That there shall be no structural derangement it is required that that structure shall be continually and constantly renewed—that the affinities of the corroding oxygen conveyed by the blood shall seize upon the products of incipient decay, and remove them from the vital tissues, where their continued presence must be injurious. The happy father of a family who eats a hearty dinner, and hears of his collegiate son's death immediately,

that he may prove your correspondent's position, seems to us to have had his fit of dyspepsia rather unopportunely for that purpose; for surely it cannot be true that in his loaded organ of digestion there is "functional derangement without change of structure." The coats of his stomach are thrown into a state of great vascular activity, under the application of the stimulus of the imbibed food. That there shall not be structural derangement in the organ, it is required that a certain series of changes shall ensue; that a portion of the organ already in an incipient state of decomposition shall be mixed up with the loosened atoms of ingested material, to cause in them an analogous chemical change. But it so happens that by a sudden impression upon other organs of the animate individual, the series of changes constituting healthy action is checked; the organ becomes consequently structurally deranged; and the result is, that impairment of function becomes the evident indication of the concealed cause of the evil. In the inorganic engine of the mechanist, fixity of material is necessary to the perfection of the machine, so that when the active stimulus is withheld from it, no alteration in structure ensues, although it ceases from its work; while in the animal and vegetable organisation, loose chemical affinities and aptitude for continued change are the conditions required in order that it may do its work effectually; and when the needed stimulus is withheld from it, the necessary and unavoidable derangement of intimate structure is the immediate cause of functional disease; and that derangement may be either so subtle in its nature or slight in its degree, as to be only discovered by the disordered function which it has caused; or it may be so evident, as to be at once detected and known. And in this difference of degree, and this only, we presume, is to be found the source of the useful but inaccurate and unphilosophical division of the pathologist of structural and functional diseases. Your correspondent conceives that he disposes of sundry objections to his position, when he admits the agency of the blood as a motive power in animal organs. It is surely more important that he overlooks the fact, that it becomes a motive power only by inducing structural change. We are not quite able to see, being ourselves perchance but little skilled in the philosophy of harmony, the weight and bearing of the abuse of the poor musical instrument to the question at issue; but we yet have enough of practical harmony within us to hold the hand of good fellowship to "M. D." while thus differing from him in our views. And we offer to bet him, in good honest English mood, our earliest Rhubarb plant against his best Melon, that the next time he undertakes, in the routine of practice, to remove a functional disease, he will seek, notwithstanding his avowed theory, to call to his aid some remedy that will apply its energies to the structure of the deranged organ, either by mediate or immediate means; and, wishing him all the success practically, which theoretically we deem he does not deserve, we beg to remain—*Der Gref.*

Durability of Timber.—Your correspondent "P. P." in the *Chronicle*, p. 150, will find the following passage in Davy's Third Lecture on Agricultural Chemistry, at p. 139 of the 6th Edition, 1839:—"The woods that contain aromatic oils are remarkable for their indestructibility, and for their exemption from the attacks of insects; this is particularly the case with the Cedar, Rosewood, and Cypress. The gates of Constantinople, which were made of this last wood, stood entire from the time of Constantine, their founder, to that of Pope Eugene IV., a period of 1100 years."—*C. J. Lancaster.*

Aviaries.—In reply to "M. E.'s" inquiries relative to the description of birds suitable for an Aviary 17 feet by 12, I beg leave to state that I have kept birds for several years, in an Aviary 28 feet long, 9 feet wide, and 12 feet high, divided, however, into two parts, for the following reasons:—I found that the class of birds named Sylviadæ, or soft-billed, were not destructive to flowers, trees, or plants, beyond occasionally soiling them, which is easily remedied by frequent ablutions, and that their food differed from the other class Fringillidæ, &c., or hard-billed, which are destructive to every living plant, and for which dry twigs or a leafless tree served as perches. I will enumerate those I have been in the habit of keeping together in each separate division.

Sylviadæ.		
Nightingale	Redbreast	Fieldfare
Black Cap	Long-tailed Tit.	Redwing
Garden Warbler		Song Thrush
Hedge Sparrow	Fringillidæ.[a]	Blackbird
Comm. Whitethroat	Chaffinch	Starling
Lesser Whitethroat	Goldfinch	Large spotted Woodpecker
Redstart	Greenfinch	Green Woodpecker
Stonechat	House Sparrow	Nuthatch
Whinchat	Tree Sparrow	Jay
Wheatear	Bullfinch	Lapwing
Pied Wagtail	Linnet	Barbary Dove
Grey Wagtail	Averdevine	Turtle Dove
Yellow Wagtail	Redpole	Wood Pigeon
Willow Wren	Hawfinch	Blue Tit
Sedge Warbler	Bramblefinch	Cole Tit
Woodlark	Canaries	Marsh Tit
Titlark	Twite	Water Hen
Skylark	Crossbill	Partridges
Meadow Pipit	Blk.-headed Bunting	Pheasants
Snipe	Common Bunting	Quails
Common Wren	Yellow Bunting	Water Rails, and
Spotted Flycatcher	Cirl Bunting	Kingfishers.
	Missel Thrush	

Should "M. E." wish further information, I shall be happy to communicate with him, by his addressing me to that effect.—*W. Rayner, Surgeon, Uxbridge.*——Another correspondent writes thus "you may put into your aviary 6 cock and about 12 hen canaries—the cocks rich, and the hens mealy. You may add two or three goldfinches, linnets, yellowhammers, chaffinches, or siskins;[a] but these should be all cocks, in which case you may have some mules. Feed only on the best canary and rape-seed, three parts to one. Give fresh groundsel, as seedy as you can get it. Boil an egg hard, and cut it in two. Bread is quite unnecessary, even when you have young birds. Fresh clean water in a flower-pan, about seven inches over, every day. Your seed may conveniently be put into a tin receptacle, called "a witch." No growing shrubs or plants can be kept in the aviary; but thick boughs may be fixed up, either with or without boxes or baskets, for the nests. To enable them to construct these, you cannot supply them with anything better than fine sweet hay. If the aviary is open to the sun, you will be much better without any additional source of heat. I have now canaries building in an open aviary. You may add skylarks, and the song-thrush; not the blackbird; but in this case you must give hemp-seed and bread-crumbs. You may, instead of the seed-birds, put in soft billed birds, such as the nightingale, blackcap, whitethroat, &c.; but the two sorts seldom do well together, and the latter are much the most precarious and troublesome. These observations are the results of some years' experience.—*Corylus.*

[a] Hedge-accentor, reed-sparrow, and greenfinch.

Mr. Loudon.—A paragraph having appeared in several of the newspapers, stating that above a thousand pounds had been subscribed for poor Mr. Loudon's books, since his much lamented death, many of our friends have supposed that Mr. Loudon's family are now free from all pecuniary difficulties. This, however, is far from being the case; for though it is quite true that the large sum alluded to has been collected (and the greater part of it in the short space of six weeks, since the first advertisement on our behalf appeared in the *Gardeners' Chronicle*), yet more than half the original debt is still owing, and till the whole of it is paid, Mr. Loudon's family cannot derive the slightest benefit from his copyrights. I am anxious that this should be known, in order that our friends may be aware of the important service they will still do us by ordering copies of poor Mr. Loudon's "Arboretum," or any of the other works which were his own property; and I cannot conclude without expressing my warmest gratitude for the kindness we have already experienced. It is, indeed, only when we are in trouble, that we find how much real goodness there is in the world.—*J. W. Loudon, Bayswater.* [We understand that his Royal Highness the Duke of Cambridge has kindly expressed his intentions to become a purchaser of the "Arboretum Britannicum," and that a meeting in behalf of Mrs. Loudon has lately been held in Edinburgh, which promises to be attended with successful results.]

The Heckfield Melon-pit.—In this pit, as described and alluded to in former Nos. of this Paper (p. 892, 1843, and p. 54, 1844,) the front and back walls have been considered as unbroken, and, therefore, as cutting off all direct communication between the linings and the interior of the pit. The effect of the linings was limited, therefore, to heating the cavities in the front and back walls, through which the circulating air was made to pass, and no means of access to the litter within the pit existed, except through the bed on which the plants were growing. It has been thought, therefore, that all the benefits of the original contrivance might be retained, and the inconveniences in question be removed by building the front and back supports as detached hollow piers, having communicating drains at bottom, as shown by the dotted lines, through which the air may circulate, as proposed by Mr. Berry.

The plan is fully explained in the annexed figure, and it will doubtless be considered as an improvement on the former arrangement.—*A.*

Joints of Hot-water Pipes.—In our last Number, we recommended the use of old rope-yarn for making these joints. We are since informed that when the rope has been much saturated with tar, this material melts out with the heat, and sometimes leaves the joints imperfect. It is, nevertheless, very much employed; but new or at least untarred yarn is better, where the permanence of the joints is greatly desired.

Wash for Fruit-trees.—You constantly recommend that Fruit-trees should be done over with lime as a wash. Nothing can look more frightful than their glaring conspicuous trunks on a hot summer's day; and to obviate this dissight I use cow-dung, soot, or wood-ashes, mixed up with urine, the drainage of a dung-mix, or ammonical water from the gas-works, to the consistency of thin paint. This composition appears to me to possess all the advantages of the lime, and the trunks of the trees appear lessened, and altogether much more pleasing to the eye.—*J. C. S.*

Bees.—In answer to a "Constant Reader," I beg to state that the period of the year when artificial swarming is resorted to, is from the beginning of May to the middle of July, or as soon as the stock-hives are full of Bees. In order to ascertain when hives are ready, it is necessary to blow a little smoke into them, then lift them up and look how many Bees are on the boards. If there should be as many as will fill a 32 or 24-sized flower-pot on each board, it is time to take off swarms. In 99 cases out of 100 the queens run up into the empty hives, but it is advisable to ascertain that they are with the swarms before they are put into the hives, which are prepared with sticks and combs to receive them. The swarms would be drummed into these hives at once, if the sticks and combs did not make it more difficult to see the queens. When swarms are drummed into empty hives the queens are easily seen, for the Bees fall to the crowns of the hives, when they are inverted, and then run up the sides. If the queens are not seen within the space of two minutes from the time the hives were inverted, the Bees must be put on the crowns of the hives with spoons. If it happen that a queen has not left the stock-hive, drum her and a few Bees into the sticked-hive, and throw the swarm in beside them. On the 17th or 18th day afterwards, second swarms will issue from the stock-hives, and on the 21st day all the brood, but a few drones, being 24 days in their cells, will be hatched, on the evening of which day all the Bees are drummed into empty hives. Thus we obtain three swarms and a pound's worth of honey at an early season, from every stock-hive. If a pound's worth of honey cannot be thus obtained, it is better not to drum the swarms out. Instead of taking the honey out of these hives after the Bees are drummed out of them, it is often more profitable to put them in a garret till September, when two swarms ought to be put into each. The honey is simply squeezed or allowed to drop out of the comb.—*A. Pettigrew.*

Grafting.—As this is the proper time for grafting, I beg to subjoin a list of plants the most difficult to take, but which will invariably succeed, if, in addition to clay-ing, they are moulded up to within a bud of the scion; to admit of which, the stock must be cut very low, as near the ground as possible, the earth drawn up in a pyramidal form round the plant:—

Willows.	Mistletoe on Apples.	Laburnums.
Ligustrums.	Cotoneaster on Thorns, &c.	Ash.
Euonymus.	Roses.	Vines.
Chinese Cherries.	Acacias.	Azaleas.
Pinuses.	Elms.	Rhododendrons.
Daphnes.	Poplars.	Andromedas.
Evergreen Oaks.	Chesnuts.	Kalmias.
Loniceras.	Limes.	Lilacs.
Jasminums.	Almonds.	Deutzias.
Pears on Quinces.	Cytisus.	Arbutus.
Pears on Thorns.	Sorbus.	Phillyreas.
Laurel on Cherries.	Currants.	Caraganas and
Mespilus canadensis.	Hollies.	Ribes.
Pyrus spectabilis.		

—*Union.*

Solandra grandiflora.—Among the many plants that adorn the conservatory with blossoms at this season, few are more showy than is Solandra grandiflora; and as this plant in many places does not bloom freely, I shall give my method of flowering it: After it attains to the height of from 3 to 5 feet, I do not shift it, but it is allowed to remain in as small a pot as it will grow in until the roots become matted round the outside of the ball; this, in some measure checking over-luxuriance, without injuring much the constitutional vigour of the plant, gives it a disposition to bloom. Early in autumn it is kept in a cool situation, and allowed to become perfectly dry, when the leaves will drop off. About the beginning of November it is introduced into heat, and forced gently, supplying it plentifully with water when it begins to grow. Being thus excited for a short time, the plant grows freely and produces blossom-buds on the young wood, and at the end of each shoot, these in January and February, expanding into large Magnolia-like flowers, have a gay and imposing effect. As soon as it has done flowering, which is generally in March, the shoots are cut back, and the plant, being shifted, is put into heat, and encouraged to grow, stopping the young shoots frequently, to induce it to throw out laterals, and to keep it dwarf. By this treatment it very often forms spurs similar to a Pear or Apple-tree, at the ends of which, after allowing the roots to become matted in the pot, giving it a rest, and keeping it dry and cool from August till November, blossoms are produced in abundance upon its being put again into heat, and excited into growth.—*J. Brown, Whittlebury Lodge Garden, Towcester.*

Hops.—Will any scientific reader be kind enough to inform me whether the Hops are a necessary ingredient either for yeast or for making beer keep? Or are they merely useful for flavouring? Have they really, when thus applied, any antiseptic virtue? If they have, why will not a strong decoction keep for any length of time in a Chemist's shop? If they are of any use in keeping beer, it must be in checking the tendency to fermentation; and if so, would they not be better left out in making yeast?—*J. B. K. L.*

Miscellaneous.—*Nova* states that Heath has been long used for edgings in the gardens of the Lord Great Chamberlain, where it is much admired during summer and autumn. In 1840 and 1841 about 1000 yards were laid, and most of the old edging was renewed, the soil was taken out eight inches wide and eight inches deep, and the trench filled up with bog-earth. Into this the heath was planted firmly four inches broad; it is cut square every spring. Planted and managed in this way it will stand for 10 years without being renewed, and if it is cut twice in the year it will stand longer. It should be planted in spring.——*A Correspondent* states that he has tried Humphreys's compound with success on several Hyacinths this year, and also on several sorts that would not hitherto root in water. This season they have rooted very freely and strongly; the whole of the blossoms are considerably larger and more beautiful; the foliage is dwarf and waxy. ——*Wax* inquires if any of our correspondents can inform him where he can purchase or see one of "Wildman's mahogany hives." —— *M. P. E.* suggests that

the culture of Trapa bicornis might be attempted in the open air with success, as it is grown in abundance in the cold climate of Cashmere, where it forms an important article of food, as related by Baron Von Hugel in his Travels.——*J. Webster* observes, that for Orchidaceous plants, where fibrous peat is scarce, an excellent substitute is to be found in woods, where leaves, sticks, &c., have accumulated and become a mass of fibrous roots. This material is lifted with a spade, about the thickness and in the same way that turf is lifted, and is again cut into smaller pieces when it is used.——*R. S. D.* informs us that being obliged to form a cut through an old meadow which had been drained some 13 years ago with spray or brushings of Spruce and Scotch Firs, he found the drains were running well. He states, that to his astonishment, soon after exposure to the air the Firs budded freely.

Societies.

HORTICULTURAL SOCIETY.

SIR C. LEMON, Bart., M.P., in the chair. Mr. Wm. Cock, Jun., was elected a Fellow of the Society. Mr. Cockburn, gardener to the Earl of Mansfield, at Kenwood, sent bulbs of Oxalis Deppei for the purpose of being distributed. A smaller, and in every respect an inferior kind to this, is generally cultivated for it, which is no doubt one reason why this root is not more in use for culinary purposes. In Belgium it is extensively grown, where not only the tubers but the leaves are also made use of. Respecting its culture Mr. Cockburn says, "I have grown it for several years, and I am convinced that if a little attention is paid to its cultivation it will be found very useful in the months of October, November, and December; but it would require a longer season of fine weather than our climate affords to bring its tubers to perfect maturity. The bulbs should be potted as early in spring as circumstances will permit, and as they vegetate in a low temperature the pots may be placed in a Peachhouse, greenhouse, or even in a cold frame: but they must not be turned out of doors until all danger of frost is over. They thrive best in a light sandy soil in a southern exposure; the bulbs may be planted from 9 to 12 inches apart each way, and should be so arranged that they may be protected from the early frosts of October and November by a slight covering of straw, mats, or spare lights. As 8 or 10 good tubers are sufficient for a dish, there may be 2 or 3 dishes a week for 3 or 4 months, which is no small acquisition to a gardener who has a family at that season to supply with vegetables. Along with these Mr. Cockburn sent for exhibition a tall well-grown specimen of Correæa Harrisii, for which a certificate was awarded.—From Mr. Robertson, gardener to Mrs. Lawrence, was a collection of plants, containing handsome specimens of Epidendrum rhizophorum, a rather scarce plant, remarkable for its bright orange-red blossoms; Illicium religiosum, a hardy greenhouse plant with pale green flowers, and somewhat resembling a Spurge Laurel in appearance; Dendrobium secundum, with handsome small racemes of purple flowers; a tall plant of the old Cyrtopodium Andersonii, in excellent condition; also Batemannia Colleyi, Schomburgkia violacea, a good specimen of Cyrtochilum maculatum remarkable for its fragrance, an Amaryllis and 5 pretty plants of Epacris, viz. E. impressa, variabilis, nivalis, attenuata rubra, and a variety of impressa. A Knightian medal was awarded for the first 4 plants.—Mr. Graves, gardener to Mrs. Cannon, sent a bloom of an Epiphyllum from Brazil, which was not different from E. violaceum.—From C. B. Warner, Esq., was Camarotis purpurea, an East Indian species, having gracefully drooping racemes of purple blossoms, and a large flowered variety of Lycaste Skinneri that was imported late last autumn; the bulbs were at first placed in an Orange-house, and were not exposed to the sun until after roots were formed. The plant was then removed to the cool Orchidaceous-house, where it has since been growing; a certificate was awarded for the former.—Mr. Plant, gardener to J. H. Schroder, Esq., sent Vanda cristata, singular on account of the curious form of its flowers; and Oncidium bicornutum having a fine spike of dingy yellow blossoms: a certificate was awarded for the Vanda cristata.—From Mr. Jackson, of Kingston, was a large specimen of Erica Cushiniana with small purple blossoms; and Morina longiflora, a scarce herbaceous plant, which will grow out of doors, but does better to be kept in a cool frame or in a greenhouse, where, if it is well grown, it produces a stem 2½ft. high, which, when covered with bright crimson blossoms, is rather a striking object.—Mr. Crawford, gardener to Mrs. Arabin, sent a cut specimen of Solandra grandiflora, a beautiful hothouse shrub, having large showy white bell-shaped flowers. It was introduced from the West Indies a great many years ago, but on account of the difficulty found in blooming it, it is not generally cultivated.—From Mr. Doran, gardener to T. Hawes, Esq., was a brace of straight, well-formed Cucumbers, measuring 19 ins. in length: a certificate was awarded for them.—From the garden of the Society was a collection of plants, comprising Oncidium ampliatum, both the small and large variety; they were sent from Guatemala by Mr. Hartweg, and are both one species, but differ in the size of the flowers, the one being much larger than the other. It is one of the many instances in which Orchidaceæ differ in this respect; it seems to be a general disposition among them, for plants of the same species to produce flowers different in size, while in other respects they are not dissimilar. In the same collection were likewise Dendrobium Heyneanum, Epidendrum Stamfordianum, Lycaste cruenta, Franciscea Hopeana, Euphorbia melanthera, and three Cinerarias, viz. Fanny Tripet, Urania, and Unique; the first had been drained with charcoal, the second had been top-dressed with the same material, and the third, besides being top-dressed with charcoal, received one teaspoonful of Harris's liquid manure in a pint of water, on the 5th of February. With these differences, the plants were treated in every respect the same. The first was the smallest, and the leaves were of a pale yellow green; the second was larger, and the foliage was of a deeper shade; the third, being the one that had received the liquid manure, in addition to the top-dressing of charcoal, was the largest, and the leaves were of a very healthy dark green; but that this results from the use of the liquid manure is not perfectly ascertained. Along with these were cut flowers of Camellia Colvillii, imbricata, and Reevesiana; and also of Acacia pubescens, and Riceana. The following cuttings of Pears were distributed:—Comte de Lamy, a Belgian variety, middle-sized, very sugary and rich, and in perfection in October, Thompson's, also of Belgian origin; it was received from Dr. Van Mons; and although it possesses great excellence, it has not yet been discovered among the more recent importations of new varieties from the Continent, received with names; it is by many esteemed the richest Pear of its season, which is November. Winter Crassane, one of Mr. Knight's varieties; it is an abundant bearer, as a standard quite hardy, of the form and size of the Crassane, with its flavour and less grittiness: it comes into use in December or January. Althorp Crassane, also raised by Mr. Knight, and hardy like the preceding: specimens of it have been found of excellent flavour, although grown in a much worse climate than that of London.

LINNÆAN SOCIETY.

Mar. 19.—EDWARD FORSTER, Esq., in the chair.—Thomas Bridges, Esq., was elected a Fellow. A collection of fruits was exhibited, presented to the Society's collection, by John Reeves, Esq.—A spurless variety of Tropæolum was exhibited by Mr. Hugh Low.—A paper was read from George Newport, Esq., on the structure and classification of the class Myriapoda. The author stated that this class had received less attention than any other belonging to the animal kingdom. Dr. Leach had left materials at the British Museum for their further study, of which the author had availed himself. This class was placed by many systematists with the insects; but they differed from the true insects in many respects. They were more like the larvæ of insects. They differed from insects in being born with a small number of segments, which go on increasing and lengthening the body of the animal, till it has attained maturity. Insects always have the same number of segments. In true insects the legs are only six in number; but in the Myriapods, each segment is furnished with several legs, and in some species they amount to 160 in number. The Myriapoda were not more nearly allied to the Crustacea and Arachnida, but there were species pointing out an affinity with each of these classes. In arranging the Articulated classes, the author considered this group ought to be placed next the Vertebrate division, and he placed the insects at the top of the Articulated classes. He did so on account of the larger developments of the supræsophageal ganglion in this class, which must be looked upon as the representative of the brain in the vertebrate classes, and which accounted for the superior instincts and intelligence which those animals exhibit. In the arrangement of the whole group, he should not take alone the digestive apparatus as his guide, but the skin, the organs of locomotion, and the nervous system, as it was on these organs that the functions of animals depended, which most clearly distinguished them from the vegetable kingdom.

Reviews.

A Treatise on the Cultivation of the Pine-apple, &c. &c. By Joseph Hamilton, Gardener to F. A. Philips, Esq. 12mo. Masters.

THE author of this book is the grower of the large Thornfield Pines, mentioned at p. 861 of our Journal for 1843, and on previous occasions. He is, therefore, a man of authority, and his method of cultivation will be read with interest.

The weight of Pines grown by him is stated by himself (p. 93) to be as follows:—"The Montserrat has been frequently cut here, from 6lb. to 7lb.; 20 Montserrats have been cut the last two years, viz, 1841 and 1842, which in all weighed 104lb., the largest of which was 7lb. 4oz., all out of one house. The Black Jamaica generally speaking runs rather larger. The majority of the Envilles cut at this place vary from 7 to nearly 9 lbs."

And he adds, that in his opinion—"A Queen of 5lbs. is equal to a Montserrat, 5 lbs. 4 oz., Black Jamaica, 5 lbs. 8 oz., Enville, 7 lbs., White Providence, 11 lbs.;" long experience having taught him, that to grow the above varieties to the weight specified above, deserves equal merit. These things will enable the reader to judge in some measure of Mr. Hamilton's skill.

The first fifty-seven pages consist of a brief and useful sketch of the plans of Pine Growing employed by former gardeners, from Telend up to Marsland; but, strange to say, not a word is said of Mr. Glendinning's, which is the best of them all; nor of Mr. Barnes's, published in the January Number of the "Gardeners' Magazine," and which might have been introduced into a note at the end of the work. Mr. Hamilton next sets forth his own mode of proceeding, which occupies forty-five pages. The main points on which his practice seems to depend are: 1st, Fruiting the suckers of old stools; 2d, Turning his successions out of their pots into a tan-bed, in which they fruit, and through which their roots find their way without let or hindrance; and, 3d, Watering the plants overhead. His mode of proceeding with suckers is stated at considerable length. We can only make a few extracts:—

"The plant being ready for its last shift, I commence by putting two or three inches of broken Oyster-shells, mixed with a little bone-dust, at the bottom of the pot as drainage; on this I place a covering of half-decomposed turf, and then turn the plant carefully out of its pot, re-removing a little of the soil from the bottom of the ball, in order to have it a good depth in the pot, so as to allow room for soiling up after the first fruit has been cut.—I am quite convinced of the superiority of earthing up, over that of transplanting into larger pots, after the fruit has been cut. I have frequently tried the latter as an experiment, and invariably found the plant to be from two to four months longer in fruiting, and the fruit also to be much inferior in size.—The plants after earthing up will commence growing immediately, and new roots will be thrown out from the bare trunk into the fresh soil.—By attention to watering, moist atmosphere, &c., the suckers will grow rapidly, and perfect their second fruit, generally speaking, in from eight to twelve months from the time the first was cut.—With me it invariably happens that all the varieties of the Pine that I have cultivated, except the White Providence, have one sucker or more in progression, whilst the plant is swelling its fruit; in such cases one only ought to remain, the others should be destroyed as they appear, except the cultivator prefers quantity to quality.—After the fourth fruit has been perfected, I then cut off the sucker which produced the last fruit, with from six to eight inches of the old trunk attached to its bottom. The leaves are all dressed off that portion of the detached trunk, and from the bottom of the sucker, which will have made a quantity of roots in the axil of the leaf of the detached trunk, is then planted into a pot, nine or ten inches diameter at the top, placing the attached trunk at the bottom of the pot, before the drainage is put in, in order that the sucker may be sufficiently deep to be covered with the soil.—It must be observed that by the practice of planting a portion of the old trunk, with the sucker, although the former when first planted, has frequently no roots, it undoubtedly assists in supporting the sucker until it has made roots of its own; and this I ascribe to the sap or juices already deposited in the trunk, which are very probably set in motion by the chemical agency of the soil. The plant being a succulent one, is capable of holding in reserve its accumulated food in a fluid state, for a great length of time, and particularly if screened from the powerful rays of the sun."

The method first employed in turning the succession plants out into the tan-bed is thus described:—

"On February 26th, 1828, I planted 48 Pine-plants in the tan-bed, all of which, except one, fruited the same year. The process which I adopted was as follows:—The pit in which they were grown was 27 ft. long, by 10 ft. wide inside; two feet of which were occupied by the flues and cavities, which left a width of 4 ft. for the tan-bed. After all the plants were taken out of the bed, the old tan was levelled, well trodden down, and smoothed with the rake; the whole bed was then covered with fresh tan to the depth of 10 inches; the plants were then immediately turned out of their pots, with their balls as entire as possible, and plunged into the bed; they were then beaten tightly about the ball, and covered to the depth of one inch only. It will be necessary here to observe, that if the ball, with the roots, be covered too deeply, they will be in danger of being burned. The tan used for this mode of culture must be made from British bark, as it undergoes a slower putrid fermentation than foreign tan; and I have always found that as it decays it is rendered less fit for supplying the plants with food. I have tried planting in old decayed tan, but the plants made very little progress: the fruit also was of inferior size. Foreign tan is objectionable, as it soon decays."

Afterwards it underwent some variations.

"Thinking, however, a great improvement might be made in this method of planting out into the tan, I tried the following experiment, which fully answered my expectations:—At the time the plants were showing fruit, I added two or three inches of fresh tan all over the roots of twenty, beating it down with the spade, and the beneficial result was seen in the swelling of their fruit. By the time this was cut, the suckers then growing on all the plants were of a prodigious size, and had I then known the value of their produce, by letting them remain attached to the old stools, their second fruit might have been ripened by the following October."

The reason why tan is found a better plunging material than anything else, is, in Mr. Hamilton's opinion, its warmness; for he found that the best kind of compost was too cold. And this we quite believe. But we should like to know whether tan would be found better than rich soil, if bottom-heat were supplied by hot-water gutters. We should expect it would *not*.

Upon the importance of watering overhead with *warm* water, Mr. Hamilton much insists. Indeed, he also keeps the atmosphere damper than is usually thought necessary. At page 65 he says—"I only water the plants over their leaves in the evening, at the time of closing the house, which ought to be done whilst the sun is still shining on the glass, before its rays are much diminished, thus causing the heated particles of the water, which have been sprinkled inside the house, to convert the superincumbent atmosphere into a state of humidity, which being inhaled by the respiratory organs, into the assimilating system, will assist the plant to promote those secretions indispensably necessary in maintaining it in health and vigour. It is also of much importance that the atmosphere be kept moist during the day, by throwing plenty of water in the alleys and other vacuities; the humidity arising therefrom will be absorbed by the plants, and thus the respiration and perspiration of fluids being perpetuated day and night, will

tend greatly to keep the plant in a vigorous growing state." And in another place he writes thus—"My motive for supplying the plant with a sufficiency of water, by syringing over the leaves, is twofold; first, I believe the epidermis of the Pine to be very porous, and therefore capable of absorbing a great quantity of its food by that process. Thus I syringe with tepid water," &c.

In this practice of pouring water on the leaves, we have no doubt that Mr. H. is right—*at certain seasons*—that is to say, when the plants are growing fast; for that is what naturally happens to them, and what the peculiar arrangement of their leaves is manifestly intended for. But we greatly fear that it will have a bad effect upon the *quality* of the fruit, if followed up after the blossoms are withered and swelling begins. At that period, Nature gives the Pine-apple a hot and dry atmosphere, which is doubtless required to bring out its rich secretions; and all the moisture it obtains is from the soil.

We should like to hear, from disinterested persons, what the *quality*, that is flavour, of the Thornfield Pines has really proved to be. In the meanwhile, we reserve some more special remarks on Mr. Hamilton's work for another opportunity.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

ARCTOSTAPHYLOS PUNGENS. Pungent Bearberry. (*Evergreen Shrub.*) Ericaceæ. Decandria Monogynia.—This seems to be a common Mexican shrub, for it occurs in most collections from that country. In appearance it is extremely like Arctostaphylos tomentosa, and an insufficient examination of dried specimens led to the belief that it is a mere variety of that plant. The fresh specimens show, however, that in addition to a want of the long beard-like hairs of the branches of A. tomentosa, this species has the awns of the anthers longer than the anthers themselves, and only seven cells to the ovary instead of ten. It was introduced to the garden of the Horticultural Society by Mr. Hartweg, who found it in Mexico, at an elevation of 7000 to 9000 feet above the sea, forming an evergreen shrub six to eight feet high, with a reddish brown smooth stem and branches, and very hard wood. It was common about Guanaxuato, Real del Monte, Bolanos, and Oaxaca, and is known there under the name of "Pinguica" or "Manzanilla," according to that Botanist. Up to the present time it has proved, in cultivation, to be a neat little half-hardy or possibly hardy evergreen shrub, growing two or three feet high. But it is one of those uncertain plants which will die suddenly during the hot weather in July and August, especially after a few hours' rain, if planted in the open border, although it may have been previously in the highest state of health and vigour. Mr. Gordon, who has had the management of it in the garden of the Horticultural Society, has given us the following note concerning its management:—"It seldom can be kept alive for more than two or three seasons after being raised from seeds, even in pots, unless treated in the following manner:—The seeds should be sown in pans, filled with a mixture of peat and loam, to which should be added a small portion of decomposed cow-dung, and placed in a close pit or frame. They soon come up if sown in the spring or summer, but if sown late in the autumn the seeds lie in the soil until the following spring before they vegetate. When up, and before they make a rough leaf, prick them off into a fresh pan filled with the same kind of soil as that in which the seed was sown. Afterwards keep them shut up close and well shaded, and finally pot them off singly when they have made three or four proper leaves, giving them at once a shift into larger pots, and return them to the frame, which should now have the back turned to the sun, and be kept close for a few weeks; air not being given at any time until the plants are fairly started and growing again. Afterwards remove the lights entirely during the night time, and keep them on quite close in the day, during the summer and autumn. When the nights become wet and frosty, remove the plants to a cold pit for the winter, where there is plenty of light and air and no damp."—*Botanical Register.*

BERBERIS PALLIDA. Pale Ash-leaved Berberry. (*Evergreen Shrub.*) Berberaceæ. Hexandria Monogynia.—To the pinnated, or Ash-leaved, Berberries, formerly miscalled Mahonias, Mr. Hartweg has been able to add seven new Mexican species, among which is the plant now described. In its native country it forms an evergreen shrub from five to six feet high, and is found but sparingly near Cardonal and Zimapan, on mountains thinly covered with Pinus Llaveana. Mr. Hartweg also met with it near the hot springs of Atotonilco El Grande, but nowhere in any quantity. That gentleman informs us that it is easily distinguished by its dry hard leaves, and pale yellow flowers; and that the wood is also of a lighter colour than in any other species. In our gardens its appearance is vastly improved, and it will probably prove as handsome as others. It grows freely when potted in a mixture of sandy loam and leaf-mould, to which is added a small portion of rough bone-dust. Being at present extremely rare, it has not been tried in the open border; but the appearance of the plant leads us to suppose that it may be at least as hardy as B. fascicularis. Up to the present time, in the garden of the Horticultural Society, it has been kept in a cold pit. It may be increased like the other pinnated kinds, by grafting on the common B. aquifolium either in spring or autumn, when the young shoots are nearly hard; but hitherto the plant has not shown the least disposition to make any lateral shoots, although three feet high. It will, no doubt, be increased hereafter by seeds, which are likely to be produced freely when the plants get older; as yet the Berries have had no seeds in them. It flowers during the months of January and February, if kept in the greenhouse, and in July ripens its long erect spikes of deep purple Berries.—*Botanical Register.*

Miscellaneous.

*Propagation of Plants by Circumposition.**—The following mode is practised by M. Fonlup, at Mont-Brison. He procures a quantity of small tin cases of a conical form, like the upper part of a funnel, $2\frac{3}{4}$ inches in length, and $2\frac{1}{8}$ inches wide at top, narrowing towards the lower part till only sufficient room is left for the introduction of the shoot or branch intended to be propagated. These cones are supported on rods, to which they are secured by wire. Commencing with the central branches, the leaves are taken from the parts which the tin is intended to inclose. The branch is cut two-thirds through, as in layering; and being inclosed by the funnel the latter is well packed with moss. Moisture, necessary for favouring the emission of roots, is supplied by means of a bottle from which the bottom is struck off and the neck furnished with a cork, perforated so as to admit a small pigeon's feather or bit of wool, to form a syphon, by means of which the moss is kept in a proper state of moisture. The plants on which the operation is made are placed so as to be partially shaded by trees during the first month. Hard-wooded plants are propagated in this way from the middle of May till the end of June; and the branches are sufficiently rooted to be taken off by the end of September. Soft-wooded plants may be operated upon in March, and the plants taken off in June, or in the end of June and beginning of July, in which case the plants may be taken off, if sufficiently rooted, in the end of September. It is, however, necessary, in all cases, to ascertain whether the branches are sufficiently rooted previously to their being separated. This is easily done by opening up the edges of the tin. When the branches are found to be sufficiently rooted they are potted off without removing the Moss by which the roots are surrounded. Being moderately watered, they are immediately placed under glass, on a slight hotbed, and kept shut up for a fortnight. They are then gradually exposed, and afterwards placed in the shade of large trees, so that only half the rays of the sun shall reach them. In this manner M. Fonlup obtained from one stool of Pittosporum sinense, 52 well-rooted plants in the short space of two months, by means of 30 tin cones. He also employs the latter for invigorating weak branches, and for increasing the size of fruits.—*Revue Horticole, for Sept.*, 1843. ||

M'Nab Testimonial.—At a dinner lately given to Mr. M'Nab, the following articles were presented as the result of the late subscriptions, viz., a silver snuff-box enclosing a draft for 400*l.*, on the Edinburgh and Glasgow Bank; also another snuff-box fashioned like a Scotch Thistle, and formed out of the root of a Scottish Bamboo, grown by Mr. M'Nab in the Botanic Garden; and it was stated that the cane from which it was taken grew to the height of 40 ft, in the short space of six months. A silver salver, silver divider, and silver sugar-basin were likewise presented to Mrs. M'Nab, and a work-box bearing an inscription was given to Miss M'Nab, who has drawn a well executed portrait of her father, which is to be given to every subscriber.

African Guano.—We lately announced the arrival of African guano at Liverpool. We are now enabled, by the kindness of a friend, to give its analysis, as obtained by Mr. Huson of Liverpool.

Guano from Ichaboe, Western Africa.

Moisture (water)	16·5
Free Ammonia	6·5
Ammoniacal salts, chiefly urate and phosphate of ammonia	52
Carbonate of lime	6
Organic (animal) matter, with phosphate of lime, traces of oxide of iron, and an inappreciable amount of silica	19
	100

[If this analysis is correct, there can be no doubt that the substance is of great value.]

Hamburgh Botanical Garden.—The friends of Mr. Edward Otto, son of the botanical veteran, will be glad to learn that he has been appointed Superintendent of the Hamburgh Botanical Garden, an establishment provided by the government of that republic, for the use of students and lovers of our science. Mr. Otto will assume his office in the middle of next month, and it is, as he writes to correspondents, his wish and hope to keep up an active and useful intercourse with his many friends on this side of the water.

CALENDAR OF OPERATIONS
For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

PROPAGATION and potting will occupy the greater portion of the time here for the next six weeks; attention must also now be directed to training and regulating the young growths of climbers and other free-growing plants. Newly potted plants do not want much water until they are more established in the fresh soil; bulbs of the Amaryllis tribe brought in for forcing may be potted, if they require it, when their leaves are half grown, but never pot them when they are at rest; the heat and moisture may be the same as recommended for the last few weeks.

Conservatory.—The temptation to collect all plants in flower into this house being great, you may be led into error, by crowding them too much at this early season; crowding plants in winter is a matter of necessity, and when the plants are in a dormant state this is of less consequence, but now that they are in active growth, unless they have room to admit light and air among them, they soon spindle up out of all shape and proportion; except on fine days, little air is necessary for this house in March, and might prove very injurious to tender flowers. Camellia blossoms are as soon affected as any by cold currents; damp the paths in the evening, and light gentle fires at night while the weather keeps cold, and do not let the temperature get below 40° for the season.

Greenhouse.—The great facility and economy of heating ranges of pits now, and the superior manner in which plants grow in such pits, will do away with greenhouses altogether in a few years; this will make a great improvement in small places, where all the plants are now packed together in a neat little greenhouse, and where many of them die yearly, under the greatest care that can be given them; such little greenhouses will then be devoted to plants in flower only, except perhaps a few good specimen plants in winter. In the meantime keep this house as cool as possible—our nights are too long yet, and we have too little sun to preserve early growths properly; great attention is necessary in watering here now, as the plants soon get dry in fine weather.

Forcing-pits.—Bulbs of the Amaryllis tribe, or other kinds brought in for forcing, often make fine large leaves, but show no blossom, and on that account any out of the way place is thought good enough for them afterwards; but the less these are disposed to bloom the more care is necessary to cultivate them, to expose their leaves as much as possible to the light, to see that they have neither too much or little water, and that their pots are well drained; turfy loam, with a little leaf-mould and sand, suits a great many of these; peat is injurious to some of the more delicate sorts of them, while the most tender of the Iridaceæ will live only in light peat. Always keep up a good moist growing heat, of from 60° to 80° in these pits from this time, and smoke them as soon and as often as the fly appears, but avoid strong doses; better do it often and give a little at a time.—*D. B.*

II.—FLOWER-GARDEN AND SHRUBBERIES.
Out-door Department.

IF the directions of former Calendars relative to seed-sowing have been attended to, it will not be necessary to sow any more at present; but if not, a general collection must be got in without delay. The last few days, though they have been piercingly cold, have been favourable for the performance of out-door operations, and though the ground is in tolerable good condition, it will not be advisable to use the rake much on the beds until the end of the month. It will, however, be well on heavy land, to hoe it deeply, so as to get as great a depth as possible in a free pulverised state prior to planting out the half-hardy plants. Recently-transplanted annuals will suffer much during these parching winds, if they are not protected by a few branches or some other contrivance. Ply the broom and roller vigilantly, both on the lawns and walks, and above all things get the Grass cut well into the "bottom" before the middle of next month, or you will be troubled with it throughout the season. Snowdrops are now on the wane, therefore remove the flowers, and strengthen the bloom for another season. These simple things, though they take good care of themselves, are not unworthy of a little cultivation.

Rockwork.—This, where it is covered with plants, is one of the most difficult things in the garden to manage, without the plants being destroyed on the one hand, or a character of stiff formality imparted to it on the other. In regulating the plants avoid everything like formality, and while you keep each plant in due bounds, do not, if you can possibly avoid it, distort the symmetry of Nature. A little fresh peat or leaf-mould may be added as a top-dressing to the more choice of the Alpine plants, and a few seeds of trailing annuals may be sown in any vacant places.

Pits and Frames.—Many of the established and more hardy plants in these structures may now be removed to temporary pits to make room for the spring-struck stock, which are now being daily potted off. Some judicious remarks on this subject were offered by Mr. Errington three weeks back, which, though they do not accord with the practice of the best metropolitan cultivators, are nevertheless worthy of consideration. For my own part I imagine that plants should not be kept in a perfectly shaded situation from this time until June, merely because it happens to be good treatment for them from November until March, when they ought to be in a perfectly dormant state. My practice, which extends to upwards of 20,000 plants annually, is to get the plants growing as soon as the natural season will induce them to do so, so as to get rid of that rusty appearance which is always attendant upon plants that have been shaded for a few weeks after they are first planted out. Proceed with potting off, and do not permit any vacant space in the propagating frame until you have more plants than you require for bedding out.—*W. P. A.*

III.—FLORISTS' FLOWERS.

THE boisterous winds of March are anything but congenial to Florists' Flowers; and the frosts that we may constantly expect, must be guarded against with redoubled care; for every Florist knows that more havoc is made amongst their collections during the present month, than at any period of the year. The Auricula is very susceptible of cold when expanding its blossoms; and, should the temperature of the frame get too low, it is with the greatest difficulty (and with some sorts wholly impossible), that they are enabled to bloom. The crop or stock of Carnation layers is much below the average, many growers complaining sadly of the loss they have sustained. When the nights are likely to be fine, the frames ought to be left open, so that the plants may be hardened preparatory to their removal into blooming pots. Very few Ranunculuses ought now to be out of the ground. Seed may still be sown with success. *Pinks* appear to have been rather affected by the late winds; all cracks in the bed must be closed, and the plants looked over after frosts, and fastened. *Polyanthuses* are rapidly growing; care must be taken to trap snails and other insects injurious to the forthcoming blossoms. Under this head we may just observe, that "we" are not in the habit of asking fictitious questions on the Polyanthus, and then "*modestly*" answering them ourselves. *Pansies.*—Would amateurs and cultivators for sale discard from their stocks all varieties with undecided body-colours, flimsy petals, and bad forms, one half the flowers in the published lists of the present season would be ejected. We are rather fastidious in the matter of Pansies; but the following may be relied on as prime show-flowers, combining shape, purity of ground, and distinctness of colour, joined to perfect marking:—Pearson's Milton, Sobieski, Macgraith and Black Prince, Gibbons's Belle du Monde, Prince of Orange, and Sovereign, Duft's Enchanter, and Bridesmaid.—*T. F. W.*

IV.—PINERIES, VINERIES, &c.

Pinery.—With the increased light the plants now enjoy, they will bear a greater degree of excitement by bottom-heat, as well as a warmer atmosphere. The fruiting plants may now have a bottom-heat of 85° at a depth of 9 inches from the surface. If the heat exceed 95° at the above depth, it will be requisite to draw a portion of the tan from the sides of the pots, or to use some other means to let the heat escape. The plants intended to fruit in the autumn should have from 80° to 85° of bottom-heat, and the same for the younger successions. The safest way of ascertaining the degree of bottom heat is by the thermometer. The heat-sticks in common use do very well for practised men, but the unpractised should not depend upon them, and it is of the greatest importance to be careful that the bottom-heat is of a proper degree. Shade those plants potted in February only during very clear sunshine. Be careful not to give much water to newly-potted plants, till it is ascertained that they are rooting freely.

Vinery.—Attend to the directions given last week with regard to thinning, tying, and stopping. Look well to the state of the heating material on the outside borders; for, if the heat is allowed to decline now, it will prove very injurious to the Vines and crop. Any healthy Vines, but not of good kinds, should be inarched before the wood gets too old.

Peach-house.—Continue the treatment recommended last week. Where it is intended to force Peaches, Apricots, or Cherries, in pots next season, and some suitable plants have to be provided, it should be no longer deferred. It is a good plan to pot some good maiden plants every year to succeed any that are becoming useless.

Figs and Cherries.—See last week's Calendar.

Melons.—Many will now be preparing to plant out their first Melon plants, and it is indispensable to success that the plants be strong and healthy at planting. Take care that the heat is "sweet," and that the soil is in a medium state of dryness. Those plants turned out in February ought now to be rooting freely. If the roots are appearing through the hills or ridge upon which they are planted, encourage them by adding a few inches in depth of soil of a rough turfy texture; the soil should be of the same heat as that in which the plants are growing. Keep the shoots in their proper position by tying or pressing down.—*G. F.*

V.—HARDY FRUIT AND KITCHEN GARDEN.

Protecting Peaches and Apricots.—A temporary wood coping, of from 12 to 15 inches in width, is of great advantage. Screens of woollen netting or thin bunting are preferable to thicker materials, as when the latter are used they must be drawn up or aside once a day, when the blossom or fruit is as apt to suffer from unobstructed bright sunshine as from slight frosts. Where these materials are wanting, or too expensive, a good substitute will be found in straw ropes, twisted rough, so as to leave part of the straw hanging out; these, 18 inches separate from each other, and fastened to poles 9 feet apart, constitute a good pro-

* This term was employed by early writers on gardening, but has latterly fallen into disuse. In the "History of the Propagation and Improvement of Vegetables by the concurrence of Art and Nature," by Robert Sharrock, Fellow of New College, Oxford, 1660, layering and circumposition are thus defined:—"Circumposition is a kind of laying; the difference is, that in this, the mould is borne up to the bough which is to be taken off; in laying, the bough is to be depressed into the mould. Such plants are propagable this way that might take by laying, but that the branches are too far risen from the ground to be laid along therein; and therefore it becomes necessary, since they cannot stoop to the earth, that the earth should be lifted up to them."

tection. Apricot-blossoms appear to be very thin in this neighbourhood, owing to the wood being imperfectly ripened. *Pruning and Nailing.*—Finish all sorts as soon as possible. *Planting* should now be attended to, in favourable weather. All young trees should have their roots immersed in a puddle as soon as taken up, to prevent the young fibres being dried up. *Carrots, Parsnips, and Onions.*—Sow the first main crops, if not already done. In wet stiff soils, cover the seeds with some dry soil. Sow almost everything in rows, and then any one may clean and thin. *Beet, Salsy, and Scorzonera.*—Sow a little of each for early use. *Potatoes.*—Get in the main early crops. Spring ones may be planted in beds intended for late Celery, as previously recommended. *Pits and Frames.*—Keep up the heat to Cucumbers. Grow them quick, if you want crisp fruit. Give plenty of air to Potatoes, Carrots, &c., in order that the frames may be removed shortly for other purposes.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—There will be nothing particular to do in this department but what has been previously recommended, till the bark season commences.

Coppice.—Now that the weather seems to be more favourable, all the work recommended to be done at this season in former Numbers, should be completed as soon as convenient. Cutting of hedges, corf rods, poles, &c., will do well for some time yet, particularly Birch, and some of the more copious bleeding kinds.

Young Plantations.—Works previously recommended should be forwarded with all possible haste. When the ground is a little firm, and before it becomes too hard, go over all newly-planted trees, and placing them upright fasten them firmly in the ground by various means, according to size and other circumstances; also mulch any choice sorts.

Hedge rows.—Neglect nothing that requires doing at this season, which has repeatedly been adverted to in previous Nos.

Nursery Work.—As soon as the ground is in a favourable state, proceed with all necessary work; complete the planting of seedlings, and small plants taken up. Plant Larch and early budding kinds first; sow seeds, kernels, nuts, &c. of forest-trees and shrubs, and fasten all newly-planted trees and cuttings, that have been lifted up by frost, as soon as the ground is in a favourable state.—*W. B.*

State of the Weather at Chiswick during the last 18 years, for the ensuing Week ending March 30, 1844.

March 15th Rain; fine; clear and fine at night
16th Slight haze; fine; densely overcast; boisterous
17th Overcast and cold, with easterly winds; cloudy and boisterous
18th Clear; cold and dry; overcast at night
19th Cloudy and cold; overcast; fine
20th Cloudy; rain; boisterous, with hail-showers in afternoon, and at intervals calm and sunny; clear and frosty
21st Sharp frost early; very clear; sunshine; clear, with slight frost at night

Mean temperature of the week, 4 deg. below the average.

Notices to Correspondents.

ANEMONES.—*B. V.*—Procure some good sandy loam and well-decomposed cowdung, and mix them in the proportion of three-fourths of the former to one of the latter. If the loam is stiff, add a sufficient quantity of fine sand, to make it free. Having thus prepared the compost, procure some 24-sized pots, and drain them with a few potsherds, putting over them a layer of fine charcoal, which is excellent for bulbs, independent of its preventing the admission of worms. Then pot your roots of Anemones and Tigridias, putting three or four roots (less or more, according to their size) in each pot, and placing the pots in a cold frame or pit, where they will be free from frost and damp. When they are up, admit air freely in fine days, otherwise they will become drawn and will not flower well, nor will they remain long in flower. After they have done flowering, remove them to a shady situation, and supply them plentifully with water at first, reducing it as the leaves begin to turn yellow, and, finally, allowing them to become quite dry, in which state they may remain all the winter. Some of the Anemones might be potted in the autumn for an earlier bloom. The bulbs of Tigridia keep much better all the winter if they are allowed to remain in dry soil in the pots they were grown in.¶

ASPARAGUS.—*Ponterdulais.*—Now is the time to prepare your beds for sowing the seed; but it is getting too late to plant the beds with seedlings. Sea water is most advantageously applied when the summer shoots are about 6 inches high.

AURICULAS—*A Subscriber.*—Although a Cowslip and a dark Auricula were planted in conjunction, the colour of the blossom of the Cowslip would not partake of the dark colour of the Auricula bloom.‡

BEES.—*A Lady.*—A "Nutt's hive" does not prevent Bees from swarming. The unusual proportion of drones in the old stock was an evil, but the greatest was being weakened by its offspring and the bad season. The supply of food in autumn does not seem to have been sufficient. Probably many of the Bees were induced to leave the hive on account of the mildness of the winter, and perished in search of food. Those that died in the hive would be cast out by the famished inmates. The empty combs will be of great use when the hive is replenished again with another swarm.—*J. W.*——*J. T.*—The single-leaf hive is the best for experiments. A good plan of it is given in Dr. Bevan's work on Bees. But if you wish a wooden hive with windows, merely for observing the insects at work, and expect part of their treasure, the collateral, or Polish hives are the best. You ought, however, to be careful in purchasing a hive, as some are made more for show than real utility. Mr. Wighton, in his book on Bees, mentions a very simple plan of constructing a Polish hive.—*W.*

BEET.—*A. W.*—The sweet flavour in the root seems to depend much on the soil; for the best sorts will taste earthy in some gardens, where inferior kinds are not so. The red Castelnaudary, when it can be obtained genuine, is best coloured; and it is much esteemed for its superior flavour. It is small in its whole habit, and, occupying little space, may be sown closer than other kinds. Beet requires a deep, rich, and rather light soil, to prevent its growing forked; and being impatient of frost, it should not be sown until all danger of destruction from that is over.‡

BOOKS.—*E. B.* must consult the advertisements.——*G.*—Glendinning on the Pine-Apple by all means.——159.—No man can be a good gardener by reading books. Gardening, like all arts, requires practical experience. Loudon's "Suburban Horticulturist" may perhaps answer as well as any.

BROCCOLI.—*Rambler.*—See p. 152 ‖

BURNT EARTH.—*Rural Chemistry.*—All plants will be the better for this, if it is mixed with the soil in which they grow.

CELERY AND CELERIAC.—*Rambler.*—It will be worth while to grow, or at least attempt to grow, Celeriac instead of Celery if you prefer using the former; but if your soil be not adapted for it, that is, if it be a rich loam, and not sandy, you will find its cultivation will be a more difficult matter than that of preventing your Celery from "running away or piping."‖

CHARCOAL.—*S. S. S., and Others.*—We want much a good and *cheap* contrivance for charring charcoal, peat, and similar substances. At present, every one must act upon his own judgment. The principle is, to form the charcoal with as little access of air as can be secured; otherwise, the woody matter will be reduced to ashes. Possibly, the cheapest contrivance in the long run, would be to construct an iron chamber, into whichthe wood, &c. can be introduced, and then to surround the chamber with fire. A small chimney or neck in the chamber, would allow the smoke and volatile matters to fly off.

CLIMBERS.—*A Lady* may cover her wire trellis with Jasminum revolutum, Lophospermum scandens, Convolvulus major, and Eccremocarpus scaber.‡

ENGINE-ROOMS.—*W. T. W.*—Nothing but stove plants will succeed in an atmosphere of 60° to 70° by day, and 70° to 80° by night; and they not well, because the natural difference of temperature between day and night is reversed. It is indispensable to the majority of such plants that they should have a damp atmosphere; and you possibly might obtain that by plunging the pots in a thick bed of bog-moss (Sphagnum) well wetted, or in refuse sponge clippings, if they can be had. What are called dry stove plants, such as Aloes, Stapelias, Cactuses, Mesembryanthemums, Echeverias, and the like, would suit you best. Can't you manage a Ward's case? In it you might grow any kind of small stove plants, if you can get light freely.

FIGS.—*D.*—Two good varieties of Fig for the open wall are, the Brown Turkey and the Brunswick. So long as the tree you already possess bears abundantly, there is no necessity either for cutting its roots or allowing it to ramble above the wall. Thin out some of the branches, in order to make room for a fresh supply of bearing-shoots, near the base. Protect the extremities, the bearing portion of the shoots, from the early frosts of autumn most especially.‖

FRENCH BEANS.—*A Subscriber.*—The cause of your French Beans dropping their blossoms is no doubt owing to cold and damp combined; but, from what you say, principally from the latter.‡

FRUIT-ROOMS.—*N. V.*—Your fruit-room window should face the north, and it would be advisable to have shutters on it, so as to be opened or shut as required.‡

FUDGE.—*An Inquirer* must permit us to class under this head the information he has received. We cannot answer the question about the Botanic Garden. Why not write to Mr. Maund?

THE FIG.—*Clericus.*—If your Fig-tree does not bear, it is owing to some other cause than the advance of another tree in its neighbourhood. Caprification is not required in this country. If, however, your fruit swells pretty well, and then drops off, try the effect of moistening the eye of the Fig with a little sweet-oil, at the time when it is open.

GRASS SEEDS.—*Ponterdulais.*—The Grass which smells like new Hay is the Sweet Vernal (Anthoxanthum odoratum); but it is of no use in a lawn. The best for that purpose are the Crested Dogstail and Meadow Poa. Certainly cut down your Calceolarias, &c., if the old stems are on them; but there is no advantage in doing so with the new shoots. All Greenhouse plants should be repotted now, if they are to be fine; if you do not care for that, you may let alone such as are to be turned out in June.

HEATING.—*R. S. D.*—Will not the Heckfield-pit plan at p. 892 (1843), or another in to-day's paper, answer your purpose? They are both excellent in different ways.——*M. J. R.*—Your tank is unnecessarily deep; six inches are enough. We do not otherwise object to your propositions. Iron will, however, be much better than wood and stone, if you do not mind a little present expense. All, however, depends on the degree of forcing you wish for. If it is only to bring Grapes a little forward, then wood and slate will do well enough. All the modern boilers are sufficiently good, and we should, for such a job as yours, take the cheapest. There is more difference between many of the boilers in theory than in practice. A good iron boiler well set is quite as useful as one of copper, unless you want to have it exposed to view.

HOTHOUSE BULBS.—As you are an *early member* you may refer to various answers to correspondents, and to the Indexes of former Volumes, for the information you seek. The cultivation of each of the bulbs you inquire about has been *fully* explained on former occasions.

HOTHOUSES.—*N. N.*—Your plan for propagation is unobjectionable, provided you can prevent the materials in your bed from becoming dry, in consequence of the action of the pipes. It would be desirable to place upon them an evaporating-pan. The Cannon Hall Muscat is different from the common Muscat, but not better.

INSECTS.—*Peter Mackenzie.*—The beetle you found in the Beans is the Bruchus granarius, figured and described in last year's *Chronicle*, p. 188. It is not the same which eats the edges of the Bean leaves. *R.*——*E. B.*—The insects in your Cucumber-frames are the Acarus coleopterorum, which infests beetles inhabiting dung and putrid animals. They are conveyed into your frames, in all probability, with the hot muck, and a single diseased beetle, concealed in the earth or in a rotten Cucumber left for seed, would generate myriads of the Acarus in a short space of time. But are you convinced that these mites eat the roots of the Cucumbers? *R.*——*J. Took's* little beetle, which he considers a troublesome pest amongst his Cucumber plants, is the Hister (Abræus) minutus. We believe that he need not apprehend any mischief from its appearance; but should we be mistaken, we shall feel obliged by his correcting us. *R.*——*A. F.*—We cannot make out the name of the animal complained of as a pest in his Cucumber frames; but if he will favour us with specimens, we will advise him on the subject. *R.*——*A Lady's* Pelargonium-leaves have been eaten by some animal infinitely larger than those which were detected by her; but whether the culprit be the caterpillar of some moth, or a slug or snail, which probably ventures out at night only to feed, it is impossible to say, but by searching after dark the truth may be ascertained. *R.*

MANURES.—*G. S. T.*—The ammoniacal liquor of the gas works, is not gas-tar, but what they call gas-water, through which the gas passes in the process of purification.——*E. A. N.*—It is very troublesome to char saw-dust. It can only be done by great care in a sort of kiln furnace, expressly constructed for the purpose, and must be *quite dry.*——*Amateur.*—No doubt your Pernambuco Gourd will require the management of a Melon. We know nothing of it.——*Jack.*—We do not know what the effect of Potter's Guano may be on resinous trees, such as Firs; for other plants, it seems to be generally useful. Both Peruvian and Potter's Guano are far better than nitrate of soda; but the Peruvian requires to be reduced in strength by being largely mixed in the soil or cinder-ashes.

NAMES OF FRUITS.—*J. G.*—The Apple you sent is correctly named Hammond's Pearmain. It is a Suffolk variety, excellent as you describe it to be.‖

NAMES OF PLANTS—*W. H.*—Cotoneaster microphylla ‡——*Jane.*—Vestia lycioïdes.——*C. J. C.*—Catasetum discolor; not an uncommon species. You will hardly find twelve *good* varieties of Azalea Indica, if you buy all that are on sale. Phœnicea, alba, variegata, lateritia, and the old Indica are the best.——*W. Rayner.*—What you have got for Martynia fragrans is some kind of Kail!——*G. H.*—Your bulbs are small specimens of a fungus called Scleroderma vulgare.——*A Reader.*—Your plant seems to be Eria stellata, and not Stanhopea nobilis.

ORCHIDACEÆ.—*H. T.*—There are no exotic Orchidaceæ in cultivation that would succeed in a Vinery all the year. The dry atmosphere in summer necessary to colour Grapes, and the low temperature in winter required to ripen the Vines, would destroy the most hardy sorts.§

PELARGONIUMS—*C. D. F.*—Your plants of these, that have been kept in a cellar during winter, should be replaced in pots as soon as possible. ‡

PHLOXES.—*A Subscriber.*—The following 12 are showy:—*Dwarf or early flowering kinds:* Phlox nivalis, white; P. procumbens, purplish blue; P. amœna, rosy red; P. setacea, pink; P. ambigua, rosy purple; P. Nuttalliana, rosy pink. *Tall or late flowering kinds:* P. omniflora, white; P. Brownii, crimson; P. picta, lilac striped; P. Van Houttii, purple striped; P. Coldreyana, bright red; P. tardiflora, white. We have had no experience with Potter's Liquid Guano.¶

PINES.—*A. N. S.*—The dung of deer or sheep or pigeons, steeped for a few hours in water and well stirred, then left till it is clear, will prove as useful as anything. We should not value the second infusion. The action of patent manures on the Pine-apple is unknown; but they are well worth a trial. The best Pines are the Queen, Black Jamaica, and Montserrat. None of the English-raised seedlings are first rate. The Cayenne Pine is from French Guiana; cannot state its price; that is the affair of the nurserymen. How *can* you suppose that the seeds of a plant infested with insects will also produce a filthy offspring?

POOR-RATE.—*A Constant Reader and a Rate-Payer.*—The overseer can demand the poor-rate after the quarter for which it was made, and there is nothing to prevent his collecting two rates for two different periods at the same time.

POTS FOR CARNATIONS.—*A. B.*—The pots commonly made and used for the purpose of blooming Carnations in, are called wide-mouthed 12s. Two plants are put in each pot, and they are made wide at the top for the convenience of layering the plants in.*

STOCKS—*Vectis.*—There is no means of distinguishing a double from a single stock before the flower-buds show; when they do show it is not too late to transplant the stock, if the operation is performed with care. ‡

STRAWBERRIES.—*A Novice* seems to have ruined his plants in pots by forcing them too quickly. If they are to be fine, the temperature of their forcing-house should be raised very slowly at first. Probably the Violets have been spoiled by similar means.

VERBENAS.—*A. Y. L.*—Six plants will be sufficient for a bed of Verbenas the size you mention; when they are planted peg down the branches in the direction of the vacant spaces; they will readily take root, and, sending forth fresh branches in different directions, the surface of the bed will soon be completely covered. We recommend you to procure V. Symondsii, which is a brilliant orange scarlet, a prolific bloomer, and one easily preserved in the winter. In September, when the plants are growing vigorously, it is a good plan to sink some small pots in the earth, filled with soil, and passing a branch over it peg it down upon the earth; the pot will soon become filled with roots, when it may be cut from the parent plant: these should be re-potted and encouraged, and when winter approaches put them into a cold frame, or bring them into the house; give very little water during winter.*

VINES.—*A Subscriber.*—It is not surprising that your Vines only four years old are not now in a bearing state, after having been forced summer and winter, and sometimes prematurely stripped of their foliage by your predecessor. You cannot do better than cut them back in order to get good bearing-wood for next season.‖——*T. Y. P. R.*—It is a disputed question, and you had better put it to the test of experiment. If the laterals of Vines are permitted to grow without being stopped, they will probably injure the bunches; but the question is, whether it is not better to leave them and stop them than to destroy them entirely. Your gardener is right in not risking the experiment upon his own authority; but you can relieve him from the responsibility by directing the experiment to be tried.

WHITNEY'S VARNISH.—*C. Gyde.*—Your muslin is not so clean and white as Mr. W.'s, but it is as transparent, and will answer the same purpose.——To a *Constant Reader* we return the same answer; his, however, is not so good as Mr. Gyde's; that is, it is less transparent; but that may be owing to the stouter quality of the linen.

MISCELLANEOUS.—*Ignoramus, W. M.*—Although truth is seldom elicited by ridicule, yet you employ your weapons with so much good nature, that we would find room for your remarks if we could, and probably shall do so hereafter. In the meanwhile we would submit to you that it is not fair to expect from a mere gardener that degree of clearness which is demanded from a scholar, and that with the one, as with the other, the context will often show the writer's meaning, better than his actual words. Indeed, the old saying, *ex fumo dare lucem*, shows that educated men are sometimes sufficiently obscure in their language. If you will again read the editorial remarks you will find that they are used with considerable reserve, and relate to the general tendency of the articles criticised, and not to particular opinions, which of course *we* should not defend. We attach importance to these papers notwithstanding their obvious faults, and trust hereafter to convince you that although there may be a good deal of smoke it really conceals a reasonable quantity of light.——*W. B. B.*—A Walnut can only be grafted on a Walnut; the operation can only be performed when the tree is growing.‡——*A. B. C.*—Asphalte was advertised last week. For the purpose of preserving the points of stakes, we imagine that one kind is as good as another. ‡——*A Subscriber.*—No.——*One of Ten Weeks.*—You will gain the information you seek from the Secretary of the Royal Agricultural Society in Hanover-square. Urine is of the greatest value; it should be mixed with twice its quantity of water, and allowed to become putrid, when it may be mixed with earth into a rich compost.——*W. C.*—You may cut hurdle coppices up to the end of April. The best Willow for planting in such places is the Bedford.——*Northumbriensis.*—As the Deodar is a Mountain plant, it is to be presumed that it will stand high winds as well as *any evergreen.* Dr. Royle says it is sometimes 10 ft. in diameter. Willow and Poplar form the purest charcoal.——*John Foster*—You may kill blackbirds by common rat-traps, baited with anything they like. Probably jackdaws and thrushes may be killed in the same way.——*A Subscriber.*—West Indian Agriculture cannot be advantageously dealt with except by a person who has visited the islands. It is a pity that the planters do not send out a scientific commission, which, if well selected, would be the making of them. To *speculate* on such matters might do harm. We agree with you that there *is* some room for fearing that misdirected zeal may do harm. At the same time we do not see why stirring the ground should be disadvantageous. Ratooning might, we presume, be dealt with like the stools in a nursery-ground. What the Cane-fields want is plenty of strong manure, and a thorough breaking up of the land.

SEEDLING FLORISTS' FLOWERS.

CINERARIAS.—*J. S. J.*—Your seedling named No. 1, Blue Beard, is a very beautiful variety; the colour is a splendid blue, the flowers large and showy, a decided acquisition. No. 2, Bonny Bess, is sweet in colour, but it differs but little from many that are out.——*W. G.*—There is a pleasing variety in the colours of your seedlings, but the petals appear to want substance, and the flowers are very small. No. 3 is the most novel in colour, and No. 5 is prettily marked, but they both want size, and in all the petals are too narrow.——*F. B. Y.*—Two flowers of the largest Cineraria we have seen, measuring two inches in diameter; the flower is white, slightly tipped with a purple tinge; petals stout and well formed.*

*** As usual, many communications have been received too l[illegible]

A VACANCY exists for a young Gentleman with a respectable Farmer and Grazier, in Lincolnshire, occupying extensively various descriptions of Land.—Direct to X X., care of Messrs. Brooke, Lincoln.

ON SALE.
RED AND WHITE CLOVER-SEEDS, TREFOIL, PARSLEY, ITALIAN and DWARF RYE-GRASSES.
English and Foreign LINSEED CAKE.
JOSH. OUSTON & SONS.
Office, 47, Queen-street, Hull (adjoining the Vittoria Hotel.)

FARMS TO BE LET IN THE ISLE OF WIGHT:—

FORELANDS, at BEMBRIDGE, in the Parish of BRADING; Containing:—Arable . . . 220a. 1r. 33p.

April 1 Yoxford. Wenlock. W. Firle.
April 2 Framlingham. Rayleigh.
April 3 Harleston.
April 6 Collumpton.

THE following are useful remarks upon an important subject. They are extracted from a periodical published in 1798*, which was edited by Dr. Anderson, of Edinburgh:—

"Mr. Locke began his 'Essay on the Human Understanding' by showing the necessity of adverting to the precise meanings of words. The same thing ought to be done respecting Agriculture; for we shall find that the frequent use of words and phrases which have no precise and definite meaning affixed to them has been one of the most powerful causes of that retardment which has so justly excited our wonder. To give an example: every person who has but begun to enter upon the study of Agriculture has heard of three or four grand divisions of soils, viz., clays, sands, loams, and gravels; and to each of these terms he annexes an appropriated idea, which particularly corresponds with the qualities of such soils as have been denominated clays, sands, loams, and gravels, in his native place; so that, whenever a soil of any of these denominations occurs to him, whether in conversation or in writing, he thinks it must be somewhat similar in its nature and qualities to the soils which he has been accustomed to discriminate by those names; but as the clays of one region are extremely different from the clays of another region, some of the soils so called being endowed with almost inexhaustible fertility, while others are as justly characterised by that of insuperable sterility; and as there are innumerable shades between these two extremes—as it also happens that there is a diversity equally great in regard to every other peculiarity of clay as that which respects its vegetative power, it must follow that whenever a clayey soil is mentioned among any number of farmers, that single word must convey to each of them a separate idea." Dr. Anderson then proceeds to show that the benefit which other sciences derive from the arts of writing and printing, by the accumulation through these means of the observations and discoveries of many generations, is comparatively lost to Agriculture; "for so long as one man remains ignorant of the precise meaning of the words that are employed by another, he cannot benefit by the acquirements which that other shall have made." The works of his predecessors are thus in great measure useless to him, and "each individual must begin with the knowledge that his own observations furnish; nor is he able to communicate his knowledge to others, unless it be to his immediate descendants or his nearest neighbours, to whom he may point out the identical objects with which he has been conversant. And thus we can account for the fact which must have been noticed by every Agricultural observer, viz., that striking improvements in this line have always been of a local nature."

Agricultural writings of a practical kind are generally descriptive of certain operations on certain soils, and they state the results of those operations as the test of their value. Now it is evident that the usefulness of all such writings is dependent both upon the accuracy and clearness of the description given of the soil (for many operations which would benefit some soils are injurious upon others), and upon the accuracy with which the results of those operations are described. Whether it be the fault of the author, or of the means he has at his command, if the account he gives under either of these heads be not clearly conveyed to his readers, it is evident that, by acting in accordance with what they believe to be his advice, they will either suffer absolute injury, or at any rate be much disappointed in the amount of benefit they receive.

In the above quotation, Dr. Anderson refers especially to the importance of accurately describing the soil on which any operation to be detailed is to take place; but it is obvious that his remarks are demonstrative also of the importance of employing terms by which all may understand the nature and quantity of the results of such operations; for the value of an author's report of experiments depends as much upon his due attention to the latter, as it does upon the care with which he attends to the former of these particulars. In all writings of this kind, those weights and measures which are sanctioned by Act of Parliament ought alone to be referred to. The use of LOCAL WEIGHTS AND MEASURES has been productive of much confusion and uncertainty, and, like every other source of error, is often provocative of angry and useless discussions.

We have made some inquiries into the quantity of certain measures of length, surface, and solidity, which have been and are used in many districts of the kingdom, and the following information, which we have received on this subject from many kind correspondents, is published with the view of exposing the absurdity of the system. To commence with measures of length:—the perch, pole, rope, or lug, (for it bears all these names,) which is properly the fourth part of a chain, or 5½ yards long, is the ordinary unit of length employed in the measurement of various descriptions of work; as the digging of drains, cleaning out ditches, building walls, grubbing up hedges, &c. Over Ireland it is 21 feet in length; it is the same in Richmondshire, Yorkshire; near Rayleigh, Sussex; and, for certain descriptions of work near Chepstow; for other descriptions of work near Chepstow, it is 18 or 20 feet; at Truro in Cornwall, at Cardiff, at Witney in Oxfordshire, in Berwickshire, and in Fife, it is 18 feet; in East Lothian, for certain kinds of work it is 18½ feet; at Baldoon, in Wigtonshire, and at Collumpton in Devonshire, it is 20 feet in length; at Llandilo and Swansea in South Wales, and in South Lancashire it is 24 feet in length. The unit of surface employed in the measurement of digging, paring and burning, and various kinds of field-work, is generally the square of the perch in length, whatever that length may be in the various districts in which it is used. The imperial acre is 4840 square yards; the acre of South Wales is 5120 square yards; that of Ireland and of Lancashire is 7840 square yards; that of Cornwall, the same as the Scotch, is 1¼ imperial acres; the Cheshire acre is 10,240 square yards. With reference to measures of solidity:—the imperial bushel is an arbitrary measure of 8 gallons, each containing 277·274 cubic inches; the Cornish bushel and the Carlisle bushel each contains 3 imperial bushels; the bushel used about Llandilo in South Wales, in Monmouthshire and other places, contains 10 gallons; the old bushel used about Chepstow contains 10½ gallons; and, which is the most extraordinary measure ever we heard of, the old bushel used near Swansea contained rather more than 3 imperial bushels, viz. 5 stricken half-bushels, and the 6th heaped! We extract the following from Mr. C. Johnson's "Encyclopædia of Agriculture:"—"At Abingdon and Andover, a bushel contains 9 gallons; at Appleby and Penrith, a bushel of Peas, Rye, and Wheat, contains 16 gallons; of Barley, Malt, and Oats, 20 gallons. A bushel contains at Carlisle, 24 gallons; at Chester, a bushel of Wheat, &c. contains 32 gallons, and of Oats 40; at Dorchester, a bushel of Malt and Oats contains 10 gallons; at Falmouth, the bushel of stricken coals is 16 gallons; of other things 20, and usually 21; at Kingston on Thames, the bushel contains 8½ gallons; at Newbury, 9; at Wycomb and Reading, 8¾; at Stamford, 16 gallons. The Winchester bushel contained 2150·42 cubic inches. The imperial bushel is therefore to the Winchester bushel as 2218·192 to 2150·42."

In Scotland and the north of England, grain is often sold by the boll, containing so many imperial bushels. In Wigtonshire, the boll of Oats contains 12 bushels, and that of Potatoes contains 16 bushels of ½ cwt. each; at Newcastle, Hexham, and Richmond, the boll of Wheat contains 2 bushels; at Stranraer, it contains 4 bushels, and in East Lothian, and Berwickshire it contains 6 bushels; at Hexham, the boll of Oats contains 5 bushels, and at Stranraer, it contains 12 bushels. The sack of Wheat contains in some places 3, in others 4 and 5 imperial bushels; formerly in some parts of Monmouthshire it used to be understood to weigh 336 lbs., *including the bag!* The sack of Potatoes weighs 200 lbs. in the Isle of Thanet; in East Suffolk, &c., it contains 3 heaped bushels; in many other places it contains 5 heaped bushels, and weighs 2¼ cwt.; at Collumpton, it weighs 160 lbs.; at Rayleigh, it weighs 252 lbs. In Ireland, Potatoes are sold by the barrel of 20, 24, 48, and 96 stones.

We need not continue this subject further into the various ways of selling butter, cheese, hay, wool, meat, &c. Enough has been said to prove the extreme absurdity of sanctioning in any way the use or preservation of local weights and measures; and from what has been said it may be easily inferred of Agricultural writings which adopt local terms, whether of quantity or quality,—terms signifying length, surface, and bulk, or descriptive of soils and their production—that such writings are liable to mislead rather than inform. We are glad to find that our national Agricultural Societies are about to take up this subject, and we hope that their endeavours to induce the general adoption of a uniform system of weights and measures will be attended with success.

* Recreations in Agriculture, Natural History, Arts, &c., by James Anderson, LL.D., &c. &c. The writings of Dr. Anderson on Agricultural subjects, though published so long ago, are still among the most valuable in the English language.

SALT AS MANURE.

AMONGST the many manures strongly recommended to farmers, few are more highly lauded than common salt; which, it is stated, supplies to crops all that they require, being at the same time the cheapest, most effectual, and most universal of all known manures. As to the practical evidence on which such assertions are based, I will say nothing; well authenticated facts are always valuable, and we may form our own conclusions from them; the advocates of salt as a manure are, however, not satisfied with stating simple facts respecting its use, but theorise as to the probable manner in which it may act, and endeavour to prove by those theories, its excellence as a manure. Two chemical reasons are advanced to prove the value of common salt as a fertiliser. It is stated that salt fixes ammonia; and secondly, that when decomposed by ammonia, alkali is set free, which greatly increases the fertility of the soil. In the *Gardeners' Chronicle* for 1843, No. 8, I made some observations on the action of salt on carbonate of ammonia, my object being to show, that the assertion that salt was one of the best fixers of ammonia, was not supported by chemical facts; but that, on the contrary, it was highly improbable that salt could be used for that purpose, although true that under particular circumstances salt and carbonate of ammonia partially decompose each other. As the subject is again exciting a good deal of interest, I am induced to make a few further observations on the subject, more especially in respect to the second assertion, that salt, when decomposed by carbonate of ammonia, furnishes alkali to plants.

There can be no doubt that in some situations, on particular soils, and applied to particular crops, salt in moderate quantity is an excellent manure—abundant evidence of this is given in the writings of those who have studied the effects of manures; but at the same time there are many cases in which its application has done no good, and indeed sometimes produced evil effects. In many cases, no doubt, these effects were the result of too large an application of salt, whilst in others the nature of the soil was such as to render the salt of no value.

In the following observations, my object is not in any way to discourage the employment of salt, but merely to point out the questionable nature of the scientific reasons in favour of its application, which are made use of by its advocates. When very strong solutions of common salt and carbonate of ammonia are mixed at low temperatures, they slowly and imperfectly decompose each other, and a quantity of bi-carbonate of soda and muriate of ammonia are formed, whilst a portion of ammonia is set free. The bi-carbonate of soda being almost insoluble in the solution of muriate of ammonia, may be separated and obtained pure, whilst the muriate of ammonia may be obtained by evaporating the solution and separating it from undecomposed common salt, and free ammonia. If, in place of separating the two substances, a quantity of water is added, the bi-carbonate of soda dissolves, and the two salts re-decompose each other, common salt and carbonate of ammonia being formed. In the same way, if solutions of carbonate or bi-carbonate of soda be mixed with solution of muriate of ammonia, they mutually decompose each other, and form carbonate of ammonia and common salt.

It is perfectly true that very strong solutions of bi-carbonate of ammonia and common salt decompose each other, and that common carbonate of ammonia decomposes solution of salt, when carbonic acid is passed through it; but it is equally true that this only holds good when the solutions are concentrated; if dilute, no such change takes place. When salt is employed as manure it is exposed to the action of a very dilute solution of carbonate of ammonia, for dew and rain-water contain a minute quantity of that salt; under these circumstances it is not to be expected that the salt will be decomposed; and it is not reasonable to compare what takes place in strong solutions in close vessels, with what takes place in the open air with abundance of water. We can only compare the action of rain-water on salt, to the action of very dilute solution of salt and carbonate of ammonia, and such solutions do not decompose each other. Although chemical facts are certainly against the decomposition of salt by carbonate of ammonia, or the fixation of ammonia by common salt, yet this in no way diminishes the value of salt applied as manure.

It has been assumed that salt cannot act beneficially on vegetation except it be previously decomposed, but there appears very little proof of the truth of this assertion. Even supposing it proved that salt must be decomposed, it is yet by no means impossible that this decomposition is effected after it has been absorbed by the roots of plants; on the contrary, it is very possible that such a change may take place in their organs, and more likely than that it should be effected in the soil by the carbonate of ammonia, of dew and rain. Salt mixed with soot is often praised as an excellent manure, and mentioned as affording an example of the decomposition of the former by the carbonate of ammonia contained in the latter; there is, however, no need to suppose any decomposition to have taken place to explain the beneficial effects of such a mixture. When plants are manured with ammoniacal salts they grow with increased vigour, the roots increase rapidly, a larger supply of inorganic matter is required, and if this is withheld from the plants they do not flourish. When inorganic manures are used, plants acquire increased powers of absorbing ammonia, and when manured with salts of ammonia they acquire increased powers of absorbing in organic matters; hence, the best manures are those in which both classes of substances are supplied at the same time, and hence it would be reasonable to expect that salt and soot together would produce a more powerful effect than either alone, except in soils rich in alkaline or ammoniacal salts. The mode in which manures act can only be ascertained by observing the effects which they produce on living plants, but the changes which take place in the organs of plants cannot be compared with those which are the mere effects of ordinary chemical action. The process which can effect the decomposition of carbonic acid and water in the organs of a plant, are equally able to cause the decomposition of common salt, and other inorganic compounds.—*E. Solly.*

SOME REMARKS ON DRAUGHT.

Whatever there may be of theoretical uniformity among scientific men respecting the mechanical principles to be regarded in the construction of carriages, and the manner of applying the draught powers, there is much difference of opinion among mere practical farmers on those points. For instance, some are advocates for the four-wheel waggon, and others for the Scotch cart (or one on a much smaller scale), each party giving very good reasons for their preference of one vehicle to another. Some again maintain that the teams for all wheel conveyances and ploughs ought to be yoked in single file; and others contend (and with these I concur,) that they ought to be placed two or even three abreast, when there is room enough for the purpose. But circumstances may render it judicious to adopt a system, though it may not be correct in the general abstract principle. A Norman French farmer employs a team of five or seven horses and oxen (they are generally combined) in a single row, to draw 2 tons weight it may be of farm produce, though half or a third of the number would be sufficient for the purpose on a good road, because the execrable state of his bye-lanes renders the draught severe along them; and he arranges his cattle in single file on account of the narrow breadth of those lanes. Again, no sensible man, knowing that a horse, which can carry but 2 cwts. conveniently on his back, will draw 10 cwt. with as much or more ease in a cart, would say, generally, that it would be economical to convey manures on the backs of mules or horses, or by sledges instead of carts; yet in very hilly, uneven places, or along the rough and precipitous passes which in many localities conduct to a sea-shore, loaded panniers or sacks upon the back of a horse, or a load on a sledge, may be more safely and effectively conveyed in that manner than by means of a cart. Perseverance, however, in an imperfect practice (advisable only under peculiar circumstances) is evidently absurd when the necessity for it has ceased by the change of those circumstances. The Frenchman pursues his favourite mode of yoking his teams even on the finest roads imaginable, though in every winding of a road there is a loss of power consequent upon it (incurred by the deviations from the true line of traction). He is *accustomed* to that method, which he acquired under very different circumstances, and will not adopt a new one, though in a case which, by its suitableness to his purpose, plainly invites its adoption. Hardened by custom, he carelessly observes the unequal and severe labour which is imposed on his shaft-horse in turning corners and crossing watercourses, and the painful pressure that the poor animal suffers from the belly-band whenever the weight is thrown backwards from its equilibrium by the prevailing system of harnessing. In Ireland, where the great improvements in the construction of roads within the last 15 or 20 years has led to the almost universal substitution of the spoke for the block-wheel, as the solid wheel was termed, and the abandonment of the back-load system, there is still a disinclination to adopt the high spoke-wheel, from a lingering regard for the form of the original wheel, which was found useful as a drag in descending hills, and in preventing the rude shocks which the horse would receive on very rough roads, from the concussions given to the lighter, and therefore more unsteady wheel. But another consideration also operated to preserve the use of the very defective block-wheel, even after the supposed necessity for employing it had been removed by the new construction of roads; namely, a penny-wise sort of economy evinced in the determination to wear out the old wheels before incurring the expense of purchasing new ones—a kind of prudence somewhat similar to that of a thrifty parent, who is unwilling to dress his hobbedyhoy son in a new long-tailed coat until he has completely worn out his jackets, notwithstanding that he has much outgrown them. There is, however, this difference between the two cases: in the latter there is a positive saving, and that without any hindrance to the boy's advancement, either in mind or body; while in the other case there is loss in the lesser quantities and weights conveyed by means of these imperfect wheels, and the greater wear and tear of the animals employed in moving them.

There is still, I apprehend, not only in Ireland, but in Great Britain generally, a deficiency in the formation, or rather in the height of cart-wheels. From frequent observation of the power of those which are used in France, which enable a very feeble horse to draw great weights, I am convinced that the average height of the cart-wheels we employ in road and farm labour ought not to be less than from five feet six inches to six feet. The wheel of the common Irish farmer rarely exceeds three feet six inches; for he is impressed with the notion that, if it were higher, the pressure would be too great on the horse when going down hill, having no knowledge of the simple contrivance of the Frenchman, who, by means of a piece of wood which can be pressed from behind by a simple sort of screw, causes a degree of friction which retards the action of the wheels, so as to relieve the horse in the descent. In a level country, there can be no doubt whatever of the mechanical advantage to be derived from a very high wheel, and still more on ascending ground; and though it often occasions difficulty to the horse on descending ground, from want of a friction-break, or the neglect of the carter to apply it, there is on the average of work a decided advantage obtained from the use of the high wheel, provided that it does not exceed the elevation which will admit of an horizontal shaft, or, still better, allow a trifling declination from the fore point to the other extremity; and, I may add, from a narrow axle, which causes a lesser friction than a wide one.

Having referred to the Continental custom of attaching the animals of draught to carts and roulages, one before the other, and being of opinion that the Scotch cart, with one horse, or two at the most, is the most efficacious vehicle for ordinary work, I may venture to advert to the reasons which have been sometimes urged in condemnation of the former mode, because, though the conclusion is practically correct, one of the chief reasons assigned against the yoking of the cattle to carriages (or ploughs) in single files, is that there is a loss of power in proportion to the distance at which they are placed from their load. I have myself erroneously concurred in that opinion. Now, in the first place, the term proportion, used in this sense, is wrong in a scientific point of view; for though the draft may increase or diminish, as the distance increases or diminishes, there may be neither proportion nor ratio in the amount of increase or decrease of both, as compared together.

The waste of power in the case I have supposed, has nothing to do with the distance. There is no ratio whatever in respect of that; the loss of power is only occasioned by a deviation from the direction in which the weight is to be moved; and in practice that deviation is continually occurring, owing to the inequalities and windings of a road. If there be two or more horses abreast, there can be no deviation from the true line of draught; still less can there be any such deviation in the case of the single-horse carts. From knowing that the mere increase of distance between the horse and his load will not diminish his powers of draught, it follows that very long traces may be very advantageously used on occasions; for instance, to effect the passage of a cart through a slough, at the entrance of a field, which has been deeply rutted from frequent traffic, it is plain that all the horses of a team, except the one in the shafts, would have greater power in drawing, if they were on firm ground within the field, than if they were labouring through the slough, along with the shaft-horse; a pull from the firm footing within, however long the distance, would give increased power. If the line of traction be preserved, all is right on the general principle.—*Martin Doyle.*

ON THE APPLICATION OF CHEMISTRY TO AGRICULTURE UPON RATIONAL PRINCIPLES.—No. XI.

(*Continued from page* 170.)

Every practical farmer is so well acquainted with the value of good rotten manure, that it would be a waste of time for me to dwell upon the advantages derivable from the decomposition of vegetable matter. Sir H. Davy recommended the application of dry Straw to land, in order that plants might derive the benefit of its slow decomposition. Others have used dry bran upon the same principle. A little reflection, however, will convince the reader that such experiments must fail, and that it is better to secure the decomposition of these substances, before they are used. But some one will exclaim:—"Do you not obtain all the results of decomposition, and prevent volatilisation, by burying the straw?" The answer to this is simple and conclusive. In the decay of Straw by itself, there is no volatile matter formed, and therefore none can be lost. It is only where urine or animal matter is added to the Straw, that any appreciable amount of ammonia is formed by the decomposition.

When the crop of Corn is removed from the land, the grain, converted into flour or malt is consumed by man, and the animals around him. The Straw thrown into the yard is formed into manure by the cattle. Now Straw will not readily decompose without moisture. In the straw-yard it is mixed with rain and urine, both containing nitrogen. The Straw and dung contain little or no nitrogen, and we therefore see that the cause of decomposition is the source of volatilisation,—that the two phenomena depend upon each other. Without urine the Straw would make very indifferent manure, for the nitrogen of the urine is one of the principal sources of the azotised part of the future crop—the seed. Nothing can be more simple or true than this well-established fact. Surely, then, the grand object of the farmer should be to secure to his crops of grain as much azotised matter as possible; for upon this depends chiefly its *quantity*, the *quality*, and the *weight*. The more azotised matter within certain limits, the more Corn—is as clearly demonstrable as a problem in mathematics, or as the fact of the quantity of fat in the sheep being proportioned to the amount of oil-cake and turnips that it devours. The more Straw or carbonised matter in the manure, the more Straw in the crop, is also equally clear; for Straw by itself can never produce grain.

From the rain, then, containing ammonia, and the urine of cattle containing urea, (which by decomposition is converted into the carbonate of ammonia,) the Straw in the farm-yard receives a considerable quantity of azotised matter, but much of this is lost by volatilisation. The carbonate of ammonia is a volatile salt, and the grand object of the Agricultural Chemist is to fix it, convert it into a salt of ammonia, which is not volatile; and the sulphate or phosphate are of this character. Numerous remedies have been proposed to fix the ammonia of dunghills, and the experiment proposed by Professor Henslow, and now in progress in the county of Suffolk, will set at rest the value of one agent proposed—gypsum. But I do not think that the fixation of ammonia in the dunghill is of so much importance to the farmer, when compared with the means which he has always at hand, at little cost or trouble, of obtaining large quantities of ammonia easily fixed in the form of liquid manure or urine.

For this purpose every farm-yard must be provided with tanks of considerable size, in which the urine must be collected, and treated in a manner to be explained presently. That the urine is the only azotised source of stable-manure I do not mean to contend; for dung, straw, and rain-water, all contain nitrogen in small quantity. But the aggregate of these sources is so small when compared with that contained in the urine, that we are justified in treating of that liquid as the real and practical source of supply. If any person wishes to convince himself that urine contains much nitrogen, let him place a vessel of it aside for a fortnight, and then add sulphuric, or any other acid to it as long as effervescence continues. From the amount of acid used, it is easy to calculate the amount of carbonate of ammonia which the decomposition of the urine has formed. If this amount is estimated at half the weight of the acid, it will be near enough for ordinary purposes. Liebig has stated from theory that a pound of urine contains the elements necessary to form a pound of Grain. In an experiment which I made, I have proved the soundness of Liebig's "thought;" for, from 30 lbs. of urine, with the ammonia fixed, I obtained of produce 77½ lbs., and about 37½ lbs. of Grain to 40 lbs. of Straw. Now, every human being passes about a pound of urine in the twenty-four hours, upon the average; and it has been estimated that every adult is capable of manuring, by his urine alone, an acre of land per year! and yet how little of this is saved?

I have stated that, directly or indirectly, every human being is indebted to Agriculture for his food. It matters not whether he lives upon beef, or pork, or bread, or potatoes,—upon the whale blubber and roots of the Fuegian, or the oil and saw-dust of the Esquimaux; still we can trace the primitive organisation of the elements of animal nutrition to the vital operations of plants. Now, almost all human beings and animals, the former especially, take in more azote in their food than the waste of the body requires. If this takes place with the principal element of respiration—carbon (as is often the case), it is deposited as fat. But the excess of nitrogen is separated from the blood by that beautifully constructed organ the kidney, and thrown off in the urine. Nature intends to restore to nature all that is superabundant in her living organism. It is the negligence, or the blindness, or the indolence of man that prevents this means of increasing the produce of the soil from being taken advantage of.

Human urine is much richer in nitrogen than that of cattle—according to Liebig, as four to one. It is, consequently, four times better for the purposes of agriculture. But the urine has other ingredients of the seeds of corn besides azote. The seed contains phosphate of lime and magnesia, and the salt is found in considerable quantity in urine. The carbon for the starch in the seed is always to be obtained from the atmosphere; but the grain cannot of course be formed without the stalk and roots; and for their formation several important ingredients not found at all, or in sufficient quantity in urine, are requisite; and these are supplied to the soil either in abundance by the original rocks from the disintegration of which it was formed; or, as is most frequently the case, they are supplied by the constant application of rotten straw and dung by the farmer. What phosphate of lime and magnesia is deficient in the urine, is supplied by the dung; and the potash, sulphur, iron, and in heavy lands sometimes silica, is restored from time to time in the straw. In addition to this, the decay of straw is a constant source of humus, which is an important means of nutrition to the young or embryo plant. While, then, the straw and dung supply the above ingredients, the urine is the great and important, though much neglected source of azote; and thus each of the parts of stable manure contain and supply the plant with the appropriate food for each portion or division of parts into which the structure of the plant can be divided: for the whole plant, it is obvious a union of all its constituents is requisite.

It is quite clear that the principle which guides the feeding of animals holds good with regard to plants. If in fattening a bullock, we select that food which will

deposit fat (the oleaginous), such as oil-cake, &c., so in desiring to increase the bulk and weight of a grain of Wheat, we select for food that which will deposit azotised matter (gluten), and for this purpose we have every element we require in urine. But as a dog will die if fed only upon sugar, so will a plant if we do not supply it with a union of all the elements entering into its composition.
—*C. B. Bree, Stowmarket.*

(To be continued.)

EXPERIMENTS ON THE RAISING OF TURNIPS.

[In No. 8 of the *Agricultural Gazette* we published the report of experiments by the Duke of Richmond and Dr. Manson on the influence of certain manures on the growth of Turnips. These experiments were apparently undertaken in competition for premiums offered in connection with the subject, by the Morayshire Farmers' Club. The second premium was awarded to Dr. Manson. Mr. M'William, to whom the first prize was awarded, has sent us the report of the Club, from which we extract the following account of his experiments.]

RATES PER IMPERIAL ACRE.

* This lot was injured by the sand blowing in a gale.

Nos. 9 and 12.—The bones were watered with the sulphuric acid the day before being sown.

No. 7.—The sulphate of ammonia, guano, and bones, were mixed together.

No. 10.—The sulphate of ammonia used was dissolved with the liquid.

Nos. 16 and 17.—The bones and guano were dibbled in with a mixture of saw-dust.

Part of two drills of each experiment, measuring 4 perches, were topped, tailed, and carefully weighed on 13th and 14th December.

The quantity experimented on was 30 acres, 2 roods, 29 falls. The liquid manure was prepared in the same way as reported on last year;* but in place of being applied with a watering-pan, as then, it was put on with a cart, constructed on purpose, to do three drills at a time, and so as to give a uniform discharge when nearly empty as when full, which cannot be done by any common discharge-pipe. When 2 bushels of bone dust per Scotch acre, with the sulphuric acid, were applied with the full proportion of water, a portion of the mixture, equal to a half-bushel of bones, was put into the cart, and filled with water, which went over exactly quarter of a Scotch acre, the horse going at the rate of 3 miles an hour. When 4 bushels were applied with the acid to the Scotch acre, with the same proportion of water, in like manner a half-bushel was put in and filled up, which went over the quarter of an acre as before; but this had to be repeated, and gone over a second time. In order, if possible, to save this labour, several experiments were tried, with half the quantity of water; in this case the full bushel of mixture of bones and acid was put in at once, and the cart filled up with water, and went over the quarter of an acre Scotch, thus effecting a considerable saving of labour; and, as far as I can judge from the experiments, with equal effect. When the proper proportion of water to be put in the mixture is ascertained by experience, the plugs which regulate the discharge may be graduated, and a series of them made so as to regulate the quantity of mixture per acre during pleasure, the horse going at the regular and common pace, without having to do so by augmenting or lessening the quantity of water, or by making the horse go faster or slower, the latter being difficult to regulate.

Remarks with regard to the varieties of Turnips.—Laing's Swedes, part of No. 3, are decidedly superior to Gibb's in point of quality and hardiness, and, under the same treatment, much heavier. 4. Dale's Hybrid have been raised on Sheriffston for years, and properly selected, and decidedly a superior variety to the other yellow sown. 15. White Globes, Gibb's London, superior variety of Turnip to the Green Top White, which were of an inferior description—bought seed.—(*Signed*) *Geo. M'William.*

ON MINERAL AND INORGANIC MANURES.

No. XI.

By Professor Charles Sprengel.

I shall now proceed to explain some other phenomena which are observed on fields manured with marl.

It has been very often observed, that marl will not produce any effect on one sort of soil, whilst on another it will act most beneficially. This is to be ascribed to the fact that marl is not only of use to plants by the decomposition of humus, but that it really nourishes them by its constituent parts. If, for instance, a soil is deficient in magnesia, but not in all other essential parts, it will not be materially improved by marl, though rich in lime, gypsum, phosphate of lime, &c., if it does not contain magnesia; whilst the same marl, conveyed on a ground which contains plenty of magnesia but is deficient in other substances, will produce the most beneficial effect. I have found this out by too many experiments for me to doubt it for a single moment. I have seen, very often, that a marl merely composed of carbonate of lime and clay, produced at some places the best results, whilst in others it produced none; but chemical analysis always pointed out to me that any soil where it showed itself very useful, contained but very little lime, whilst that where it was useless, had already plenty of lime.

It is often the case, that a soil which has been marled some time since, contains yet a sufficient quantity of carbonate of lime, whilst its fertility has nevertheless become much impaired, although there is also no deficiency of humus. The reason is, that such soil, although not deficient in lime, does not possess enough of those other substances which had been once conveyed to it by the marl. At times it is only the gypsum or potash it is deficient in, and it is merely necessary to apply to it these substances to re-establish its former fertility, or to apply an additional dose of the marl previously used. The mineral substance in which it is especially wanting is, however, often obtained more cheaply than by a repeated application of marl. In most cases, however, a soil which, after a previous plentiful manuring with marl, exhibits signs of sterility, will be found deficient in humus, and in this case the marl which may yet be in the soil cannot produce any effect, because we have seen before, that it is especially humic acid, through the action of which lime, magnesia, alumina, iron and manganese, potash, soda and phosphate of lime, are conveyed to the plants. A soil which no longer contains any humus, is called in Germany over-marled (*ausgemergelt.*) In order to make it fertile it must be manured with substances which not only contain humus, or yield humus by their decomposition, but must also contain nitrogen, as any soil which is "out-marled" is always deficient in that substance. Dung, certainly, is best in most cases, but it may be also advisable to use along with it some vegetable-mould, as it requires a great deal of dung to supply the soil even with one-fourth per cent. of humus. At times, however, a soil, though deficient in humus, will yield (after being manured with marl) some good crops, in which case it may be that the marl contains some humic particles, or saltpetre, by which latter substance the plants are supplied with that essential food for them—nitrogen.

At times marl acts the first year very powerfully, but the effect soon decreases, which will be the case if it is applied in a powdery state. It is clear that in this case the particles of lime more easily become mixed with the soil, and bring the humus sooner to a state of decomposition, and many of its other constituent parts are easier soluble in water, and can be more speedily conveyed to the roots of the plants. If, on the contrary, marl is hard or stony, it will hardly act at all for the first year or two, for the lumps will not affect the humus, neither can the water penetrate into them to receive their soluble parts. At times marl will act the first year with astonishing power, and cease altogether the second; it may then be taken for granted that it contains saltpetre, which, on account of its great solubility in water, comes soon into play, and forces the plants by its great amount of nitrogen. Marl will always act better on wet soils than on dry ones,* which is chiefly caused by the plants being only able to receive nourishment through the medium of water. If, therefore, a dry soil has been manured with marl, it is always advisable to have it fallowed by Rye, as then the moisture of the winter season will remain longer in the soil. This moisture will be instrumental in the decomposition of the coal of humus and the vegetable matter, which will increase the action of the marl. On account of the necessity of preserving moisture, it is also well to let a soil manured with marl rest for a few years after the Rye has been cut down; the field may be planted with Clover and Grasses, and used as a pasture.

(To be continued.)

* To 1 bushel of bone dust sifted out, put 29 lbs. sulphuric acid previously diluted with 56 lbs. of water; and having stood 24 hours, it was then mixed up with the full quantity of water.

Home Correspondence.

Salt as a fixer of Ammonia.—An article appeared in No. 3 of the "Agricultural Gazette," under this head, signed "Peter Mackenzie," in which it is asked if any other means of decomposing common salt for the use of land have been discovered besides that of first converting into sulphate, and then into carbonate, as described in "Rural Chemistry." I am in a situation to answer this question, and I deem it of no small importance to the farmer. I saw in my newspaper last week a recommendation to apply salt to the dunghill, stating that the carbonate of ammonia generated there would be prevented from going off into the atmosphere, if common salt were occasionally thrown on the dung, as the carbonate of ammonia and common salt would by the moisture and heat of the dunghill decompose each other, forming muriate of ammonia and carbonate of soda. Carbonate of ammonia will be evaporated into the air by the ordinary heat of a dunghill, but muriate of ammonia will not—thus we not only save the ammonia, which is the most valuable part of the manure, but we get a new ingredient—carbonate of soda, which is also highly valuable. This is all to be accomplished by buying a little Agricultural salt and applying it to the dunghill—that is to say, if the foregoing be true. On reading this I got a chemist to try the experiment, and stood by him the whole time. He saturated a solution of common salt, say ½ or ¾ of a pint, put into a white glass bottle with a wide mouth and glass stopper; he then put into this strong brine several pieces of carbonate of ammonia in lumps, so that in the event of a precipitate before the ammonia was all dissolved it should be distinctly known. After shaking the bottle for half an hour so as to dissolve some of the ammonia, it was subjected to a gentle heat, and a large deposit of white powder was the result. In this state the bottle remained all night, and next morning the powder was separated from the fluid by filtration, and it was found to be soda, and the chemist said that it was mostly in a state of bicarbonate. After the powder was dried it was tested, and found to contain 29.44 per cent. of real soda, which the chemist told me proved that it contained upwards of 80 per cent. of bicarbonate of soda. Now I know all this to be true, for I saw the whole operation, and the bottle was in my own keeping during the whole period. I have directed my people to put about 1 lb. of salt to every good wheelbarrow-full of manure that they take from the stable or feeding-stalls. The adoption of this quantity is all guess-work, and if any of your readers have any experience or information on this point, I should be glad to see it transmitted to your columns. I have considered the subject of the preparation of manures for some years past; and with this new, and, to my mind, very important fact before me, I am strongly of opinion that all newly-made manure should be accumulated under a shed, with a tank to receive the drainings, salt being intimately mixed with it, but not in too great quantity;—be sure to mind this; 1 lb. to a barrowful may be too much—this can only be known by trial. Let the drainings be pumped over the dung from time to time, and the heat of the dunghill will evaporate the watery part of the fluid, and leave all the rich salts of the urine of the animals incorporated with the dung, to be acted upon by the salt as hereinbefore described."—*J. F.*

Dibbling Turnip-Seed.—This is much practised here, and by some of our very best farmers, and we believe it to be the surest way of procuring a regular braird. One sturdy Scot with an improved hand-dibble, will go over one imperial acre in a day. He makes the holes at the proper distances; a boy or woman follows with bones, or other portable manure, puts into each hole the requisite quantity, when another boy or woman follows with the seed. They take a pinch betwixt the finger and thumb, and with finger and thumb thus joined, they shove a little of the soil above the manure, and while doing so they drop the seed. By this mode you will never see a failure; and, after a little practice, the workmen become so accurate, that they scarcely ever err in giving either too much or too little of seed or manure. Perhaps this method will not do so well with guano, but for bones it is excellent, and not expensive. This hasty notice is given

* By "dry soils" are probably meant thin stony land, easily scorched in summer.

from having seen the matter hinted at in the *Gazette*.—*W. Drummond & Son, Stirling.*

Bones.—In the *Agricultural Gazette* of the 13th ult., I observe some remarks, under the signature "E. R., Halifax," with details of a conversation on the subject of that manure with a Roxburgh farmer, from which it is inferred that unboiled are preferable to boiled bones. For years back I have been in the habit of using bones largely, and have made trial of both sorts of bones. The result of my experience is, that boiled are infinitely preferable to unboiled bones. The boiled bones I made use of were procured from a large establishment in Aberdeen for the manufacture of soups for exportation, and had been subjected to a thorough boiling. I obtained them whole, and had them ground for myself. The first season I tried them to the extent of 1 ton, and at the rate of 18 bushels per imperial acre; and to test them thoroughly, I applied, beside them, in the same field, and at the same rate per acre, a ton of unboiled bones. The result proved the superiority of the boiled, as I had double the crop of Turnips from them that I had from the other. The two following seasons I increased my supply of boiled bones from 1 to 7 tons; and, had I not found guano a less expensive and equally effective manure, would have given up using any other extraneous manure than boiled bones. Last year I believe these bones were all purchased by the Duke of Richmond's land-steward for Gordon Castle, and it might be desirable to learn the result of his experiments with them. The "hoar-frost" appearance mentioned by the Roxburgh Farmer is no criterion of boiled or unboiled bones. Any one using bones is aware that they are materially affected by the nature of the soil they are used in, and the state of the weather. Here, however, the boiled bones have again the advantage, for they are not to be found entire when the ground is ploughed after Turnip in the ensuing spring, as the unboiled are, being much more easily decomposed. To produce "hoar-frost" in the drill rapidly, however, and at the same time to encourage quick germination of the Turnip-seed, let a little water be added to the bones about 24 hours previous to their being put in the ground, so as to induce a heat, which will materially assist their decomposition, and consequently rapid incorporation with the soil. I ought to mention that these boiled bones were about 12 lbs. per bushel heavier than the unboiled, and, on being heated, gave out a very strong ammoniacal odour.—*A. H., Aberdeenshire.*

Bones.—In your *Gazette* of the 13th inst., Mr. Patrick Clay, Berwick, states that for the last three or four years he has sold large quantities of bones in the counties of Roxburgh and Berwick, and that consequently I have been misinformed as to their going out of use. This I do not altogether admit: it is quite possible that Mr. Clay may have sold large quantities of bones in the two counties; it is also equally possible that in some districts they may be in less repute; my informant merely spoke of his neighbourhood, which is Kelso. My object in making the communication to the *Gazette* of the 13th ult., was to elicit information as to the respective merits of boiled and unboiled bones, and not to bring them into disrepute. If Mr. Clay can give any information on the subject, I have no doubt it will be acceptable to many.—*E. R., Halifax.*

Gorse.—Under the word Gorse in "Withering's Botany," it is mentioned, on the authority of Dr. Evans's tour in Wales, that my father, Mr. Davies, of Llechdwnny, fed a large team of horses on the young shoots of that plant. The fact is, that my father planted 10 acres of very steep land with Gorse seed, and it was cut down and ground in a mill erected for the purpose, the horses invariably preferring it to the best Hay. Dr. Evans was in Carmarthenshire, I believe, in 1802, and it had been the custom then to use the Gorse from time immemorial. One circumstance I must mention:—and Messrs. Rowland and Son ought to know it:—immediately after its use the horses' beards and moustaches grew to an enormous size. —*F. Davies.*

Lime and Salt.—I tried this mixture on two acres of old Grass land, having mixed them in the proportions recommended by Mr. Cuthbert Johnson. A heap was made, and the lime and salt were laid in alternate beds, then mixed up together, and well covered over with soil and sods. After three months this was applied to the meadow in question; it was in a state resembling mortar, and was with difficulty spread; after it became dry, it was beat to pieces, and spread and bush-harrowed. In many parts of the field the Grass appeared as if it was scorched. It did not grow luxuriantly, and the crop was the worst I ever had—in some parts not worth cutting.—*Northumbriensis.* [Possibly too much was applied.]

Analysis of Soils. — The following is a method of analysing soils for ordinary Agricultural purposes:—Weigh a convenient quantity of the earth to be analysed, say 1000 grains dried in the open air; dry the same before a fire on paper, so as not to scorch the paper; re-weigh, and the difference will be the moisture. Roast the residue; re-weigh, and the difference will be the organic matter. Pour a convenient quantity of muriatic acid on the remainder; when stirred and settled pour it off, and add oxalate of ammonia: the precipitate will be the lime. Mix remainder with water, and stir it well; when a little settled, pour off the turbid mixture, and the suspended contents are argillaceous, and the deposit siliceous.—*An Old Subscriber.*

Mangel Wurzel.—It is to be hoped the *Agricultural Gazette* will not patronise the barbarous mode often adopted of spelling this name "Mangold Wurtzel." We allow sailors to transmogrify foreign proper names into words to which they can attach some meaning, and to call the *Ville de Milan* the *Wheel-em-along*, the *Bellerophon* the *Belly-ruffian*, and to distort the beautiful Italian *Livorno* (for they no doubt have first done it) into *Leghorn*; but surely it cannot be necessary that the enlightened Agriculturists of the present day should frame the word Mangel into Man and gold before adopting it. The original and proper German name Mangel Wurzel literally means Want (or Scarcity) root, from its having been found so valuable when there was a deficiency of other food for cattle. And why should we not keep to this correct name, which is intelligible to nearly all the rest of Europe, instead of corrupting it into another which must puzzle them, and is in itself absurd?—*S.* [If our correspondent will examine a German dictionary, he will find that the words "*Beetroot*" are translated there "*Mangold Wurtzel.*" It is possible that "*Mangold*" has had its origin in Germany by some such distortion of "*Mangel*" as those quoted above; if so, the distortion is not chargeable on us. In importing an article from another country, we must just give it the name which it bears there, however ridiculous its origin may have been. The adoption of the word *Mangel* involves, we think, a very questionable theory.]

On the Preservation of Guano.—Guano has been found to exercise wonderful powers in exciting the growth of vegetable life, on nearly every kind of soil, but it is expensive in the first outlay, and to a certain extent it loses its properties by exposure to air and moisture. A few words, therefore, on the means of better preserving it will be useful to such of your readers as use it, and also to those parties who have to keep a large stock on hand for sale. It is well known that this article comes from a climate where it is nearly always dry; it is also known that a great portion of it is soluble in water—a portion containing some of its most fertilising ingredients; hence it must be evident that the exposure to continued moisture, which it receives in England, must wash out the greater part, if not the whole of the soluble matter contained in it, and render it comparatively worthless. It is probably on this account that some parties who have used this manure have found very little benefit from it, and have exclaimed against the new-fangled manures as useless, whereas it has not been the fault of the manure itself, but of the way in which it has been kept—not preserved. In order to keep guano fit for use, it must be preserved in a perfectly dry place, otherwise much useful matter will be washed out. Besides its soluble ingredients, there exists in guano a volatile compound of ammonia, to which it owes its peculiar pungent odour when in a fresh state. Old guano does not possess this pungency in an equal degree, and when very old not at all. The carbonate of ammonia, or common smelling salts of the shops, is the state in which the volatile part of the ammonia exists in this manure. By exposure to the air, even when dry, this compound escapes in the state of vapour, and when wet, is washed out; so that in course of time it is completely lost in either way. Now, as it is well known from the recent researches of Liebig, that ammonia has a wonderful fertilising power, every care ought to be taken to preserve the whole of this compound for the use of the plant, and this can only be accomplished by converting it into a fixed ammoniacal compound, which can be readily and cheaply done by the addition of about 30 lbs. of sulphuric acid (oil of vitriol), mixed with about twice its weight of water, to one ton of guano. A small excess of the acid will not be injurious, as it renders the phosphates soluble, which are not so in simple water, thus enabling them to enter by absorption into the rootlets of any plants to which they might be applied. From the remarks made, it appears that but two very simple conditions are requisite for the preservation of guano, for any length of time, in a state fit for use: the one condition being absence of moisture; the other, the addition of a small quantity of sulphuric acid.—*John Mitchell.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A WEEKLY COUNCIL was held at the Society's House in Hanover-square, on Wednesday last, the 20th of March; present, T. Raymond Baker, Esq., in the Chair; W. R. Browne, Esq.; F. Burke, Esq.; F. C. Cherry, Esq.; E. D. Davenport, Esq.; J. Dean, Esq.; C. G. Dupre, Esq., M.P.; A. E. Fuller, Esq., M.P.; H. Gibbs, Esq.; B. Gibbs, Esq.; Rev. C. E. Keene; W. Miles, Esq., M.P.; H. Price, Esq.; Prof. Sewell, and R. Trench, Esq. The following gentlemen were elected Members of the Society:—

Pearse, Henry, 9, Manchester Square, London.
Parke, Charles, jun., Lower Henbury, Wimborne, Dorset.
Croft, Rev. Richard, Rector of North Ockendon, Romford, Essex.
Eve, William, North Ockendon, Romford, Essex.
Coape, William, Duddington, Stamford, Linc.
Benson, Alan, Papcastle, Cockermouth, Cumberland.
Rees, William, Treharne, Holly House, Newport, Monmouthshire.
Paris, Thomas Greenwood, Barnet, Herts.
Twitchen, Andrew, North Oakley, Kingsclere, Hants.
Stratton, William, Laverstock, Overton, Hants.

The names of 15 candidates for election at the next Meeting were then read.

BURNT CLAY.—His Grace the Duke of Richmond having transmitted to the Council the results of Mr. Page's experience in the application of burnt clay, the communication was read to the Meeting. The report stated the length of time during which the burnt clay had been used on the farm, the mode in which it had been prepared, the quantity applied to the land, the time of year, and to what crops; concluding with the following statement of its effects:—"I have known," says Mr. Page's servant, "that in a wet cold season it beats all other manure for Turnips: of course, it keeps our stiff lands from congealing together, giving the seed more power to vegetate stronger. I never earthed any without seeing an improvement made. All I can say about it is, that it certainly answers on wet cold lands: it will increase the Barley crop 2 coombs per acre. I do not think it answers so well for Wheat as for Barley. It has been used on the farm for 20 years upon a small scale, but for the last six years very plentifully: last year, had the season allowed me, I should have burned 600 loads."

MODEL EXPERIMENTS.—Mr. Miles, M.P., informed the Council, that Mr. Pusey, in his capacity of chairman of the Journal Committee, being desirous that as much practical matter as possible should be communicated to the Society, and under such a uniform statement of the plan adopted, as would lead to direct inferences on a comparison of the results obtained, had suggested to the Journal Committee that a prize should be given to promote that object, a proposition that had been unanimously adopted by the Committee, and of which the details would in a short time be laid before the Council, and the conditions of the prize made public. Mr. Miles was anxious to see the model experiment on the growth of Turnips, which on a former occasion had been recommended by the Council to those members of the Society who had the means and opportunity for engaging in such inquiries, repeated on an extended scale, embracing in its plan not only a trial of the different manures on a root crop, such as that of Turnips, but also on a grain crop, as, for instance, that of Barley, made on not less than an acre of ground, and weighing the produce of not less than half an acre: the trial being tested not only by the resulting weight of Turnips, but also by that of the Barley. He thought that such an experiment would be important and interesting in many points of view; and as it would be desirable that in this, as in the former model experiment, the seed should be obtained from a given and genuine source. He then gave notice that the attention of the Council having been called to the circumstance of there being at present no duly appointed seedsmen to the Society, he should move at the next Monthly Council, that Messrs. Thomas Gibbs and Co., of Halfmoon-street, Piccadilly, the parties who had always been engaged by the Society to furnish seed for the model experiment, and to test by cultivation the various samples of seeds and plants from time to time referred to them by the Council, should be officially appointed the seedsmen to the Society. The Council then adjourned to Wednesday next, the 27th inst.

SOUTHAMPTON MEETING.—A Meeting of the General Southampton Committee was held on Thursday last, Colonel Challoner, Vice-Chairman, in the Chair; at which the recommendations of the Committee respecting the plans for the Pavilion and Show-yards at the ensuing country Meeting in July, were finally determined upon, and ordered to be reported for confirmation to the Monthly Meeting of the Council on the 3rd of April next.

ROYAL DUBLIN SOCIETY.

AT the last meeting of the Society, H. Kemmis, V.P., in the chair, it was reported from the Agricultural Committee, that Professor Dick, of Edinburgh, has kindly undertaken to come to Dublin in April, to deliver lectures on the diseases of cattle, at the approaching Show. It is also hoped that Professor Kane will deliver, on one of the days of the Cattle Show, a lecture on the relations of science to agriculture, and the practical benefits derivable from its application.

HIGHLAND AND AGRICULTURAL SOCIETY.

AT the late monthly meeting of this Society, the first paper read was a Report of Experiments with Manures by Mr. Finnie of Swanston, near Edinburgh, at an elevation of 600 feet above the level of the sea. Oats, Barley, Tares, Grass, and Turnips were tried with about a dozen manures. The cost of all the fertilisers, with the exception of common salt and ammoniacal liquor, was 24*s.* per acre each, as that sum was considered a sufficiently large expenditure for any farmer to incur for such purposes. The amount of produce obtained from the ordinary state of the land was made the standard of comparison with that obtained from the use of the fertilisers. The results obtained were the following per imperial acre:—

	Gain	Loss
OATS.		
Ground Rape cake		£0 5 11½
Ammoniacal salts	£0 7 3	
Common salt	0 13 10	
Nitrate of soda and sulphate of soda	1 6 10	
Nitrate of soda	1 15 4	
Foreign guano	3 19 8	
Artificial guano	3 3 8	
Bones dissolved in sulphuric acid	0 4 2½	
Ammoniacal liquid		0 8 1½
BARLEY.		
Saltpetre		0 15 5
Nitrate of soda and common salt	0 8 6	
Common salt		0 6 9½
Foreign guano		0 1 9½
Artificial guano		0 19 6½
Bones dissolved in sulphuric acid		1 0 3½
Humus	0 2 1	
Ammoniacal salts	1 7 4½	
Nitrate of soda	1 8 4½	
Ground Rape cake	0 6 11½	
TARES.		
Gypsum		1 1 3½
Foreign guano		0 10 11
Artificial guano		0 13 6½
Nitrate of soda		0 5 0½
Humus		0 8 2½
Nitrate of soda and sulphate of soda	0 1 0	
Sulphate of soda		0 15 1½
Bones dissolved in sulphuric acid		1 1 4½
Ammoniacal salts	0 1 4½	
Ground Rape cake		0 12 7½

The fertilisers applied to the Turnip-crop cost 1*l.* 12*s.* per imperial acre, in addition to 12 tons of well-made farm-yard manure, the land which received no fertilisers being manured with 16 tons; so that the value of the

produce obtained from the fertilisers was set against that obtained from 4 tons of farm-yard dung.

	Gain in bulbs	Loss in bulbs
Turnips.		
Bone dust	£0 13 0¾	
Sulphate of soda		£1 9 11½
Burned bones		2 1 11½
Rape dust kept over year		0 5 11½
Second quality of Rape dust	0 6 0¾	
Best quality of Rape dust	2 8 1	
Inferior Linseed cake	1 10 0¾	
Bones dissolved in sulphuric acid	0 18 0¾	
Humus	0 11 0¾	
Artificial guano	0 0 0	
Nitrate of soda		0 12 0
Ammoniacal salts	3 18 0¾	
Foreign guano	2 8 1	
Grass.		
Sulphate of soda		0 0 10
Common salt	0 0 7½	
Nitrate of soda	2 18 8	
Foreign guano	1 0 10½	
Concentrated manure		0 5 7¾
Ammoniacal salts	0 16 10½	
Sulphate of ammonia	1 8 5½	
Refuse saltpetre from powder-mills	3 2 5½	
Muriate of ammonia	0 12 8½	
Sulphate of magnesia		1 4 0
Saltpetre	0 11 9	
Soot, 30 bolls of 4 bush., at 1s. per boll	3 2 6	

Papers on Sheep-washing and Irrigation were then read. The last communication consisted of reports of trials made at the request of the Society by farmers in different parts of the country, of certain varieties of Wheat, which had been decided to be the best in a competition that took place in Edinburgh in 1842, and the comparison thus obtained was not only to be in respect of the recommended Wheats themselves, but also with varieties usually raised in the part of the country in which the experiments were made. The varieties of Wheat selected by the Society for the trials were white Dantzig woolly-eared, Pearl, and Chidham; and of red varieties, Belgian red and Blood red. To Mr. Dickson, near Edinburgh, was assigned the three white varieties, namely, Dantzig woolly-eared, Pearl, and Chidham; and they were compared with the following varieties: Short cluster, Chidham, Hunter's, Hopetoun, Belgian red, White Essex, and Fenton; and the results obtained from these were as follows per Scotch acre in value and quantity, viz.:—

	Bushels per acre	lbs. per Bushel	Value of Corn and Straw
Dantzig, woolly-eared	55	65	£26 4 0
Pearl ,,	47	65½	23 16 3
Chidham ,,	49	65½	23 13 11½
Short-cluster ,,	47	64½	22 4 1
Chidham ,,	52	65½	25 4 5
Hunter's ,,	48	65½	24 1 1
Hopetoun ,,	49	64½	23 5 5
Belgian Red ,,	53	64½	24 2 11
White Essex ,,	46	65½	22 19 6
Fenton ,,	57	64	24 13 0

To Mr. Ritchie, of Alloa, were also assigned the three above-named white varieties, and with them he compared Hopetoun, Hunter's, and Whittington, and the results per Scotch acre obtained by him were as follows:—

	Bushels	lbs. per Bushel	Value of Corn and Straw
Chidham ,,	33	64	£17 7 9
Pearl ,,	40	60	15 0 4
Dantzig woolly-eared	37	63	15 15 10½
Hopetoun ,,	41	62	17 13 4½
Hunter's ,,	43½	61½	19 1 2
Whittington ,,	36	62	16 9 5

These two statements may be correctly compared, as they indicate the results per Scotch acre. Mr. Allan, Berkshire, conducted the experiments with the red varieties, and compared them with Hunter's, and he obtained these results per imperial acre:—

Blood Red, rather more than 34½ bush., 57 lbs. per bush.
Belgian Red ,, 35½ — 57 ,,
Hunter's, rather less than 43½ — 57½ ,,

Among the donations sent to the Society was a small packet of African guano, from Mr. James Bell, of Liverpool, obtained from the first cargo, per the Levenside, of 300 tons, that has just arrived in Scotland. The cargo, it seems, has been offered at auction, and 8*l.* 2*s.* 6*d.* per ton refused, but offered at 9*l.*, and but little had been sold at that price. Mr. Bell is of opinion that a large quantity of the manure will be imported. The Society has requested Professor Johnston to analyse this guano, and compare it with the Peruvian.

FARMERS' CLUBS.

Debenham.—The subject of artificial manures was discussed at the meeting of this club on the 2d inst. The gentleman who introduced the subject said, that last year he had tried several kinds of artificial manure to a small extent, with a view of testing their comparative fertilising qualities, and from the success he had had with some, he was induced to increase his expenditure this year to 30*l.* Last year he was of opinion he applied the different artificial manures too late (the latter part of April); this year he should commence immediately. He had tried guano, gypsum, nitrate of soda, saltpetre, and urate. Last year he top-dressed a piece of Wheat (every other ridge) with 2½ cwt. of guano per acre, at a cost of 28*s.* per acre; he had taken with the greatest care an equal quantity (by measure) of the produce where top-dressed and where not top-dressed, and having had them kept and threshed separately, he found there was an increase of eleven bushels per acre where he had applied the guano, beyond the produce of that where no guano was applied, and a proportionate increase of Straw. From a top-dressing of one cwt. of nitrate of soda applied to Wheat, alternate ridges, he had an increase of six bushels per acre, cost per acre 26*s.*; from saltpetre about the like increase—but the cost per acre more than for soda: with both soda and saltpetre there was an increase of Straw. He had applied urate at the rate of 5½ cwt. per acre, cost 28*s.* per acre, but without benefit from its use. He had also tried an experiment with the above manures on Clover last year, each at an equal cost per acre; he had sown two ridges with guano and gypsum, two with guano alone, two with gypsum alone, and two with urate alone. He had the greatest produce from the guano and gypsum;—from guano alone, good; from gypsum alone, good; from urate, not so good as from the other artificial manures. He believed the produce from the guano and gypsum was double, compared with the other part of the field where no manure whatever had been applied.—Another member stated he had had a small quantity of guano sent to him last year, with directions for sowing, which he strictly complied with. He top-dressed a spot in his Turnips, which were up and fit for the hoe; it was a decided failure—indeed, the Turnips so top-dressed were the worst in the field. He had also used a small quantity on Grass land; the effects were soon visible; the Grass there soon outgrew the rest of the field, for which there was a good reason—the cattle grazing therein would not eat the grass when top-dressed with guano, it was so very rank; thinks probably too much was applied, or that it ought to have been mixed with ashes or mould; he had used nitrate of soda as a top-dressing for Grass land, which produced a visible increase.—Another member said he had used soot as a top-dressing for Wheat, and found an increase in the quantity both of Straw and Grain. He had watched an application of rape cake, burnt earth, and farm-yard manure, for Turnips; the proportion used was as follows:—rape cake one third of a ton per acre, drilled in with the seed; 90 bushels burnt earth, also drilled; and about 15 chaldrons per acre of farm-yard manure; the other part of the field was manured with pig manure, and from it the best Turnips were obtained; the next best, where the rape cake was applied; from the common farm-yard manure and burnt earth, the Turnips were about equal. He had also examined the Barley which succeeded the Turnips; the pig manure had the preference, then the rape cake, then the farm-yard manure; the burnt earth appeared there to have lost its power.—Another member said he had seen a field of Turnips where the occupier had manured with the best bullock-yard manure, which, falling short, he had finished the field with rape cake; where the rape cake was used there were two thirds more Turnips than where the bullock-yard manure was applied.—Another member said he had top-dressed part of a field of Wheat with soot, about 25 bushels per acre, from which the increase was four bushels per acre.—As but few artificial manures had been tried, and those only to a small extent, it was thought advisable by the club not to come to any resolution on the subject this evening, but from what had been stated, it was hoped many of the members would be induced to try as many of the artificial manures as convenient, both as top-dressings for Wheat, and also for Clover and Grasses, and that they would report the results of such experiments to some future meeting of the club.—*Wm. Green, Secretary.*

Collingham.—At the meeting of this Club, held the 5th March, J. S. Woolley, Esq., jun., came forward to explain his method of keeping Farmers' Accounts. The system is principally this,—he has two books, a journal and ledger; the journal is for one year, and contains 52 pages, one for each week; half of each page is occupied by a daily journal of labour, the other page is divided into three parts, one for the stock account, another for the corn account, and a third for the cash account, which is an account of all receipts and expenditure not coming under the head of labour, stock, or corn. The ledger then is divided into four parts, ruled double; the first is occupied by a common cash account, which receives the weekly receipts and expenditure in labour, stock, corn, &c., and at the end of the month is balanced and carried into the ledger, or second part of this book; the third part is appropriated to the yearly valuation, and the fourth is to be occupied by all debts due to and from the farm, such as cake and bone bills, rent and taxes, &c. The meeting was numerously attended, and the members expressed their satisfaction in the proposed plan.—*Robert M. Wright, Secretary.*

Reviews.

Report of the Judges appointed to inspect the Farms entered for the Prize and Sweepstakes proposed by the Yorkshire Agricultural Society. 1843. J. Coultas. York.

(*Continued from page* 174.)

"Godfrey Wentworth, Esq. [who received the second premium], has occupied his Woolley-park farm about 14 years. The four-course rotation of green crops, Barley, seeds, and Wheat, is here adopted; a variation being occasionally effected by the introduction of Beans or Tares on portions of land that would otherwise have been sown with pasture-grasses or Clover after the Barley-crop.

"*Turnips and Fallow Crops.*—The preparation for these commences as soon as the Corn is carried, by ploughing and harrowing the stubbles as much and as often as the weather permits—making the last ploughing deep to give the greatest exposure of the soil during the winter. The manure is led from the farm-yard in December and February; placed in a convenient and level site on a layer of earth, and protected from the air by a light covering of the same. For these crops the manure is conveyed by one-horse carts, up the centre of each third drill, as soon as the drills are formed, and care is taken to spread it equally and quickly that it may be covered in with the least exposure to wind and sun. The drills for Potatoes are 30 inches apart; for Mangel-wurzel 27 inches; Carrots and Swede Turnips 25 inches. We found all these crops extremely promising and remarkably clean. They had been sown about the 8th of May; 6 lbs. of Mangel-wurzel, 4lbs. of white Belgium Carrot-seed, and 3 lbs. of Swedes were sown per acre; 15 carts of manure per acre, were allowed for these crops. One-half of the Swedes are carted to the farmyard for the cattle by removing six rows alternately; but to supply the drain thus made upon the land, a quarter of a pound of Linseed-cake per head is daily given to the sheep when consuming the remainder. For the white Turnips, which are all consumed upon the land, only 10 cart-loads of manure are allowed.

"*Grass Land.*—The management of this department is admirable. The average stock of Leicester sheep is 550; of short-horned cattle, 40, all of a very superior breed, and in high condition. There being 76 acres of good permanent Grass-land upon this farm, the heaviest cattle are pastured upon it, with a smaller proportion of sheep. The younger stock are principally maintained with the ewes and lambs upon the seeds. Much pains is taken to make compost on a large scale, which is applied to the Grass-land in the autumn, winter, and spring. Thistles and other weeds are carefully kept down. Nine farm-horses are kept."

This is a most extraordinary stock for a farm of 255 acres, of which 76 are permanently pasture, and 50 in Clover-seeds.

"The next farm, Mr. Newham's, of Edlington, afforded us great interest. As a tenant-farmer he is peculiarly liberal in his management, both by consuming Linseed-cake, to a great extent, and purchasing bones, as the following account, which he delivered to us, of his consumption of these articles for the last four years will show:

Year.	Tons of Oil-cake consumed.	Bushels of Bones consumed.	Cost of Bones
1839	12	1200	£157 10 0
1840	16	1 00	151 5 0

"His sheep, from the period of weaning from the ewes to the time of their sale when fat, whether on Turnips or Grass, have always a full supply of oil-cake, be the pasture good or closely eaten. His opinion is, that the extra produce of beef and mutton pays for the cake, and that he obtains the prodigious benefit of the superior manure without cost. Certainly the land gains much by the application of linseed-cake, as food for cattle, and we never met with an instance where so much was consumed on a farm of scarcely 300 acres.

"This year, two acres of Lucerne and two acres of Sainfoin, have been sown close to the farmstead, for the purpose of soiling. Ten regular draught-horses are employed; the practice is to purchase annually two, of two years old, and sell out two of seven years old, thus keeping the stock always young. The ewes kept on the farm, on the average of the three last years, have been 122; lambs bred from them, 151, which are sold fat, when shearlings; and in addition to this stock, from 250 to 300 shearlings are bought each September, put upon Turnips, and sold fat in the spring. Mr. Newham also fattens about 20 bullocks every winter in the yards with linseed cake, holding besides about 20 cattle of various ages. It is chiefly from the vast supply of first-rate manure, made from these causes, and the liberal purchase of bones, that the high condition of Mr. Newham's farm has been obtained. He adopts the four-course of Turnips, Corn, Clover, and Corn, varying the Corn crops, but often taking two crops of Wheat in a course, and sometimes substituting Beans in the place of red Clover. His mixture for one year's pasture is ten pounds of white Clover, ten pounds of Trefoil, four pounds of Rib-grass, four pounds of Parsley, and a quarter of a peck of Rye-grass per acre.

"Mr. Snowden, of Marr, who has occupied his farm 15 years, has also practised a course of cropping somewhat similar to that followed by Mr. Newham. He sows Swedes 22 inches apart, allowing nine carts of well-rotten farm-yard manure per acre for the rows, on which he also drills 10 bushels of bones, 6 bushels of pigeon-manure, 8 gallons of whale-blubber, and 10 bushels of ashes, all mixed together. Estimating the farm manure at 10*s.* a cart, the cost of manure per acre for the Swedes is about 6*l.* More than half this crop is carted to the farm-yard, for cattle, and not many are eaten on the Grass-land. The white Turnips have 24 bushels of bones, and 10 bushels of ashes drilled, with two pounds of seed; these Turnips are seldom drawn."

The concluding remarks of this valuable report are well worthy the attention of Agricultural societies.

"In closing our report, we may perhaps be permitted to remark, that valuable as large Agricultural meetings for the exhibition of stock and implements are, on account of the opportunities which they afford for obtaining a knowledge of the excellences to be aimed at by the breeder and the grazier; and the improvement of machinery, which these exhibitions have mainly encouraged, yet the minute inspection of well-cultivated farms, is not less worthy the attention of the arable farmer. We are of opinion that the produce of grain would be much more than doubled, and that the profit of the cultivators would be greatly increased, if the praiseworthy examples set on the farms we inspected were generally followed. An inquiring mind is necessary to form a perfect, or even a successful farmer. The best-informed farmer would, on each of these seven farms, discern that he had something yet to learn, and would see some practice from which to improve his own."

An apology would have been necessary for extracting so large a portion of a published work, had it not been

that in thus giving circulation to its contents we are simply meeting the desire of the society to whom it belongs.

The Value of Landed Property demonstrated by Practical Deductions and Illustrations, tending especially to facilitate the valuation of estates as applicable to the purposes of Agriculture. By Layton Cooke, Esq., Land-Surveyor, chairman of the Committee of Agriculture of the Society of Arts, Manufactures, and Commerce, London. Published by the Author, 7, John-st., Adelphi, London.

We have not space at present for more than a short notice of this work, but we hope to be able soon to direct the attention of our readers in detail to some of the important subjects of which it treats. Mr. Cooke has had a lengthened experience as a land-surveyor; indeed, it may be seen from a perusal of this work that it was written by a practical man. Besides a detail of all the points which affect the value of land, and illustrations of the mode in which they act, it contains numerous tables, showing the amount of the influence which each exerts under given circumstances. The contents of this work were first "arranged for the author's private reference, and for the purpose of conveying to his pupils a correct idea of the principles which should regulate the practice of valuing land;" and by its publication he has made known "a rational and intelligible mode of valuing," which will promote what is much to be desired—uniformity in practice.

Miscellaneous.

Rotation of Crops for Heavy Clays.—My course of crops is as follows, viz., one-fourth Wheat; after that Oats, one-half of which is sown alternately with Clover; after that, sown with Winter Tares, eaten off green by fatting sheep; then a bastard fallow for Wheat—the other half fallowed for Turnips, part eaten on the land and part drawn off; then fallowed for Spring Tares or Coleseed, eaten off by fatting sheep; then ready for Wheat again. For example, say if the farm be 200 acres of arable land—

50	acres	Wheat
50	,,	Oats
25	,,	Winter Tares
25	,,	Fallow for Turnips
25	,,	Clover
25	,,	Coleseed and Tares
200	acres	

This is a system I have used for some years on strong retentive clay-soil, which I have found answer well.—*Mr. Nowlson, English Agricultural Society's Journal.*

The Highland and Agricultural Society of Scotland have fixed on Dumfries as the scene of their Show for 1845.

Ventilation of Cowhouses.—Every one knows that pure air is necessary for respiration, and that air on being used by the lungs is expelled in a deteriorated condition, and rendered unfit for being again inhaled. If, therefore, cowhouses are not properly ventilated, the air becomes foul from the respired air, as well as, perhaps, from impure exhalations, and the air so deteriorated is rendered unfit to maintain health. In the neighbourhood of large towns, too, there is another predisposing cause to disease, viz., the unnatural forcing of a cow's milk by a too liberal supply of brewer's draff. Fresh supplies of air, that the blood may be purified, are essential objects of a respiratory apparatus, and if the blood that goes to the lungs is returned to the system in the same state as it is sent, death will be the consequence, for venous blood is poison to the body. It does not often happen that imperfect ventilation produces immediate death, but it is too often the real cause of inflammation, fever, and deadly distempers.—*Correspondent of Mark Lane Express.*

Guano on Turnips and Potatoes.—Having since your meeting tried the weight of our Turnips on the different manures, I find them as here annexed, per Scotch acre:—

	Tns.	cwt.	qrs.	lbs.
1. Sowed 19th May, 30 bushels bones, produced	26	3	1	10
2. Sowed 19th May, 15 bushels bones, and 2½ cwt. guano, produced	34	52	1	14
3. Sowed 19th May, 5 cwts. guano	30	16	0	16
4. Sowed 19th May, 40 tons farm-yard manure	33	15	1	4

The above variety were all Laing's Purple-top Swede. The bones and guano came away first, and kept ahead. The soil is heavy clay: all were furrowed, drained, and limed at the rate of 50 barrels per acre. We have another field manured with 45 tons farm-yard manure per acre, which has produced 40 tons, 2 qrs., 24 lbs. The soil is a middling loam; the variety green-top Swede. The Potatoes I mentioned at your meeting were planted on the 4th and 5th of May. The six acres produced 40 tons, farm-yard manure. On the 9th and 10th of May I planted six acres with 5 cwt. guano mixed with four times the weight of coal-ashes; the drills made light, and the guano put in the bottom, and the Potatoes planted on it. The difference of crop when raised was not perceptible, both averaging 12½ tons per acre; the Potatoes mostly cups; the soil heavy clay; but all drained, subsoiled, and limed, and after two Corn crops.—*Andrew Templeton, of Ballyleidy, to the Secretary of the Holywood Agricultural Society.—Belfast Paper.*

Pea-straw.—At a lecture of the Rev. Mr. Sidney, at Acle, Norfolk, the rev. gentleman drew attention to the waste of Bean and Pea-straw. It was cut too late. He gave the analysis of each as to nitrogen and gluten, which showed that 74lbs. of Pea-straw, and probably of Bean-straw also, equalled in nutriment 100lbs. of common hay—a fact most important for farmers here, and well known in Scotland.

Fermentation in Manure-Heap.—When a piece of paper, moistened with spirit of salt, or muriatic acid, held over the steams arising from a dunghill, gives dense fumes, it is a certain test that decomposition is going too far; for this indicates that ammonia is not only formed, but is escaping.—*Smith's Productive Farming.*

Notices to Correspondents.

Carrot-tops.—*Vigil.*—They form a good feed for horses; but we have *experienced* the injury to the root that arises from thus cutting the plant.

Churn.—*Clericus.*—Milk is said to be a solvent of zinc, and zinc vessels for holding it are therefore dangerous. The churn you mention is highly spoken of; we think it is made of tin, which is perfectly safe.

Cloacine.—*A. W.*—You may disinfect it by the use of chloride of lime. Apply to any manufacturing chemist. Mixing with charcoal-dust will improve it, and dry it; but why wait till it is dry before mixing it with your peat? Your compost, which you may make at once for use in May, will be sufficient manuring in the quantity you propose per acre for Swedes. Good guano is more valuable, weight for weight, than night-soil.

Concrete Tiles.—*F. C.*—The price, as you will find on making the calculation, ought to have been 13*s.* per 1000 tiles. 2500 tiles are made of one ton of lime, half a ton of black cinders, four tons of common sand, two tons of fine gravel. The two latter are ground together wet, and the other materials afterwards added. More particularly, hereafter, in the course of a series of articles on the subject.

Deep Drilling.—*A Surrey Subscriber* had better apply to Mr. Hornsby, of Grantham, Lincolnshire, on this subject.

Direction of Drills.—*Sussex Farmer.*—We drill our Wheat up and down the hill without reference to the points of the compass. If your ridges are well rounded, it is well, if the fall of the land will permit, that they should run north and south, as both sides will then get an equal share of the sun; and the drills may be either across or down the ridges, according to the degree of the fall. The same rules apply to spring Corn.

Draining-plough.—*D. Pugh.*—We shall be able to give you information on this subject in detail shortly.

Furze.—*P. B. B.*—It will ultimately become dead below, and very open. The plant will spread, too, by seed. A Thornfence may be hidden by evergreens at intervals, so as to render its appearance ornamental. The sediment of rivers would be a useful top-dressing for light soils. The mud of roads is useful as an ingredient of the compost-heap; mix it with farmyard manure.

Grass-seeds.—*Gramineæ.*—Mr. Lawson, in his "Agriculturist's Manual," recommends for deep mossy ground per acre, intended to lie in Grass, Agrostis stolonifera, 2 lbs.; Alopecurus pratensis, 2 lbs.; Festuca duriuscula, 2 lbs.: Lolium perenne, 6 lbs.; L. Italicum, 3 lbs.; Phleum pratense, 2½ lbs.; Poa trivialis, 2½ lbs.; Trifolium repens, 6 lbs.; Lotus major, 1½ lbs.; and Rye, 1 bushel.

Guano.—*Vigil.*—The addition of gypsum to guano *may* benefit it, and certainly *will not* injure it. It will probably make it a better top-dressing for Clover.

Linseed for Calves.—*M. P. S. T.*—Boil 1 pint in a gallon of water; you need not soak it in water first. Give your calves from 1 pint to 1 quart of the jelly daily, according to their age. Give 1 pint to horses along with their Chaff, &c., twice a day. It will not improve the milk, if given as food to cows.

Liquid Manure.—*W. B. W.*—40 bushels of soot are sufficient of an excellent manure for an acre. It may be advantageously applied as you propose. We apply liquid manure in a water-cart. If the land be dry, the marks of the wheels are no injury. Perhaps Mr. Booth will inform you the way in which he applies it.——*Amicus.*—Use it unadulterated in wet weather, and dilute it with, say an equal bulk of water, in dry weather. Potter's Guano is an excellent manure; you can apply it after the rate of 2 to 4 cwts. per acre.

Nitrate of Soda.—*W. Northumbriensis.*—Decomposition, were it in the soil possible, probably would not injure it. You may apply it on newly-limed land, without chance of decomposition.

Permanent Grass.—*Three Years' Subscriber.*—Mr. Lawson recommends for light land shaded with trees, Agrostis vulgaris, 1 lb.; Anthoxanthum odoratum, 1 lb.; Dactylis glomerata, 5 lbs.; Lolium perenne, 8 lbs.; Poa nemoralis, 4 lbs.; P. trivialis, 2 lbs.; Trifolium repens, 3 lbs.; with an ordinary seeding of Barley.

Permanent Pasture.—*J. B.*—April is the proper time to sow Grass-seeds. You can sow them safely enough with an ordinary seeding of Barley, unless your land is liable to grow much straw.

Points of a Milch Cow.—*G.*—We know what you allude to, and will endeavour to obtain the pamphlet.

Potatoes.—*H. C. S.*—Mix 3 cwt. per acre of guano thoroughly with the soil before planting. It will not injure your young trees, if well mixed with the soil. We shall be glad to see your account of Prickly Comfrey.

Seeds.—*A. B. C.*—If your field is only to remain 1 year in seeds, Italian Rye-Grass is useful, on account of its rapid growth, for filling up patches that have failed. The Yoxford Farmers' Club recommends Tares at the rate of 1 bushel an acre, to be sown when the blanks have not been noticed till spring.

Sulphuric Acid and Bone-dust.—*York Subscriber.*—We doubt the propriety of drying this mixture with quicklime. Rather take ashes, charcoal-dust, &c.; and on mixing these in sufficient quantity, you can get it to pass through the drill. Please send a specimen of your guano.

*** As usual, many communications have been received too late.

Markets.

SMITHFIELD, Monday, March 18.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3*s*	8 to 4*s*	0	Best Downs & Half-breds	4*s*	2 to 4*s*	6
Best Short Horns	3	4	3	8	Best Long-wools	4	0	4	4
Second quality Beasts	3	0	3	4	Ewes and second quality	3	6	4	0
Calves	4	4	5	0	Pigs	3	8	4	4

Beasts, 3003; Sheep and Lambs, 23,230; Calves, 63; Pigs, 375.

We have to-day a very large increase in the supply of Beasts. Although the weather is remarkably fine, and there is a good attendance of buyers, the quantity obliges us to submit to a reduction of prices. Not only is the number larger, but the Beasts are in much finer condition than we have noticed for some time, thus there is a very great weight of meat in market. The best and most selling Scots, &c. are making 4*s*, but very many not quite so complete are sold at 3*s* 10*d*, and Short-horns are not a ready sale at 3*s* 8*d* per 8 lbs. The supply of Sheep continues very short, and the trade steady, at fully as much money; there is a slight improvement in the best Downs, but scarcely a quotable one. There are a few Lambs in to-day, but the trade for them is very dull; a nice small Lamb is worth from 5*s* 8*d* to 6*s* per 8 lbs. Calves and Pigs are a steady trade at former rates.

Friday, March 22.

The trade to-day is excessively heavy. Beef almost generally suffers a decline of nearly 2*d* per 8 lbs; only the very best selling Scots may be said to maintain Monday's quotation—they still realise about 4*s* per 8 lbs. The Sheep trade is very heavy, but the best Downs are still worth 4*s* 6*d*; other qualities are fully 2*d* per 8 lbs lower than Monday. Lamb is more in request, although it is too early and cold for any extensive dealings in that article; small Lambs of good quality are making from 5*s* 8*d* to 6*s* 4*d*. Calves are heavy, at from 4*s* to 4*s* 10*d*. The Pork trade is also very dull, but we cannot observe any alteration in prices.

Beasts, 794; Sheep and Lambs, 3200; Calves, 138; Pigs, 320.

41, West Smithfield.

HOPS, Friday, March 22.

The Hop Market remains steady at full last week's currency.

Joshua Baker, Hay Salesman.

MARK LANE, Friday, March 22.—A few runs of Essex and Kent Wheat remain unsold, and Monday's prices cannot be obtained by 2*s.* per qr. Free Foreign is a moderate sale at the same rates. There has been a slight inquiry for Bonded, principally Red Wheat, and a little business has been done in Rostock and Polish Odessa, f. o. b. at rather reduced prices.—Barley is dull, but not cheaper.—Peas and Beans continue the same.—Oats are flat, but there is no alteration in value.

Kingsford and Lay.

COVENT GARDEN, March 23.—In consequence of the weather during the week having been cold and changeable there has been little new in the Market since our last Report. It has, however, been pretty well supplied, and trade begins to get brisk. The prices of Pine Apples are nearly the same as last week; they are good in quality and sufficient for the demand. Hot-house Grapes are offered at 15*s.* per lb.; they are scarce, but Portugals are plentiful. The prices of Apples and Pears are nearly the same as are mentioned in last week's Report. Oranges and Lemons are sufficient for the demand, and are not altered in price. Chesnuts are offered at from 3*s.* to 8*s.* per peck. Nuts are plentiful. Vegetables have been pretty well supplied. Broccoli is a little reduced in price. Savoys continue to get scarce, and Brussels Sprouts are not plentiful. Greens are also beginning to get scarce. Carrots and Turnips are good and plentiful. Sea-kale is slightly reduced in price, as is likewise Asparagus; the latter is selling at from 3*s.* to 15*s.* per 100. French Beans are nearly the same as last week. We noticed some excellent Rhubarb in the market, and also a few good specimens of large well-formed Cucumbers. Frame Potatoes are offered at 3*s.* per lb.; and Strawberries are selling at 2*s.* an ounce. Among Cut Flowers were Erica Willmoreana, princeps, and rubra-calyx; Gardenia radicans and florida; Gnidia pinifolia, Acacias, Azaleas, Camellias, Pelargoniums, Cinerarias, Primulas, Fuchsias, and Roses.

Fruits.

Carrots, p. doz. bun., 2*s* 6*d* to 5*s*	Scorzonera, per bundle, 1*s* to 1*s* 6*d*
Cucumbers, 1*s* to 4*s* 6*d* each	

POTATOES.—Southwark Waterside, March 18.

In consequence of the very limited supply during the past week, the best samples have gone off readily, and every description have been eagerly sought after, and some fresh arrivals the latter part of the week brought an advanced price; at the close, the subjoined rates were fully supported. The weather continues favourable for the consumption of Potatoes, and is calculated to backen vegetation.

Mark Fortnerghtl.

J. G. WAITE, SEEDSMAN, &c, 1 & 4, Eyre-street-hill, Hatton-garden, London, embraces the present opportunity of returning his best thanks for the very liberal support he has received, and to assure his friends that his exertions will at all times be used to deserve a continuance of that preference with which he has been so highly honoured.

J. G. W. most respectfully reminds the public that the seed time is rapidly advancing, and many of the following articles will now be in requisition.

		s.	d.
Waite's Queen of Dwarf Peas	per quart	21	0
[A splendid new variety, growing only one foot high, producing a larger pod than any of the same habit; the seed is quite distinct from all others, and larger than any dwarf Pea in cultivation. The stock is limited to a few quarts.]

,, Green Tankard	.	0	8
,, New Zealand Golden Melon Swede	.	0	9
,, New White Decanter		0	9

Parties wishing to buy by the bushel may have a priced Catalogue on application.

IMPORTANT TO MARKET GARDENERS.

J. G. WAITE can supply sufficient ONION SEED (any sort) to sow an acre for *1l*. 10*s*.; he furnished many large Growers last season, and several of them had as many as 600 bushels to the acre. J. G. W., from his long experience as a grower for the London Markets, recommends the above plan as the most economical.

J. G. W.'s INCOMPARABLE HARDY GREEN COLEWORT is by far the best in cultivation; it turns into heart before all others, stands the frost well, and continues in use till the Spring Cabbages come in. Time of sowing, April till July. Price 5*s*. per lb.

N.B.—Cash, or a respectable reference in London, is expected from unknown correspondents.

FLOWER SEEDS—36 Packets, 10*s*.; 18 ditto, 5*s*., forwarded, postage free, to any part.—Apply to Mr. JOHN BROWN, Albion Nursery, Stoke Newington, London. Any preferred species may be specified in the order. Payment by Post-office order or stamps.

J. and H. BROWN have on sale an extensive collection of the most approved Plants for greenhouses and conservatories. Parties building large or small greenhouses can be well supplied.

MANURES FOR WHEAT, &c.

POTTER'S GUANO.—Result of an Experiment on Wheat, tried near Colchester—sown Nov. 1842, reaped August 1843. POTTER'S GUANO.—Seven bushels per acre gave 54¾ bush. Grain. Daniell's Manure, 40 bush. per acre, gave 46 bush. Grain. Difference in favour of POTTER'S GUANO, 8¾ bush.

Note.—The Daniell's Manure cost 3*l*. POTTER'S (present price) 2*l*.—Works 28, Upper Fore-street, Lambeth; sold by M. FOTHERGILL, 40, Upper Thames-street.

BEAUTIFUL FLOWERS.—POTTER'S CONCENTRATED LIQUID GUANO, for Flowers, Kitchen Garden Produce, &c. Sold by appointment, by SAVORY and MOORE, Chemists to the Queen, 136, New Bond-street, and 220, Regent-street, and can be had of most respectable Chemists and Seedsmen. Price 1*s*. 9*d*. the quart bottle, with directions.

DR. LINDLEY, in the *Gardeners' Chronicle* for 1843, p. 560, says—"POTTER'S GUANO will convert your desert into a paradise." And in the Number, Feb. 10, 1844—"POTTER'S GUANO is unrivalled."—Works, 28, Upper Fore-street, Lambeth.

GUANO ON SALE BY THE IMPORTERS,
JOHN BOYD & Co.,
Wellington Chambers, London-bridge, Borough.

GUANO, PERUVIAN, &c.—The above Manures, also Potter's Guano, Nitrates of Soda and Potash, Gypsum, Bone-dust, and all other Chemical Manures of known value may be had of the undersigned, on the best terms, for cash.

Lists of Prices, with Synopsis of mode of use, on application to MARK FOTHERGILL, 40, Upper Thames-street, and 5, Railway Place, Mark-lane, London.

GUANO (GENUINE PERUVIAN & BOLIVIAN)
ON SALE, BY THE ONLY LEGAL IMPORTERS,
ANTONY GIBBS AND SONS, LONDON;
WM. J. MYERS AND CO., LIVERPOOL;
And by their Agents,
COTESWORTH, POWELL, AND PRYOR, LONDON;
GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.
47, Lime-street, March 22, 1844.

PERUVIAN GUANO, of first quality, and in any quantity, direct from the Bonded Stores. Also African Guano and Nitrate of Soda.—Apply to H. ROUNTHWAITE and Co., 6, Cable-street, St. George's Crescent, Liverpool.

TO GARDENERS AND AGRICULTURISTS.

SUPER-PHOSPHATE of LIME is capable of producing a more rapid vegetation in Plants than any substance known. It may be had at Mr. LAWES' Factory, Deptford Creek, price 7*s*. per cwt. Phosphate of Potash, 15*s*. per cwt.
,, Soda. 12*s*. ,,
,, Magnesia 9*s*. ,,
,, Ammonia 1*s*. per lb.

THE URATE of the LONDON MANURE COMPANY, 5*l*. per Ton. It is with the greatest satisfaction, after three years' experience, the Company are enabled to recommend the above as one of the best manures for Barley, Oats, Spring Wheat, and more especially Turnips. By promoting a rapid growth of the latter it secures a full plant, at the same time producing a great weight per acre, and extending its beneficial effects to the succeeding crops. The Urate may be sown broadcast, or which is preferable, by the drill, at the rate of one ton to three acres, and it is desirable it should not be placed more than two inches below the surface. As a top-dressing for Wheat the Urate has been used with great advantage. Gardeners and Florists will find it very useful for Dahlias and other roots. Full particulars and Testimonials will be forwarded on application. Genuine Peruvian Guano; Phosphate and Sulphate of Ammonia; Gypsum and every other artificial Manure.
EDWARD PURSER, Secretary, 40, New Bridge Street.

ASPHALTUM in its pure state, with all the material and instruction how to prepare, or if required, the labour performed at a moderate charge.

TOBACCO ASHES.—A few Tons of Tobacco Ashes to be Sold at 3*l*. per ton, convenient for land or water carriage.—Apply to J. A. HUBBARD and SON, 20, Harp-lane, Tower-street. All Letters prepaid.

CHOICE FLOWERS and PLANTS in POTS.

HUMPHREYS'S COMPOUND, applicable to all Greenhouse Plants, to Seeds, Cucumbers, &c., and to promote the germination of Seeds. Sold in bottles price 1*s*. 9*d*. each, by Messrs. FLANAGAN and SON, Mansion-house-street; WARNER and WARNER, 28, Cornhill; HURST and MCMULLEN, Leadenhall-street; W. CLARK, Bishopsgate-within; SMITH, Islington Nursery; GRIMLEY and Co., Covent Garden; BATT and RUTLEY, 412, Strand; WILLIAM and JOHN NOBLE, Fleet-street; SMITH, Covent Garden; CHARLWOOD, Tavistock-row; W. J. NUTTING, 46, Cheapside; G. LAWRENCE, 18, Piccadilly; JOHN KERNAN, Great Russell-street, Covent Garden; LOCKHART, 156, Cheapside; SHUTTLEWORTH, Pantheon; MINIER, ADAMS, and NASH, 63, Strand; THATCHER and SON, Islington; J. FRYER, Clarendon-terrace, Camberwell; THOMAS ANSELL, Camden Town; THOMAS WATKINSON, Market-place, Manchester; T. S. KING, Rochester; W. E. RENDLE, Plymouth; DICKSON and Co., Edinburgh; PONTEY, Leeds; FISHER, HOLMES, and Co., Sheffield; P. LAWSON and SON, Edinburgh; J. THORNE, Shepton Mallet; and other leading SEEDSMEN in town and country. Wholesale Agents, DAVY, MACKMURDO, and Co., 100, Upper-Thames-street, London.

TO AGRICULTURISTS.

THE Dry Material for making CAMPBELL'S CORN-PRODUCING LIQUIDS, or FERTILISING STEEPS, which have arrested the attention of Agriculturists in all parts of the United Kingdom, is now to be had in Boxes containing quantities for 5 Gallons and upwards, at the following prices:—For WHEAT, Material per Gallon ....2*s*. 6*d*.
,, OATS and GRASSES, ...1 6
,, BARLEY, ...2 0
,, BEANS and PEASE, ...2 6
,, TURNIPS and RAPE SEED 2 6

Agents in London:—Mr. EDWARD PURSER, 40, New Bridge-st.; Messrs. GEO. GIBBS and Co., 26, Down-st., Piccadilly; and Messrs. THOMAS GIBBS and Co., Corner of Half-moon-street, Piccadilly.

TO AGRICULTURISTS.

ENGLAND INDEPENDENT OF THE WORLD FOR CORN.

THE attention of the Agricultural Interest, at this momentous crisis, is requested to the great importance of LIQUID MANURE, and the ease with which it may be appropriated, by the use of FOWLER'S PUMPS, made expressly for the purpose, either portable or fixed; Garden, Ship, and Barge Pumps; also, those for Distillers, Brewers, Soap-boilers, and Tanners, for hot and cold liquor. Pumps kept for Hire, for Excavations and Wells, Buildings heated by hot-water, for Horticulture, and every variety of manufacturing purposes. The trade supplied on advantageous terms, by BENJAMIN FOWLER, Engineer, &c., 63, Dorset street, Fleet-street, London.

AGRICULTURAL IMPROVEMENT.

SPRING WHEAT.—HUMPHREYS'S FARMERS' COMPOUND, manufactured on a *new principle*, so as to present a cheap manure of greater power, and more extensive usefulness, than the guano; and without its caustic rankness, and liability to be washed out of the soil. From its wholesome character, it is unrivalled for garden culture; and as a Top-Dressing for all Spring Crops. Per acre, for WHEAT, BARLEY, &c., with a bad soil, *Five cwt.*; with better land, *Three* or *Two*. GRASS on the average, *Two cwt.* TURNIPS, THREE or TWO. Price 12*s*. per cwt. Agents, DAVY, MACKMURDO, & Co., Manufacturing Chemists, 100, Upper Thames-street, London.

CHOICE FLOWERS AND PLANTS IN POTS.

HUMPHREYS'S INODOROUS SOLUBLE COMPOUND. A few grains dissolved in water, and used occasionally, are effective. For list of Agents see other Advertisement.

MOST IMPORTANT TO FARMERS AND GRAZIERS.

GIBBONS' DISINFECTING OINTMENT, a most effectual and perfect cure for Epidemic and Foot-rot in Sheep; also for Epidemic and Foul in Cows' Feet, and for the Grease and Thrush in Horses; prepared only by HENRY GIBBONS, Agricultural Chemist, Wolverhampton.

This Ointment effectually destroys the American grub on Fruit-trees. Sold by all respectable Druggists in Town and Country, in packets at 2*s*. 6*d*. each. Mr. William Bailey, Manufacturing Chemist, North Street, Wolverhampton, is appointed Sole Wholesale and Shipping Agent.

IMPORTANT TO AGRICULTURISTS AND OTHERS.

ANALYSES OF SOILS, MANURES, &c., are conducted by MR. MITCHELL, Analytical Chemist (late of the Royal Polytechnic Institution), No. 5, Victoria Cottages, Hawley Road, Kentish Town.

A vacancy now occurs for one house or outdoor Pupil, for the study of Chemistry as applied to Agriculture. Apply as above.

LEVEL.—This Instrument, the invention of a Gentleman extensively engaged in Draining, is confidently recommended for its simplicity and cheapness; it requires only one person to use it, and gives the rise and fall in land as well as the level, and is also adapted for giving a uniform fall to drains. Each Level is packed in a case 18 inches by 3. Price, 2*l*. Direct to W. B. WEBSTER, Hounsdown, near Southampton.

KEENE'S PATENT MARBLE CEMENT.—This CEMENT is particularly adapted for the Walls and Floors of Conservatories and Greenhouses, being calculated, from its extreme hardness, to resist the wear incident to ordinary Plastering. For Floors it has a threefold advantage over Stone-paving: 1st, in its lightness: one inch in thickness of KEENE'S CEMENT sufficing where 2 to 3 inch flagging would be employed. Next, in its appearance, combining as it does the hardness of stone with a uniform colour and even surface free from joints; and lastly, in economy, being one-third the price of Portland paving.

The most conclusive evidence can be given of the utility of KEENE'S CEMENT for these purposes by the Patentees and Manufacturers.—JOHN BAZLEY WHITE and SONS, Millbank-street, Westminster.

GREAT ECONOMY.—Much time and a great deal of labour will be saved by the use of the SUSSEX CHURN. ATTWOOD, WIMBLE, and WARNER, Manufacturers, Lewes. This Churn being made entirely of block tin, the necessary degree of temperature can be given to the cream, by placing it in a pan of cold or hot water, which ensures the butter coming in 10 or 12 minutes at all seasons of the year. The simplicity of its construction, and the facility with which it may be cleaned, are no inconsiderable advantages over those now in common use.

Sizes.	Nos. 00.	0.	1.	2.	&c.
Churn	2½ lbs.	4 lbs.	7 lbs.	14 lbs.	28 lbs. of butter.
Price with pans complete,	18*s*.	20*s*.	25*s*.	33*s*.	40*s*.

Delivered, carriage paid, to any part of London.

London Agents.—BENHAM, 19, Wigmore-street, Cavendish-square; LIVERMORE, 30, Oxford-street; BAILY, 71, Gracechurch-street; WRIGHT'S Range Warehouse, near the Monument.

Export Agent.—BARNES & Co., 109, Fenchurch-street.

N.B.—To be seen at the Polytechnic, and Adelaide Gallery.

Observe.—The Improved Water Pail, 4*s*. and 5*s*. each.

ORNAMENTAL WIREWORK FOR THE GARDEN.
390, Oxford-street, London.

G. B. THOMPSON begs to tender his acknowledgments to the Nobility and Gentry who so kindly and liberally patronised his Manufacture of Ornamental Wirework, during the past years, and begs respectfully to remind them that with the opening season he has prepared an extensive assortment of Useful and Fancy Articles, suited to the Greenhouse and Flower-garden, and invites them to an inspection of his newly-arranged and well assorted stock of Flower-baskets, Trainers, Borders, Stands, Garden Arches, Temples, Vases, and durable Cast-iron Garden Chairs and Seats, with his well-known and generally-approved Water-pot, fitted with finely-perforated roses, suited to the varying texture of different Plants; Hothouse Engines, Syringes, Fumigating Bellows, and all other Horticultural Tools and Implements of the most novel and improved manufacture. Game and Cattle Fences in variety.

RAMS FOR RAISING WATER WITHOUT LABOUR, WHERE A FALL CAN BE OBTAINED,

FOUNTAINS of every description. Specimens of the Fountain to be seen at the above address.

Also a Ram fixed on the premises. F. ROE, 70, Strand, London.

Every kind of Garden and other Pumps, Well Engines, &c.

With power to add to their number.

BANKERS.—The York City and County Banking Company.
STANDING COUNSEL.—H. Bellenden Ker, Esq., Lincoln's-inn.
DRAINING ENGINEER.—James Smith, Esq. (Deanston.)
SOLICITORS.—Messrs. Blanchard, Richardson, and Gutch, York.
SECRETARY.—John H. Charnock, Esq., Wakefield.

This Association is formed for the purpose of affording to the Agricultural Interest, by means of its collective capital, the funds necessary for the THOROUGH DRAINING OF LAND; and of executing and superintending the execution of the works required for this purpose on the most economical and effective principles—repayment of the money advanced to be made, with interest, by such equitable half-yearly instalments as in the several cases may be determined.

Among the various objects to which of late years collective capital has been more or less successfully applied, it is not a little surprising that the one which, of all others, offers the most certain and profitable return, with the soundest security, should have hitherto been almost disregarded. The time, however, has arrived, when an urgent desire for Agricultural improvement on the one hand, and a dearth of safe and profitable investment for superabundant capital on the other, renders such an Association highly desirable to both the landed and monied interest, whilst to the community generally an almost incalculable advantage will be secured by a proportionate increase of labour and food.

At a meeting of the council of the Yorkshire Agricultural Society, held in York, on the 20th of December, 1843, a resolution was passed, approving generally of the objects of this Association, and at the monthly meeting of the Wakefield Farmers' Club held on the 5th January, 1844, a resolution approving of the principle and objects of the Association, was unanimously adopted.

At the meeting of the Royal Agricultural Society of England, at Liverpool, in July, 1841, Lord Stanley remarked—that "there was no bank in the whole country—no commercial speculation—no investment so safe, so sure and profitable, as that in which even borowed capital may be engaged, by investing it under the ground of your own soil." And in reference to this Association, his Lordship, in a letter to the Committee says:—"I am fully satisfied of the benefits which such an Association is capable of conferring on the country, if confined to its legitimate object—the lending of capital on the security of an investment in draining; and I think it very probable that many landed proprietors would avail themselves of the facilities afforded by an institution lending money on land, repayable by instalments—a condition on which few private parties are willing to lend.

Bearing in mind the important objects of the Association, and the perfect security with which its operations can be conducted, at a comparatively trifling expense (no large expenditure for previous outfit being required), it may be reasonably expected that the return for the capital embarked will be such as to insure the support of prudent and permanent investors, thereby divesting it of that speculative character which has stigmatised so many modern projects, and which it is the especial desire of the Committee to avoid.

Application for prospectuses, and further particulars to be addressed to the Solicitors, Messrs. BLANCHARD, RICHARDSON, and GUTCH, York; or to J. H. CHARNOCK, Esq., the Secretary, Wakefield.

AUSTRALASIAN COLONIAL and GENERAL LIFE ASSURANCE and ANNUITY COMPANY, 126, Bishopsgate-street, Corner of Cornhill.

Capital £200,000, in 2000 Shares.—DIRECTORS:—

E. Barnard, Esq., F.R.S.
Robert Brooks, Esq.
Henry Buckle, Esq.
John Henry Capper, Esq.
Gideon Colquhoun, Esq.
C. E. Mangles, Esq.
Richard Onslow, Esq.
William Walker, Esq.

BANKERS.—Union Bank of London.
COLONIAL BANKERS.—The Bank of Australasia (incorporated by Royal Charter, 1835), No. 2, Moorgate-street.
PHYSICIAN.—Patrick Fraser, Esq., M.D., No. 62, Guildford-st.
SECRETARY.—Edward Ryley, Esq.

ASSURANCES may be effected with this Company at unusually favourable rates, affording every variety of accommodation to the Assured. Participation in Profits, ascending and descending scales of premium, permission to retain one-third of the premium, which is charged as a debt against the policy, tables for the assurance of a sum payable in the event of death to the executors of the Assured, or to himself upon the attainment of the ages of 45, 50, or 60.

To EMIGRANTS to the AUSTRALASIAN COLONIES assured for the whole life, this Company offers the advantages of permission to proceed to, to reside in, and to return from those colonies without extra premium, and to pay their premiums there.

All questions relating to Assurance and Annuities, addressed to the Secretary, will receive immediate attention.

NATIONAL MERCANTILE LIFE ASSURANCE SOCIETY, ARTHUR-STREET WEST, LONDON BRIDGE. (Established in 1837.)

Directors.

Chairman.—Robert Currey, Esq.

Edward Baker, Esq.
Jasper Capper, Esq.
Thomas Dakeyne, Esq.
Giles Redmayne, Esq.
James Spicer, Esq.
Henry Sterry, Esq.
Thomas Bax, Esq.
Joseph Cooper, Esq.
Russell Jeffrey, Esq.
William R. Spicer, Esq.
Joseph Sterry, jun., Esq.
Robert Wilcoxon, Esq.

Bankers.—Messrs. Prescott, Grote, and Co.

ADVANTAGES.

A BONUS of two-thirds of the Profits allotted to the Assured.
LOWER RATES OF PREMIUM charged for Assurances without profits.
PREMIUMS payable Annually, Half-yearly, or Quarterly.
ASSURANCES OF EVERY DESCRIPTION may be effected. Among others, the important one, *originated by this Society*, of securing a sum to the Assured himself on his attaining any given age, or to his family *in the event of his earlier death.*
A POCKET DIARY containing detailed particulars, may be had on application at the Office, or of the Society's agents.

JENKIN JONES, Actuary and Secretary.

DISEASED AND HEALTHY LIVES ASSURED.

MEDICAL, INVALID, and GENERAL LIFE OFFICE, 25, Pall Mall, London.—This Office is provided with very accurately-constructed Tables, by which it can Assure Diseased Lives on Equitable Terms. Increased Annuities granted on *unsound* Lives, the amount varying with the particular disease. Members of Consumptive Families Assured at Equitable Rates.

E. G. P. NELSON, Actuary.

ARGUS LIFE ASSURANCE COMPANY, No. 39, Throgmorton-street, Bank.

Thomas Farncomb, Esq., Alderman, *Chairman.*
William Leaf, Esq., *Deputy-Chairman.*

Richard E. Arden, Esq.
William Banbury, Esq.
Edward Bates, Esq.
Thomas Camplin, Esq.
James Clift, Esq.
J. Humphery, Esq., M.P., Ald.
Rupert Ingleby, Esq.
Thomas Kelly, Esq., Alderman.
Jeremiah Pilcher, Esq.
Lewis Pocock, Esq.

Physician—Dr. Jeafferson, 2, Finsbury-square.
Surgeon—W. Coulson, Esq., 2, Frederick's place, Old Jewry.
Consulting Actuary—Professor Hall, of King's College.

Advantages of the Argus Life Assurance Company.
Low Rates of Premiums.

In addition to the subscribed capital of 300,000*l.*, the Assured have the security of the Company's Income of nearly 60,000*l.* per annum, yearly increasing, and accumulating Assurance Fund invested in Government and other available Securities, of considerably larger amount than the estimated liabilities of the Company. The Rates of Premium are reduced to the lowest scale compatible with the safety of the Assured and the stability of the Company, thereby in effect giving to every Policy-holder an immediate and certain bonus without risk, in lieu of the deferred and frequently delusive prospect of a periodical division of profits.

Annual Premium to assure £100.

Age.	For One Year.	For Seven Years.	Whole Term.
20	£0 17 8	£0 10 1	£1 11 10
30	1 1 8	1 2 7	2 0 7
40	1 5 0	1 6 9	2 14 10
50	1 14 1	1 19 10	4 0 11
60	3 2 4	3 17 0	6 0 10

One-third of the whole-term Premiums may remain unpaid at 5 per cent. comp. int. as a debt upon the policy for life, or may be paid off at any time without notice.

In Assurances for advances of money as security for debts, or as a provision for a family, when the least present outlay is desirable, the varied and comprehensive Tables of the ARGUS Office will be found to be particularly favourable to the Assured.

A Board of Directors, with the Medical Officers, attend daily, at a quarter before 2 o'clock.

EDWARD BATES, Resident Director.
A Liberal Commission to Solicitors and Agents.

New Edition, price 25*s.* each vol.

DR. LINDLEY'S LADIES' BOTANY, in 2 vols.

8vo, each containing 50 beautifully coloured Plates.

2. DR. LINDLEY'S BOTANICAL REGISTER, published Monthly, price 3*s.* 6*d.* each No., beautifully coloured. The vol. for 1843, bound in cloth, price 2*l.* 4*s.*, is now ready.

3. DR. LINDLEY'S SPLENDID WORK on ORCHIDACEOUS PLANTS is now complete in Ten Parts, price 25*s.* each.

4. A New Edition of SWEET'S HORTUS BRITANNICUS, or Catalogue of Plants. Edited by DON. Price 21*s.*, bound in cloth.

5. SWEET'S BOTANICAL CULTIVATOR. Price 16*s.*, bound in cloth.—JAMES RIDGWAY, Piccadilly; and all Booksellers.

New Edition, now ready, price 16*s.* bound in cloth,

MANURES. By C. W. JOHNSON, Esq., F.R.S., &c.

brought down to the present time, and giving the fullest and most authentic information on every kind. Also, by the same Author, TRACTS for the Use of AGRICULTURAL SCHOOLS, price 1*s.* each. On Agricultural Chemistry—The Young Farmer's Calendar; and the Cottage Farmer's Assistant, containing Cottage Cookery, &c.

JAMES RIDGWAY, Piccadilly.

Also—1. A Fourth Edition of MORTON on SOILS; with the Two Reports of Whitfield Example Farm. Price 10*s.*

2. A New Edition of SINCLAIR on GRASSES. Price 30*s.* coloured plates.

Just published, fcap. 8vo, 6*s.* cloth,

LESSONS on CHEMISTRY, for the Use of Pupils in Schools, Junior Students in Universities, and Readers who wish to learn the fundamental Principles and leading Facts, with Questions for Examination, a Glossary of Chemical Terms; Chemical Symbols, and an Index. By WILLIAM H. BALMAIN.

With numerous Woodcuts, illustrative of the Decompositions.

London: LONGMAN, BROWN, GREEN, and LONGMAN.

THE GARDEN—AND USEFUL BOOKS FOR FAMILIES.

THE GARDENER'S MANUAL, containing Practical Instructions for the Cultivation and Management of the Flower, the Fruit, and the Kitchen Garden, with the Hothouse, the Greenhouse, and Conservatory. New edition, in foolscap 8vo, price 2*s.*, cloth lettered.

THE BOTANIST'S MANUAL, and Woodland Companion, including Vegetable Physiology, and the Natural History and various uses of British Fruit Trees. Foolscap 8vo, price 2*s.*, in boards.

THE HOUSEKEEPER'S MANUAL; containing Practical Directions in English Cookery, Preserving, Pickling, Confectionery, Pastry, Cakes, Jellies, and Bread making; Domestic Brewing, and British Wine making of every description, for the use of small or large families. A new edition, foolscap 8vo, containing about 200 pages. Price 2*s.*, cloth lettered.

THE FAMILY PHYSICIAN; or, DOMESTIC MEDICAL GUIDE: a Manual of Health, with Recipes, including the Diseases of Children, Instructions on Dress, &c., in foolscap 8vo, 2*s*, cloth lettered. Where may be had THE NEW LIBRARY OF USEFUL KNOWLEDGE, No. 1 to 25, price 6*d.* each, each Number completing a subject.

London: CRADOCK & CO, 48, Paternoster-row.

DE CANDOLLE'S PRODROMUS. — The NEW VOLUME (Vol. VIII.) of DE CANDOLLE'S PRODROMUS is published this day.

WILLIAM PAMPLIN, 45, Frith-street, Soho.

LIEBIG'S AGRICULTURAL CHEMISTRY.

Third edition. 8vo. 10*s.* 6*d.*

LIEBIG'S ANIMAL CHEMISTRY. Second edition. 8vo. 9*s.* 6*d.*

LIEBIG'S CHEMICAL LETTERS. Second edition. Fcap. 8vo. 4*s.* 6*d.*

LINDLEY'S ELEMENTS of BOTANY. Many Woodcuts. 8vo. 10*s.* 6*d.*

TURNER'S CHEMISTRY. Seventh edition. By Professors LIEBIG and GREGORY. 8vo. 1*l.* 8*s.*

PORTRAIT of PROFESSOR LIEBIG. 7*s.* 6*d.*

Printed for TAYLOR and WALTON, 28, Upper Gower-street.

WHITE'S FARRIERY—IMPROVED BY SPOONER.

With coloured Frontispiece and Woodcuts. 8vo. 16*s.* cloth.

A COMPENDIUM OF THE VETERINARY ART.

By JAMES WHITE. 17th Edition, entirely reconstructed, with considerable additions and alterations, bringing the work up to the present state of Veterinary Science, by W. C. SPOONER.

* * Also, lately published, 8vo, 9*s.* cloth,

WHITE'S COMPENDIUM OF CATTLE MEDICINE. Sixth Edition, rearranged, with copious Additions and Notes, by W. C. SPOONER.

London: LONGMAN and Co.; T. TEGG; WHITTAKER and Co.; SIMPKIN and Co.; HOULSTON and STONEMAN; and C. DOLMAN.

BEE-HIVE.—THE BAR AND FRAME-HIVE.

Early in April will be published, by Mr. JOHN VAN VOORST, of Paternoster-row, in the form of a pamphlet, for the convenience of transmission through the Post-office,

A DESCRIPTION of the BAR and FRAME BEE-HIVE, invented by W. A. MUNN, Esq., with some short Directions for the Management of an Apiary.

A Bar and Frame-Hive may be seen at Mr. JOHN MILTON'S, No. 10, Great Marylebone-street, London.

SECOND EDITION.

MILLS'S TREATISE ON THE CULTURE OF THE CUCUMBER, MELON, SEA KALE AND ASPARAGUS. Published by WILLIAM SMITH, 113, Fleet-street.

The truth of Dr. LINDLEY'S statement, in his review of the above work, was strictly verified at the late Great Exhibition of Cucumbers at Ipswich, viz., "Any person having Mills's Book, whether a Gardener or not, can grow Cucumbers."

By the report of the above exhibition in the *Gardeners' Chronicle*, the first prize was won by an Amateur, Edward Leathes, Esq., on **Mills's system.** Four Seeds of Mills's Best Early Cucumber, 2*s.* 6*d.*; eight ditto, 5*s.* Post-office Orders to be made payable at Brentford.

WORKS on AGRICULTURE, GARDENING, &c.,

PUBLISHED BY

WILLIAM CURRY, JUN., and Co., Dublin; Sold by LONGMAN and Co., London, and all Booksellers.

HINTS to SMALL FARMERS. By MARTIN DOYLE. New Edition, 1*s.* sewed.

By the same Author,

PRACTICAL GARDENING. 12mo, cloth, 4*s.*; or in Two Parts—1. The FLOWER-GARDEN, 2*s.* sewed; 2. The KITCHEN-GARDEN, 1*s.* 6*d.* sewed.

ADDRESS to LANDLORDS, on subjects connected with the Improvement of their Estates and the Melioration of the Lower Orders. New Edition, enlarged, 2*s.* sewed.

IRISH COTTAGERS. 1*s.* sewed.

HINTS on HEALTH, TEMPERANCE, and MORALS. 1*s* swd.

HINTS on PLANTING, CATTLE, FISHERIES, &c. 1*s.* sewed

The Works Collected in Two Vols., cloth, 12*s.*

A TREATISE on AGRICULTURE, comprehending the Nature, &c. of Soils, the Cultivation, &c. of Plants, and the Husbandry of the Domestic Animals, &c. Second edition, enlarged, with numerous illustrations. 8vo. 15*s.*, cloth.

DIRECTIONS on PRACTICAL AGRICULTURE, addressed to the Working Farmers of Ireland. By the Rev. WILLIAM R. TOWNSEND, Rector of Aghadda, Diocese of Cloyne. 2d Edition. 1*s.* sewed.

TREATISE on an IMPROVED and CHEAP METHOD of CULTIVATING ASPARAGUS. By NINIAN NIVEN. 1*s.* sewed.

FLORA HIBERNICA, comprising the Flowering Plants, Ferns, Characeæ, Musci, Hepaticæ, Lichens, and Algæ of Ireland, arranged according to the Natural System, with a Synopsis of the Genera according to the Linnæan System. By JAMES TOWNSEND MACKAY, M.R.I.A. 8vo. 16*s.* cloth.

IMPROVED EDITIONS OF CLATER'S VETERINARY WORKS.

Just published, 28th edition, 12mo., price 6*s.* cloth lettered,

CLATER'S EVERY MAN HIS OWN FARRIER: containing the Causes, Symptoms, and most approved Methods of Cure of the Diseases of Horses and Dogs. By FRANCIS CLATER, and his son, JOHN CLATER.

CLATER'S EVERY MAN HIS OWN CATTLE-DOCTOR: containing the Causes, Symptoms, and Treatment of all the Diseases incident to Oxen, Sheep, Swine, Poultry, and Rabbits. By FRANCIS CLATER. The ninth edition, in 12mo. Price 6*s.* cloth.

The above works have long been known and estimated for their valuable receipts; they have now undergone a thorough revision by Mr. Youatt, author of "The Horse," &c., with the assistance of Mr. Spooner, and they may be honestly said to embody the sentiments and practice of the best veterinary surgeons of the present day.

London: CRADOCK and Co.; SIMPKIN, MARSHALL, and Co.; and HOULSTON and STONEMAN.

A NEW RAILWAY PAPER.—The FIRST NUMBER of THE RAILWAY CHRONICLE will appear on the 20th of April. A detailed Prospectus will be ready on the 30th inst., and will be sent free, by post, to all who furnish their address to the Office, 14, Wellington street North, Strand, London.

THE LATE MR. LOUDON.—SUBSCRIPTIONS will be received by the Treasurer, JAMES COOK, Esq., 40, Mincing-lane, London, and by the following Bankers:—Messrs. GLYN & Co., Lombard-street; Sir JOHN W. LUBBOCK, Bart. & Co., Mansion House-street; and Messrs. COUTTS, Strand, London.

The following is a List of the present Subscriptions:—

Mr. G. McIntosh, Dalkeith Park	0	2	6
Mr. W. Evans, Edinburgh	0	7	0

Letters and communications addressed to the house, 21, Regent-street, under cover to Mr. Drake, will receive immediate attention.

News of the Week.

THE important debate on Lord Ashley's motion for reducing the work of females in factories from 12 to 10 hours a day, terminated on Monday in the defeat of Ministers by a majority of 9. The Government Bill specified 12 hours as the limit for female work, and Lord Ashley brought forward his motion as an amendment, contending that on moral and physical grounds Parliament was bound to interpose, and rescue the female operatives in our factories from the unnatural sphere into which the overbear-

ing spirit of capital had thrown them. Sir J. Graham and Sir R. Peel opposed the amendment as an unjust interference with a particular branch of manufactures, while others were left without any kind of restriction. They argued that a reduction of labour would lead to a reduction of wages, and that a limitation of the employment of women and children was really a limitation of the labour of adult males. Sir. R. Peel considered that the adoption of the amendment would lead to further legislation in regard to agricultural and other occupations involving continuous labour in exposed or unhealthy atmospheres; and declared that he could not attempt a task so extensive in its nature and application. Lord J. Russell supported Lord Ashley, in the hope that a limitation of the hours of labour would compel us to resort to additional supplies of foreign corn, in order to counteract the fall in wages. After an interesting discussion, the House divided, leaving Ministers in a minority of 9.

In France, M. Guizot's Cabinet have been more successful in the great debate on the Secret Service Money Bill, which, by consent of all parties, was considered a vote of confidence in the Ministry. The debate commenced on Monday, and after two days' discussion, directed chiefly to the quarrel between the Church and the University on the subject of education, the Chambers divided, giving Ministers a majority of 56; a much larger one than they had themselves anticipated. This result decides the stability of the Cabinet, which is now secure in the possession of office for the remainder of the session. —In Spain the Alicante insurrection has added another sanguinary scene to the revolutionary drama of the country. Gen. Roncali has captured and shot M. Bonet the leader of the insurgents and 23 of his followers, including many officers of high military rank. Gen. Puig-Samper has also executed the insurgent leaders at Lugo, and an account of a fresh outbreak at Valencia will probably add to this catalogue of atrocities.—The accounts from Portugal state that the military rebellion is not yet subdued, and that it has gained fresh importance by the accession of large parties of banditti. The students at Coimbra have pronounced in favour of the movement, and the Queen's troops are still inactive before Almeida, being completely powerless for want of artillery.—From Stockholm we have the long expected announcement of the death of the King of Sweden, one of the last great survivors of the French Revolution, and one of the most prudent and successful of Napoleon's generals.

Home News.

COURT.—Her Majesty and Prince Albert, accompanied by the Prince of Wales and the Princesses, left town on Saturday for Claremont. On Monday, Prince Albert visited the Isle of Wight for the purpose of inspecting Osborne House, near Cowes, the proposed marine residence of her Majesty. His Royal Highness travelled by a special train on the South Western Railway, and embarked at Portsmouth, where he was received with the usual honours. It is said that the result of the Prince's visit will be the selection of the mansion for one year's trial at a rental of 1000*l*. On Tuesday, the Queen and Prince, accompanied by the Princess Royal, came to town from Claremont, and on Wednesday her Majesty held her second levee for the season. On Thursday, her Majesty held a court at Buckingham Palace, and afterwards took an airing in an open carriage. The first drawing-room will be held on Monday next the 25th inst.—Orders have been issued for the Court to go into mourning on Tuesday next for the King of Sweden, and to go out of mourning on the 16th April.

Parliamentary Movements.—Thomas Bateson, Esq., brother of the late member for Londonderry, has been elected for that town without opposition.—A vacancy has occurred in the representation of Hastings by the retirement of Mr. Planta; and Mr. R. R. R. Moore, of the Anti-Corn-Law League, has come forward as a candidate. —A vacancy has also occurred in the borough of Christchurch by the resignation of Sir G. Rose.

Death of the Earl of Lonsdale.—His Lordship died at his residence, at Twickenham, on Monday last, in his 87th year. He had been some time indisposed, and was seized on Saturday with the prevailing influenza. His Lordship is succeeded by his son, Lord Lowther, the present Postmaster-General.

Royal College of Physicians.—On Wednesday the Fellows of this College met for the purpose of choosing a President in the room of the late Sir Henry Halford, when Dr. Paris was elected, by ballot, to fill that office.

Knighthood.—The Queen has been pleased to confer the honour of knighthood on Capt. James Clark Ross, R.N.; on Dr. Charles F. Forbes, Inspector-General of Hospitals; on Geo. Philip Lee, Esq., Lieutenant of the Yeomen of the Guard; on Col. Robert Nickle, K.H.; and on William Bain, Esq., Master, R.N.

The Church.—The Queen has been pleased to direct letters patent to pass the Great Seal of the United Kingdom, nominating the Rev. Edward Feild, M.A., to the bishopric of Newfoundland. The Queen has also been pleased to grant the archdeaconry of the Isle of Man, and the rectory of Andreas in that island, to the Rev. J. C. Moore, M.A., the same being void by the death of the Rev. J. C. Hall.

Foreign.

FRANCE.—The official documents which Sir R. Peel laid before Parliament last week relative to the French protectorate of Otaheite, have supplied the Paris papers with ample materials for comment. The Ministerial journals receive them with satisfaction, and regret that they were not given to the public before the discussion in the Chamber of Deputies, believing that they would alone have been sufficient to have destroyed all the accusations directed on that occasion against the Government. They approve of them as showing that the English Government, from the beginning of the establishment of a protectorate by France over the Society Islands, had given the British naval commanders orders to make no difficulty of saluting the French flag, and also directed the English consul to recommend to Queen Pomaré to observe the convention which she had signed. On the other hand the Opposition papers consider that the Papers justify Admiral Dupetit Thouars, and supply additional proof that it was fear of England which induced the Government to recall him. The journals also refer to the conversion of the Three-and-a-Half per Cents. in this country, which the greater number of them contend ought to be immediately imitated in France by the reduction of the interest on the French Five per Cents. The demonstration of sympathy for Ireland at Covent-garden Theatre is the subject of comment in most of the papers. All of them praise the moderation and justness of the views announced by Mr. O'Connell, and prophecy that in his peaceful agitation in England, he will prove a more dangerous enemy to the Ministry, than in his violent system of agitation in Ireland.—The feud between the Clergy and University is daily assuming additional violence. The Bishops of France are gradually joining in the remonstrances which the Archbishop of Paris and other Prelates have made against the irreligious tendency of the system of public instruction pursued by the University; and, in upholding the latter institution, the Government have failed to conciliate the influential body whose support it is interested in securing. We mentioned last week the condemnation at the Paris assizes, of the Abbé Combalot, for a publication against the University. A letter has since been addressed to the Abbé by the Bishop of Chalons, expressing the approbation and sympathy of the clergy of his diocese; and another letter has been published by Cardinal Bonald, the Bishop of Lyons, in which his eminence attacks the University and the Government most violently.—In the Chamber of Deputies on Monday a discussion took place, upon a motion brought forward by M. de Beaumont, M. Lacrosse, and M. Leyrand, for the prevention of bribery at elections. The motion was agreed to without a division. M. Duchatel, the Minister of the Interior, protested against the allegation made by the Opposition respecting the intervention of the Government agents in elections, and declared that the Government was most anxious to secure the purity and liberty of election. The Chamber then commenced the debate upon the Secret Service Money Bill. M. F. Barrot (the brother of M. Odillon Barrot, the leader of the Opposition) made a long speech against the bill, and declared that he could not give the Ministry his confidence. M. Ledru Rollin followed, and excited great clamour by alleging various questions of foreign policy, wherein Louis-Philippe had acted without consulting his Prime Ministers; and M. de Lamartine delivered a speech, chiefly directed against M. Guizot and his Eastern policy, but which met with the approbation of no party, because he found fault with all of them. The debate was then adjourned to Tuesday, when M. Isambert delivered a speech against the church; declared that the clergy had never assumed so warlike an attitude, and read a number of documents, with the view of proving that the Keeper of the Seals and Minister of Justice and Public Worship had not enforced the existing laws against them. The Minister followed, and entered into a vindication of the conduct he had adopted towards the Bishop of Chalons and the other prelates who have censured the irreligious tendency of the instruction pursued by the University. M. Dupin, the former President of the Chamber, alluded to the quarrel between the clergy and the University, and exhorted the Ministry not to yield to the demands of the clergy, which would only lead to further pretensions on their part. M. J. Lasteyrie then brought forward an amendment, to the effect that the secret service money should be reduced by 80,000f.; but it was rejected by a majority of more than 50. A scrutiny was then called for on the whole question, and Ministers obtained a majority of 56, a much larger one than M. Guizot expected, so that it leaves them in quiet and safe possession of their places till another session. A motion of M. de St. Priest for reducing the postage on letters has been admitted in the bureaux.—The quarrel between the English and French sailors at Marseilles has been made the subject of an action in the law courts; the two mates of the English vessel Romulus have been sentenced to a fine of 16 f. each, and one month's imprisonment; and 2 men of the same ship to 10 days' imprisonment, besides 500 f. fine for the benefit of the French captain, the costs of the prosecution to be paid by the Romulus.—The *Moniteur* announces that the Duchess of Nemours has entered the sixth month of her pregnancy. The Duke of Nemours is so far recovered from his late illness, that he is able to take carriage exercise.—Letters from Rouen state that in consequence of the difficulty of procuring land, the works of the railway cannot be proceeded with for some weeks to come, and that consequently more than 100 English workmen who have gone over to seek employment, are wandering about Rouen without food or other means of support.

SPAIN.—We have accounts from Madrid to the 14th inst. A dispatch from General Roncali, dated Alicante, the 8th inst., announces the capture and execution of Bonet and 23 of his followers; they were shot in the back on being identified, without even the semblance of a trial. According to the *Castellano*, on his being led to the place of execution he made important disclosures, endangering several persons residing at Madrid, as having been the chief promoters of the Alicante insurrection and other movements. The *Castellano* adds that Bonet promised to make other disclosures if his life were spared, but that General Roncali rejected the proposal, and would not even consent to see him. All the accounts agree in stating that he was seized by the inhabitants of Sella, who delivered him up to the troopers sent in pursuit of him; 17,000 reals were found on his person, which General Roncali handed to the captors. Amongst the persons shot with Bonet were two Colonels, eight other officers of the regular army, a Colonel, and six other officers of the National Guards, and the Alcada-Regidor. On the same day that this horrible execution took place, another of her Majesty's Generals was shedding blood at the other end of the Peninsula. On the 8th, the Cabecilla Castrovilar, M. Fernandez a clergyman, and two of his companions, were put to death at Lugo by General Puig-Samper. We shall probably hear also of some slaughter at Valencia, where according to a letter of the 9th, another extensive conspiracy has been detected, in which a number of officers and soldiers of various corps of the garrison were implicated. The objects of the conspirators were, it is stated, to compel Gen. Roncali to raise the siege of Alicante, to seize upon the person of Maria-Christina, and to place themselves at the head of the cavalry. It is added that they were in possession of considerable sums, and that most of them have been apprehended. Advices from Murcia state that as soon as they heard of the fall of Alicante, the French and English Consuls at Carthagena left that place and proceeded to Escombrera. An English and a French ship also quitted the port. It was expected at Madrid that Carthagena would soon be in possession of the Queen's troops, although the leaders in the Murcia and Orihuela movements had retired thither. Queen Christina arrived at Barcelona on the 4th. A great part of the population received her at some distance from the town. After hearing a *Te Deum* at the cathedral, she walked about, attended by all the civil and military authorities. All the balconies, particularly those of the Rambla, were adorned with draperies, and filled with spectators, who cheered as she passed. On passing the French Consulate, her Majesty particularly saluted M. de Lesseps and the officers of the French squadron. During the evening a portion of Barcelona was illuminated. The most brilliant display was at the French Consulate, the arms of France and Spain in gas, &c., with the tricolor and Spanish flags. Her Majesty was expected to reach Valencia on the 12th.—A fire broke out at Madrid on the 12th, which destroyed the hotel of the Administration of the Mines. The wife and family of M. Olozaga occupied apartments on the second floor of the building. No lives were lost.—The Marquess de Veluma has accepted the post of Plenipotentiary and Envoy Extraordinary from the Court of Spain to Queen Victoria, and will shortly arrive in London, accompanied (as attaché) by M. Perez de Castro, who was Queen Christina's Prime Minister during the events at Valencia, which led to her retirement from Spain.—A letter from Havannah, which arrived at Corunna on the 1st by the French steam-frigate Gomer, states that a complete panic pervades the slave-traders and speculators of Cuba, in consequence of Government sending a steam squadron to the coast of Africa. Numbers of Spaniards and Frenchmen in Madrid, Corunna, Bordeaux, and Bayonne, have been nearly ruined by the activity of our cruisers on the African coast.

PORTUGAL.—Accounts from Lisbon to the 12th inst., confirm the grave nature of the disturbances which have sprung out of the military revolt at Torres Novas. A commotion of a formidable character, connected with the objects of the Almeida leaders, broke out in the University of Coimbra on the 8th inst. The students in revolt had possession of the town for two hours, attacked the troops, and made a prisoner of the civil governor. They were finally routed by the military. The governor was released, and some of the former were dangerously wounded; some, it would appear, mortally. The fugitives were supposed to have effected a junction with a Guerilla party, at three or four leagues distance from Coimbra. In the meantime, the telegraph has been rendered unserviceable. The couriers with the Government correspondence have been robbed by the banditti, which have sprung into existence in the province of Beira and upper part of Estremadura; and the Government evidently feels the importance of this new feature in the disturbance of the peace of the country. The loan, nominally of 1000 contos, has been carried into effect —200 contos of it to consist of depreciated Government securities. At Almeida, the force under Bomfim remained in undisturbed possession of the town, the commanders of the Queen's troops in front of it still waiting for the arrival of the artillery.

BELGIUM.—A letter from Antwerp of the 12th, says—"We have had, for these forty-eight hours, one of the most awful storms that we remember ever to have witnessed—sudden squalls, torrents of rain, hail, thunder, and lightning. Nothing was wanting, and we have reason to fear that we shall have to record many disasters. None of the vessels in our port have sustained any damage."—The *Liege Gazette* says—"The incessant rains of the last two days have caused the Meuse to rise very considerably. The Ourthe and the Verdre have risen to a greater height than on the previous occasion. These

impetuous torrents, which carry everything before them, make us fear that the works of the railway of Le Verdre may be damaged." Accounts from other places give similar statements.—The King and Queen of the Belgians are expected to leave Brussels next week, on a visit to the Queen of England.

Germany.—It has been currently rumoured in Berlin that Queen Victoria would visit that capital in May next; but it will be seen by our Parliamentary news that there is no foundation for the report.—A letter from Hanover, of the 11th, announces that the Assembly of the States will be closed by the end of May, and that the King will immediately after repair to London. The States will only be busied with financial measures, and amongst the rest with the question of a loan of nine or ten millions of crowns for the construction of railroads.—The journals announce that M. Haber, whose duel made so much noise, had been lately tried for the act, and sentenced to six months' imprisonment in a fortress, the minimum of the penalty. The seconds were acquitted.—Accounts from Vienna announce the safe accouchement of the Princess Nicholas Esterhazy, the daughter of the Earl of Jersey, of a son, and when the courier left the Austrian capital the Princess and infant were progressing favourably.

Italy.—A letter from Naples in the *Augsburg Gazette* of the 14th inst., states that negotiations have commenced with the view of effecting a marriage between his Royal Highness the Duc de Bordeaux and his Sicilian Majesty's third sister.—The *Cologne Gazette* announces that the railroad from Leghorn to Pisa was opened on the 27th ult., and that the distance is performed in 15 minutes.—A letter from Rome states that amongst the manuscripts in Prince Doria's library in that city there have been found forty-seven autograph letters of King Henry IV. to Clement VIII. (Hyppolite Aldobrandini). They are to be speedily published.—The Duchess of Savoy was safely delivered of a Prince on the 14th. The event was announced to the population of Turin by a salute of 100 guns.

Greece.—Letters from Athens of the 29th ult. state, that the National Assembly had decided, by a majority of 111 against 92, that senators should be named for life. The Russian party, defeated on that question, could no longer conceal their dissatisfaction, and its two representatives in the Cabinet, Messrs. Metaxa and Schinas, resigned their offices. Messrs. Mavrocordato and Coletti having refused to accept the vacant departments, they devolved, *pro tempore*, upon Canaris, who thus became President of the Council, and upon Messrs. Mausolas and Melas, who assumed, the one the direction of Foreign Affairs, and the other that of Public Instruction. The *minimum* of the number of senators was fixed at 27, but the King may, in case of need, raise their number to one-half that of the representatives, with the consent of the latter. Princes of the blood were declared by right members of the Senate, and entitled to a deliberating vote, at the age of 25. The President of the Senate is to be eligible for three years, and the members of the Assembly are to receive 500 drachmas per month during the session. Reports of disturbances in Maina were current at the departure of the mail.

Sweden.—The mail from Hamburgh brings intelligence of the decease of the King of Sweden. His Majesty died on the 8th inst. at Stockholm, at 4 P.M., when the reins of government were immediately assumed by his son and successor, Prince, now King Oscar II. The late king was too remarkable an actor in the great drama of the French revolution to allow his death to be recorded without a brief sketch of his extraordinary career. He succeeded to the throne of his adopted father, Charles XIII., on the 15th Feb. 1818. He was born at Pau, in the Pyrenees, on the 26th January, 1764, and was christened by the name of John Baptiste Julius Bernadotte. His father was a lawyer, and gave his son a good education. In 1780, from his own choice, he enlisted in the army and was orderly sergeant in 1789, when the revolution broke out. We find him in 1794 as a general of division, and in 1795 the famous retreat across the Rhine was principally effected under his superintendence. His military talents were quickly discovered by Napoleon, who reposed great confidence in him. The passage of the French army at Neuwied, the siege of Mentz, and many other celebrated military feats, afterwards established his reputation as a Commander of the first rank. He was shortly afterwards requested by Napoleon to undertake the siege of Gradiska, which he accomplished, and displayed military ability of the highest order. At the 18th Fructidor Napoleon selected him to bear the colours which had been taken at the battle of Rivoli. At the conclusion of a treaty of peace at Leöben, the disturbances in the south of France continued to convulse the surrounding country, the Directory of that period appointed Bernadotte Commandant of Marseilles; but he refused to accept this appointment, and in a few months afterwards was installed as Ambassador from the French Republic to the Court of Vienna. A misunderstanding caused a considerable riot at Vienna, where Bernadotte hoisted the tri-coloured flag on his palace, and he left the Austrian capital to go to Rastadt. From that time he was employed by Napoleon in several important military missions, and finally in 1799 was appointed a Member of the Privy Council for the War Department. In 1799 he refused to take the command of the famous expedition against St. Domingo. After the Luneville peace (1801), he was appointed Ambassador to the United States, which he refused. In 1804 he accepted the command in Hanover, where by his humanity and kindness to the inhabitants, he obtained great popularity. At the battle of Austerlitz, Bernadotte's division created great havoc in the Russian army, and Napoleon then created him Prince of Ponte Corvo and Grand Officer of the Legion of Honour. In 1806, on the 14th Oct., when marching from Dornburg, after having beaten Blucher, and pursuing him to Lubeck, he was the only General either of the French or the German allies who used their best endeavours to preserve that city from ruin. He distinguished himself afterwards at the battle of Wagram, and was next appointed Commander of the coast of Holland and Belgium, which trust he also fulfilled to the satisfaction of Napoleon. Bernadotte then retired to comparative privacy in the neighbourhood of Paris, when on the 21st Aug., 1810, he was unanimously elected by the states of the kingdom of Sweden as successor to the throne of Charles XIII., provided he would adopt the doctrines of the Lutheran faith. Napoleon had no influence whatever upon this election; on the contrary, it is well known from the best authenticated memoirs that his wishes were in favour of the King of Denmark, who was likewise a candidate for the Swedish throne. After having elected the new successor to the throne a Knight of the Order of the Seraphim, Charles XIII. confirmed the election at Osebroe and adopted Bernadotte as his son. Napoleon, upon being applied to for a confirmation, declared that he never could nor would interfere with the election of a free nation. Bernadotte accepted the choice of the Swedish nation, and after his landing on the Swedish shores on the 20th Oct. 1820, he had the first interview with his adopted father, Charles XIII., which at that time caused a great sensation throughout Europe. As Crown Prince of Sweden Bernadotte distinguished himself as an able commander during the campaigns of 1813 and 1814. Charles XIII. died on the 5th Feb. 1818, and his adopted son Bernadotte succeeded him on the throne without the slightest opposition. His wise and temperate government whilst he reigned over the Scandinavian peninsula will be recorded in history; and perhaps no monarch ever went to his grave so sincerely regretted by his subjects.

Turkey and Syria.—Letters from Constantinople of the 27th ult. state, that on the 23d, immediately after the arrival of the steamer with despatches from the English Government, a conference was held between Sir S. Canning and Baron de Bourqueney, the Minister of France; subsequently to which, the first interpreters of the British and French Legations proceeded to the Minister for Foreign Affairs, with a new communication relative to the recent execution of renegades. On the following day the principal Ulemas met in Council, under the Presidency of the Sheik-el-Islam, the head of the Religious Department, to consider the contents of the communication. Two other Councils were held at the Porte for the same purpose on the 25th and 26th; but down to the departure of the mail no reply appears to have been received.—We learn from the Xanthus that no new discoveries of any importance have been made, and indeed the excavations had been at a stand-still more than a month, in consequence of the river having overflown its banks from heavy rains, and flooded the whole country, washing away roads, bridges, and everything else that the expedition had constructed. It is reported that Mr. Fellows has at length discovered that the horse tomb cannot be removed, or rather hoisted, into a lesser sized ship than a liner, and that he has applied to the Admiral to send him the Indus for this purpose.

Parliament.

HOUSE OF LORDS.

Monday.—Lord Denman adverted to the case of the individual condemned to death in Louisiana for aiding a slave to make his escape. He hoped that the expression of the feeling which prevailed in England, and over Europe, would reach the United States in time to prevent the infliction of a punishment so utterly disproportioned to the alleged offence.—The Bill for the reduction of the Three-and-a-Half per Cents. was read a second time, after some discussion.—Earl Fitzwilliam presented a petition from Glasgow, on the subject of the state of Ireland. These petitioners stated that one principal grievance of which Ireland complained was the Established Church, which was not only intolerant and exclusive in spirit and character, but opposed to the conviction of a great body of the people; that it was used as a tool of political faction, and was subversive of general tranquillity; that it was an establishment which "did not admit of being amended, and must, to obtain the pacification of Ireland, be wholly abolished." The noble Earl said he did not coincide to the extent of spoliation with the petitioners; he only went half that distance. He warned their Lordships against any attempt to make the Irish Catholic priesthood stipendiary pensioners of the Government. There were rumours abroad, he said, that the Government were not asleep on that question, and that they had some plans floating in their minds in relation to the Catholic priesthood of Ireland. But what he protested against was, that the Government should make them pensioners and stipendiaries.—The Duke of Wellington said he gathered from the statements of the noble Earl, that the primary principle of his plan was to repeal the laws on which the Reformation in this country is founded. "My Lords," said his Grace, "I take this opportunity of warning you against listening to any such doctrines, come from whom they may; and I call on you to be cautious how you permit them to be introduced to your notice; for you may rely on it that there is not a single Protestant in this country whose position in society, and whose religion, are not vitally interested in the maintenance of the Reformation. Our whole system of religion, and not that alone, but our whole system of polity as connected with religious toleration, depends altogether upon the law in which the Reformation in that country was founded. At the period of the union between the two countries, the Irish Parliament, which had the power either to consent to or refuse that union, stipulated that the Protestant Church as established in Ireland should be maintained on the same footing and on the same integrity as the Protestant Church of England in this country. I therefore entreat your Lordships not to lose sight of the fact; and, above all, not to allow yourselves to be prevailed on to sanction the smallest alteration in it, or to recede from it in the slightest degree, if you wish to maintain the Union between England and Ireland."—The Bishop of Exeter sincerely thanked Lord Fitzwilliam for having elicited from the Duke of Wellington declarations than which nothing could more largely contribute to the stability of the Church of Ireland, to the confidence of the Protestants of the country, and to the joy and gratification of the Protestant community all through Christendom. He said the Church of Ireland held its property of all kinds by the same tenure as noble Lords held their properties; it was derived under the same laws, in many instances, as their Lordships derived their possessions; and it would be quite as just to make such noble Lords "disgorge" for the use of the poor on their estates, the property derived from confiscation of church lands at former periods, as to compel the church to divide its incomes with the clergy of another religion. He would venture to prophesy, that if there were any revolution in Ireland which went to disturb the property of the church, the interval between that and the spoliation of lay property would be a very short one.

Tuesday.—The Three-and-a-Half per Cent. Annuities Bills were read a third time and passed, and the Standing Orders Committee was re-appointed.

Thursday.—Lord Campbell alluded to the short notice allowed to those who objected to the reduction of the Three-and-a-Half per Cents.—The Lord Chancellor said there had been already only three notices of dissent, and he did not think there would be any more. His Lordship then moved the second reading of the Ecclesiastical Courts Bill, on which considerable discussion arose; he gave a sketch of the history of all the attempts to legislate on the subject of the Ecclesiastical Courts, from the issuing of the Ecclesiastical Commission, in 1829, down to the abandonment by the Government of their bill of last year. The chief objects of the present bill are the union of the Court of Arches and the Prerogative Court, the abolition of the various Courts of Peculiars, the amalgamation of the provincial courts of Canterbury and York, &c. But though the abolition of the Diocesan Courts was one of the recommendations of the Ecclesiastical Commission, it has not been adopted in the present bill, which constitutes its prime distinction from the bill of last year.—Lord Cottenham objected to the retention of the Diocesan Courts as contrary to the recommendation of the commissioners and of the committees of both Houses of Parliament, and as contradictory to the opinions of the present Government as expressed in the bill introduced by them last year. He contended that these courts did not adequately perform their duties, and that the same reasons which justified the abolition of the Courts of Peculiars justified their abolition likewise. He objected to many of the details of the bill, and moved as an amendment that it be read a second time that day six months.—The Bishop of London supported the bill, because from all the information he had been able to acquire, and from the fullest consideration of the subject, he thought it the best bill which the Legislature was in a condition to pass, without giving so much dissatisfaction to a great body of the public, as greatly to counterbalance the advantages that might otherwise be derived from a measure of this kind. The bill contained so much good, that he would not be justified in refusing it, although it did not contain all the good that could be desired.—Lord Brougham was sorry the difficulties that surrounded the subject did not enable the Government to bring forward a more complete measure; but, on the whole, he was willing to concur in reading this bill a second time, reserving to himself the right of urging such objections in the committee as might hereafter seem to him advisable.—Lord Campbell desired to know the real motives which induced the Government to abandon their bill of last year, and to introduce the present modified one. It could not be a want of parliamentary power to pass it, for of that they had sufficient to carry any bill they pleased.—The Lord Chancellor replied, that the history of the bill of last year was a sufficient explanation of its abandonment. That bill had been read a first and second time, and after a warm discussion the second reading was carried; but when the bill got into committee, it was so altered as to assume a new form, and in this shape, and without the regulations which the Government considered important, they did not deem it expedient to proceed with the measure. That was the history of last year's bill; and what reason had they to suppose that, if they brought in a similar measure, the same course would not be pursued?—After a few words from Lord Kenyon, the amendment was negatived without a division, and the bill read a second time.

Friday.—The Royal assent, by commission, was given to the Consolidated Fund (8,000,000*l.*) Bill, the Three-and-a-Half per Cent. Annuities Bill; the Three-and-a-Half per Cent. Annuities (1818) Bill; the Gaming Transactions Indemnity to Witnesses Bill; and the Teachers of Schools (Ireland) Bill. The Commissioners were the Lord Chancellor, the Archbishop of Canterbury, and the Duke of Buccleuch.—A long and desultory conversation took place between the Earl of Radnor, the Duke of Richmond, the Duke of Buccleuch, and Lord Beaumont, touching an alleged expression of the Earl of Harewood, to the effect that the Anti-Corn-Law League were in some way connected with incendiarism. The Duke of Buccleuch intimated that the Earl of Harewood never made use of the words attributed to him. Several petitions were presented, and many bills were forwarded in their respective stages.

HOUSE OF COMMONS.

Friday.—After the preliminary business noticed in our last, the House resolved itself into committee on the Factories Bill. On the second clause, Lord Ashley moved an amendment, the object of which was to limit the work of females to ten hours instead of twelve, and of children to eight instead of ten hours. The Noble Lord, in an elaborate speech, exposed the hardships, physical abasement, and mental demoralisation of the over-working factory system, and contended that a change in it, as regards women and children, could not longer be resisted. It affected the physical powers of the people of a vast province; it formed a perpetual grievance which always came uppermost in any civil commotion in that province; it destroyed the social obligation by reversing the position of the sexes; it disturbed the rights of labour by rejecting men from the factories, and filling the workshops with females, who wrought for half the wages of males. It almost annihilated all provisions for domestic economy. He deplored the fact that the milliners of London were sacrificed at the shrine of fashion, and the factory operatives at the desk of competition; and went largely into details, in order to show that all this sacrifice of time, of health, of labour, and even of moral as well as physical power, was eminently detrimental to the character and position of the working classes, of whose condition he professed himself a determined and strenuous advocate. On the subject of the female character of the factory populations, he went largely into detail, eliciting considerable cheering. After adducing statistics on the condition of the male population, he went into that of the female; and appealed to the House whether or not the condition of our factory female population, doomed as they were to everlasting toil, was one in which we could wish to see placed the mothers and the wives of our manufacturing population, in whose hands was placed the character and the conduct of future generations. Dirt, discomfort, ignorance, recklessness, and vice, were the portion of the women and children—the wives and families. They had no time to learn in youth, and they had none to practise in riper age. Everything went wrong in the domestic management, because the woman was taken out of her proper sphere, and the man could not succeed in discharging those household duties which Providence seemed to have assigned exclusively to females. Then, again, if the subject came to be considered under its physical aspect, what a heavy responsibility attached to those who should reject his proposition. He did not believe that there was anybody within the walls of the House who would vote against the interests of the working classes; but he warned them against being swayed by predilections and feelings, and not to be ruled by mere party associations. For himself, he was accused of being an enemy of the aristocracy because he was a friend of the working classes. This he emphatically denied; and trusted that the Divine Being in whose hands were the hearts of all men, would turn the House of Commons to a quick sense of injustice and oppression. His object, speaking generally, was to introduce into the Factories Bill provisions which would make it a "Ten Hours Bill," or, in other words, to restrict the duration of factory labour, and to restrain the overbearing spirit of capital from encroaching on the time, the convenience, and the comfort of labour.—Sir J. Graham said he would boldly under-

take the responsibility of giving his most decided dissent to the amendment. He contended that if the hours of labour were reduced the speed of machinery would be accelerated, and, though those employed would be worked a shorter time, their labour would be in fact greater and more injurious to their health. Besides, a reduction in wages would inevitably follow. Referring to Lord Ashley's comparison between the labour of those employed in agriculture and manufactures, he believed that, taking the comparison as it bore on the happiness of the persons in question, the agricultural labour was more pleasing, but he doubted if it was more healthy, and whether, taking into consideration the vicissitudes of weather to which he was exposed, and the danger arising from wet clothes, the greatest chances of health were not against the agricultural labourer. The master manufacturers had given an honourable and willing assent to the restrictions of the present bill; but yet, on the understanding that although they acquiesced in placing a check on infantine labour, it was because they relied on Government that with reference to twelve hours' labour for young persons, they were resolved to stand firm after having given it the fullest consideration. Sir J. Graham concluded by saying that he was satisfied that holding the balance equally between the employers and the employed, and taking into consideration those topics which he had noticed, that the humane portion of the Bill would meet with no opposition from the manufacturers—that in its present shape it would pass without difficulty; but he believed that if the motion of the noble Lord was agreed to, the proceedings would be inverted and the measure resisted; that so far from benefiting the working classes, for whose interest it was intended, it would, if carried, tend to decrease their wages, although they might enjoy a shorter time of labour—and, above all, the commercial prosperity of the country would be sapped.—Mr. GIBSON and Mr. WARD supported Ministers.—Mr. S. WORTLEY, Lord F. EGERTON, Lord SANDON, and Lord HOWICK, supported the amendment.—Mr. BRIGHT opposed it, and in alluding to the statements made by Lord Ashley on the evils of the factory system, asserted that his Lordship had made use of dishonourable instruments in obtaining his information. One of them was a cripple, named Dodd, who had stated to him that Lord Ashley had used him as long as he could get anything out of him, and then cast him off; that the noble Lord used to give him dinners in his house, and showed him to his friend, and that when he wrote to Lord Ashley for the balance of his account, his lordship wrote him an angry letter, stating how many dinners he gave him as an object of charity.—Lord ASHLEY insisted on Mr. Bright's fully pursuing this charge, and a scene of great confusion ensued, in the midst of which Mr. BRIGHT read some extracts from the letters of Dodd, in which the above allegations were made.—Lord ASHLEY replied that this cripple, Dodd, came to him and represented himself as miserably circumstanced. He appeared a deplorable object; he had lost his hand, and his appearance was altogether very wretched. He did assist him. He believed the statement of his indigent condition, and told him that he was perfectly welcome to come to his house whenever the servants were at dinner. He did come, and frequently dined at his house with the servants. He admitted that this person did go down to the manufacturing districts, and had written to him a number of letters, but he could state that never, unless in one instance, had he stated a single fact on his authority.—On the motion of Mr. WARBURTON, the Chairman reported progress, and the discussion was adjourned.

Monday.—The House went into committee on the Factories Bill, and the adjourned debate on Lord Ashley's amendment was resumed by Mr. WARBURTON, who opposed the amendment, and argued that the free import of corn, timber, sugar, &c., was the only remedy for all the evils complained of.—Mr. BECKETT partially supported the amendment, and deprecated the argument used by Sir James Graham, that the agricultural labourer being as badly off, therefore the factory labourer was to be left to his fate—as unworthy of the reception of the House of Commons. He was for an Eleven Hours' Bill to continue for a year or two previously to the restriction to ten hours, if the change was found to work beneficially.—Sir G. GREY warmly supported the amendment. Ten hours' labour in the day was the time fixed in every other description of work not settled by any law, but as an arrangement between master and servant, with reference to the capabilities of the human frame, and upon no principle of humanity or justice could there be a larger period of labour allotted a manufacturer.—Sir J. GRAHAM went into the whole history of factory legislation. He afterwards entered into details, in order to show that the difference between ten and twelve hours' labour would involve a diminution of 25 per cent. on wages; and declared his strong conviction that nothing would be more fatal than the adoption of a proposition which, under the appearance of diminishing daily toil by two hours, would reduce the returns on capital, lower the remuneration for labour, and affect the whole social comfort and convenience of the working classes. If it were a mere matter of wish and feeling, he would join with Lord Ashley in desiring that no female might hereafter enter the walls of a factory. But we could not legislate on feeling; and in the artificial and highly complicated state of our commercial system, resembling as it did a house of cards, which could not be touched without bringing down the whole fabric, any departure from sound policy would be a precedent of the most dangerous nature.—Mr. M'GEACHY and Mr. COLQUHOUN supported the amendment, and Mr. LABOUCHERE the proposition of the Government. He refused the responsibility of voting with those with whom he had been in the habit of voting. He could not but regret that he differed with them, but having given the subject his best consideration, he would give his cheerful yet decided vote against the amendment of the noble Lord.—Mr. J. FIELDEN denied that anything like ruin to our commerce and manufactures would follow the adoption of the ten hours' restriction of labour; on the contrary, he felt convinced that unless labour was restricted to ten, or yet further to eight hours, our commerce and manufactures would most certainly be ruined. He supported Lord Ashley's amendment, wishing the restriction to be eight instead of ten hours.—Sir R. PEEL contended that though, nominally, the proposition of Lord Ashley was a limitation of the employment of females and children, it was really a restriction of the labour of adult males, who were to be thus limited, with or without their own consent. As, therefore, it would prove very injurious to the interests of the labouring population themselves, he must oppose it, even though aware that many of the supporters of the Government were in favour of Lord Ashley's amendment. It applied to four of our great departments of manufacturing labour—cotton, woollen, silk, and flax; and its effect would be to reduce the time of employment by five hundred hours, or seven weeks in the year. If you thus, by increasing the cost of labour, added to the cost of production (supposing wages were not reduced), what chance could you have of maintaining your position in the neutral markets of the world? It might be done for a short time; but how long? Foreign rivalry would compel the manufacturer to produce at the lowest rate of profit; and it must ultimately fall on the wages of the working population. If he were persuaded that this restriction of the hours of labour would add to the comforts of the working population, he would exclude all regard to a mere rigid adherence to the rules of political economy. But, looking to an artificial state of society—recollecting the hundreds of thousands dependent on the prosperity of commerce—recalling to his memory, what he would never forget so long as he lived, the appalling condition of Paisley, with its twelve and fifteen thousand men out of employment in 1841 and 1842—he could not treat this question as one of mere humanity, without reference to other great considerations. Even agricultural employment was frequently of long duration, as during the time of hay harvest; and if he could carry his own wishes into effect, he would willingly restrict much of the agricultural labour to which, at the most inclement seasons of the year, women were exposed. But, omitting agriculture, look at the departments of industry which were omitted from the operation of this proposed law. Cotton, woollen, flax, and silk factories were to be interfered with; but in a large multitude of those manufactures, classed as the products of Sheffield and Birmingham, and in which large numbers of women and children were employed, there was to be no limitation. Large numbers of women and children were employed in calico-printing, in the manufacture of earthenware, in multifarious occupations involving severe continuous labour in heated and unhealthy atmospheres—were they prepared to legislate for all these? [Several Members replied to this question by loud cheers of assent.] Then, exclaimed Sir R. Peel, 'you must be universal in your legislation, and include females engaged in agricultural labour. [Another cheer of assent answered this question, to the evident surprise of Sir R. Peel.] But he could not enter on a task like this, beyond all human strength, and interfering with the first principles of justice—he could not commence a system of legislation which would require an investigation into the affairs of every private undertaking, and the liberty of every individual. The Government looked only to the general interests of the community, and no matter whether they had a majority or minority with them, they were determined to resist Lord Ashley's proposition as incompatible with the common good.—Lord J. RUSSELL felt the extreme difficulty of the subject. The speech of Lord Ashley, able as it was, had not satisfied him, yet the Government, which now argued so very strongly against any interference with labour, were yet by their present Factories Bill sanctioning the principle, inasmuch as they introduced for the first time in legislation a general limitation of factory employment. The restriction of the employment of women and children did not necessarily imply that of adults, but even if it did, that would be no tenable argument for the sacrifice of the health and comfort of those who were unable to protect themselves. The subject of the Corn-laws could not be excluded from a just view of the question; in this country there was excessive toil and scanty sustenance, and food was a prime element in the cost of labour. He should, however, for the present omit that consideration; but in the hope that a limitation of the hours of labour would compel us to resort to additional supplies of foreign corn, in order to counteract the fall in wages, he would vote for Lord Ashley's motion.—Mr. HINDLEY followed, depicting the condition of the over-toiled factory population, and contending that it was a state of things which ought not to be tolerated in a Christian country. The House became eagerly anxious for a division, and indicated its wishes by noise and inattention.—Mr. COLLETT and Mr. HARDY rose together, the former obtaining a hearing, deprecating all interference with the rights of labour.—Mr. HARDY followed, amid tumultuous expressions of disapprobation. He at last persuaded the House to listen to him; he was followed by Mr. MUNTZ, and Lord ASHLEY having finished the debate by a reply, a division took place, when there appeared—for Lord Ashley's amendment, 179; against it, 170; majority, 9. The result of the division was received with very great cheering, the House both before and after it exhibiting a scene of great excitement.—Sir J. GRAHAM then intimated that he was not prepared to adopt the principle of a Ten Hours Bill, and that therefore there would be another opportunity for the House on Friday to reconsider its decision.

Tuesday.—Lord ASHLEY stated the course he intended to pursue consequent upon the late majority in favour of his ten hours' restriction on factory labour. On Friday he should take the liberty of entreating the House to affirm the proposition of ten hours' labour, by the substitution of the word "ten" for "twelve" in clause 8 of the Bill. Should the House affirm that proposition, he would prepare a clause which should enact that the present duration of labour, twelve hours, should continue from the time at which they might pass the clause, for six months, till the 1st of October, in this year. This would give six months' notice before any change took place. From the 1st of October, this year, the period of labour he proposed would fall down to eleven hours, and continue at that rate for two years, or till the 12th October, 1846, when the period of ten hours' labour would commence.—Sir J. GRAHAM intimated that the Government were determined to oppose it to the utmost; nothing would induce them to accede to any deviation from the period of twelve hours.—In reply to Capt. ROUS, Sir R. PEEL was not aware of there being any foundation for the rumour that her Majesty intends to pay a visit to the King of Prussia at Berlin.—Mr. RICARDO brought on his motion respecting commercial treaties, and moved—"That an humble address be presented to her Majesty, praying that her Majesty will be graciously pleased to give directions to her servants not to enter into any negotiations with foreign powers which would make any contemplated alterations of the tariff of the United Kingdom contingent on the alteration of the tariffs of other countries; and humbly expressing to her Majesty the opinion of this House, that the great object of relieving the commercial intercourse between this country and foreign nations from all injurious restrictions, will be best promoted by regulating our own customs duties as may be most suitable to the financial and commercial interests of this country, without reference to the amount of duties which foreign powers may think it expedient for their own interests to levy on British goods."—Mr. EWART seconded the motion, and adverted to our commercial treaty with Portugal, commonly called the Methuen, negotiated in 1703, as strikingly showing the mischief as well as uselessness of reciprocity.—Mr. GLADSTONE opposed the motion, on the general ground that it was highly impolitic and impracticable to lay down abstract propositions which would preclude us from availing ourselves of whatever circumstances might arise.—Lord HOWICK supported it, believing that the present moment was particularly favourable for its adoption.—After some observations from Sir. J. HANMER, Mr. HUME rose to support the motion, but while he was speaking the House was counted out.

Wednesday.—On the motion of Sir T. FREMANTLE, a new writ was ordered for Hastings, in the room of the Right Hon. J. Planta, who has accepted the Chiltern Hundreds.—In answer to Mr. Turner, Sir J. GRAHAM said that it was not the intention of Government to introduce any enactment which should prohibit interment in ancient churchyards, where, from generation to generation, families had fixed their burial-places.—The County Coroners Bill was re-committed, and the fifth clause amended, after a division.—The Masters and Servants Bill was re-committed, and the three first clauses, with amendments, agreed to. On the 4th clause, on the motion of Sir J. GRAHAM, progress was reported.—The Night Poaching Bill was read a second time.

Thursday.—On the motion of Sir T. FREMANTLE, a new writ was ordered to be issued for the borough of Christchurch, in the room of Sir G. Rose, who has accepted the Chiltern Hundreds.—Mr. WYSE presented a monster petition from Ireland, praying for inquiry into the recent state prosecution.—Mr. EWART brought forward a motion "that it is indispensable to the maintenance and extension of the trade of this country, that those duties be repealed which press on the raw materials of manufacture, especially the raw materials of the woollen and cotton trade: that it is expedient also that those duties be greatly reduced which press on articles of interchange in return for our manufactures; especially such articles of interchange as, at the same time, concern the subsistence of the people; being, (besides corn, which is the subject of superior and separate consideration) such articles as tea, sugar, coffee, bacon, butter, and cheese: that it is expedient that those duties also be greatly reduced which, by their amount, encourage smuggling; being at once injurious to the revenue and dangerous to the morality of the country; such as the duties on tobacco, silk goods, and foreign spirits: that whatever temporary deficiency of revenue be caused by such reduction, ought, until the revenue regain its former amount, to be sustained by the property, and not by the trade and labour of the country." During his speech it was moved that the House be counted, and only thirty-eight members being present the House adjourned.

Friday.—Among a great number of petitions on various subjects, Mr. O'CONNELL presented a number from Ireland, complaining of the manner in which the late Irish State trials had been conducted; and other petitions, signed by upwards of 150,000 persons, in favour of a repeal of the legislative union.—Mr. GILL called attention to the case of Capt. Brewster, of the 76th Reg., who has been under arrest for 8 months, and asked for the production of papers.—Sir H. HARDINGE said, he had the greatest possible objection to produce the papers asked for. What had been done had been sanctioned by the Com.-in-Chief, and it would be detrimental to the discipline of the Army, were they to be published. There was no imputation on the character of Capt. Brewster.—Mr. GILL was satisfied with this explanation.—Mr. W. PATTEN presented a petition signed by twenty-two of the principal firms of Preston, stating that the petitioners had heard with the utmost alarm that the House had come to a resolution limiting the hours of labour to ten, and praying the House not to consent to such an enactment.—Lord ASHLEY presented 91 petitions from various districts in the West Riding of Yorkshire, in favour of a ten hours' clause.—Mr. FIELDEN presented a petition in favour of limiting the hours of labour.—The SPEAKER then left the Chair, and the House resolved itself into Committee on the Bill, when Lord ASHLEY (on the second clause being read) said, he thought it would be better to reserve what observations he had to make respecting the laws of labour until the eighth clause was under the consideration of the House.

CITY.

Money Market, Friday.—Consuls for Money and the Account have varied from 97⅞ to 98⅝; sales have been made to invest in the Three-and-a-Half per Cents. Bank Stock has reached 200½; Indian Stock, 293½, and Exchequer Bills, 71*s.* prem.

GAZETTE OF THE WEEK.—BANKRUPTS.—C. STAPLES, of Southampton, milliner—J. E. RIDOUT, of Ringwood, Hampshire, wool-draper—J. DEACON, of White-chapel-road, draper—H. GOERTZ, of New Windsor, Berkshire, upholsterer—M. and R. RAMSAY, of Scotswood, Northumberland, paper-manufacturers—J. FINNEY, of Woore, Shropshire, builder—J. HOWARTH, of Lee-mill, Lancashire, cotton-spinner—G. HARDING, of Carlisle, Cumberland, tea-dealer—W. P. WARD, of Liverpool, grocer—W. CHAPMAN, York-place, New-road, surgeon—J. GUNDRY, High-street, Hampstead, shoemaker—J. COWEN, Penrith, Cumberland, linendraper—H. S. HEWITT, Manchester, victualler—F. FORD and F. R BROCKLEHURST, Bow-lane, wholesale stationers—G. and J. WILKINSON, Bishop Auckland, Durham, carriers—E. ROGERS, Newport, Monmouthshire, fire-brick manufacturer—H. HURST, Newcastle-upon-Tyne draper—T. F. CLARK, Scotland-road, Liverpool, draper—H. W. HEMSWORTH, Primrose-street, Bishopsgate-street, wine-merchant—J. MAYS, Langley-place, Commercial-road-east, hard confectioner—T. HODGSON, Greetta-bank, Lonsdale, Yorks., brickmaker—T. SHILLITO, Leeds, chemist.

Metropolis and its Vicinity.

Royal Society.—The Marquess of Northampton, as President of the Royal Society, held his third *conversazione* on Saturday night, at his mansion in Piccadilly. It was the fullest meeting this season, above 500 Fellows of the Royal Society and visitors being present. The noble President was sufficiently recovered from his recent indisposition to be able personally to receive his visitors.

The Duke of Sussex's Library.—By the will of the late Duke of Sussex it was directed that if Government did not purchase his library within one year after his Royal Highness's decease, it was to be sold by auction. The King of Prussia is now in treaty for the purchase of the collection, which consists of upwards of 45,000 volumes, the whole of which have been catalogued, and the list transmitted to his Majesty. It is not known what value is placed upon them by his Royal Highness's executors. Even at the average of only half-a-crown a volume, they would realise nearly 6000*l.*

Excise Prosecutions.—The Excise authorities have recently been very active in putting down the adulteration of tobacco, by special inspections and prompt prosecution and conviction where frauds have been detected. The following cases have been brought before the local authorities within the last few weeks, and the parties have been fined in the sums named, viz., Mr. Tickle, of Bolton, 150*l.*; Mr. Laffer, of Liverpool, 300*l.*; Messrs. Nichols and Gough, of Chester, 300*l.*; Messrs. Wood and Son, of Doncaster, 150*l.*; Messrs. Gartons, of Lincoln, 250*l.*; Messrs. Gamble, of Gainsborough, 600*l.* The case at Gainsborough occupied the magistrates the whole of Thursday and Friday last, and was conducted by Dr. Bateman, of London, for the Excise, and by Mr. Cartwright, of Bawtry, for the defence. One of the witnesses for the Crown was Professor Graham, of London University, who had analysed the adulterated tobacco.

Carlton Club.—At a general meeting of the Carlton Club on Saturday last it was resolved to invite a competition of architects by offering premiums of 200*l.* for the best, and 100*l.* for the second best plan for the intended club-house in Pall-mall.

The Order of St. Joseph and Mary.—On Sunday evening Mr. O'Connell was admitted a member of "The Holy Order of St Joseph and Mary" by the Rev. J. Moore, at Virginia chapel, Ratcliffe Highway. Mr. O'Connell arrived in a carriage, drawn by four greys, about half-past three, at which time several thousand persons, principally Irish, had collected, and gave him an enthusiastic welcome. Several gentlemen dined together in a house adjoining the chapel, and at seven o'clock the religious services commenced. There were present about 300 members of the order, the females being habited in green dresses, with sashes and white bonnets, the males in green cloaks, trimmed with fur, white collars, and caps similar to those worn at the Universities. Vespers having been performed, Mr. Moore explained at some length the origin of the "orders," or "guilds," and said he was happy to see among them one of whom the supreme pontiff had said, and truly said, that he was the most illustrious lay member of the church of Rome. With Mr. O'Connell they all felt deep sympathy, and there was not one amongst them who would not heartily wish him a long and happy life. The investiture then commenced. Mr. O'Connell advanced to the steps of the altar, on which he knelt, and Mr. Moore placed on him a green silk cloak, lined with white silk, and trimmed with ermine. He also presented him with a gold cross, and placed on his head a velvet cap. The usual devotional exercises having been performed, the congregation dispersed. A procession was then formed, which marched in order to the Philanthropic Institution,

Sandwell, where an address was presented to Mr. O'Connell, from which the following is an extract:—"Every wise man esteems you, every good man loves you, every Catholic exults in you. We esteem you as a chosen servant of God, a mighty instrument in his hand for the accomplishment of the designs of his providence, and as a second Constantine in the history of the Catholic Church; for as the great Constantine emancipated the Church from Pagan tyranny, the catacombs of Rome, and the cruelties of the Colosseum, so in these kingdoms have you delivered her from the thraldom of religious bigotry, and the bonds of penal enactments. Like another Moses, you have rescued her from her worse than Egyptian bondage, and led her through the Red Sea and the wilderness, and like Joshua you have brought her through the Jordan, and placed her in the Canaan of freedom and prosperity." Mr. O'Connell acknowledged the compliment, referring to the progress of the Catholic faith in England, and to the numerous conversions which had recently taken place. He also alluded to the efforts he had made for emancipation and repeal, and concluded amidst loud cheers.

Poor-Law Amendment.—A numerous meeting of deputations from various Metropolitan parishes was held last week at the Marylebone Court-house, for the purpose of considering certain clauses in the bill now before Parliament for altering and amending the Poor-law Act. Amongst the deputations in attendance were those from St. Luke's, Middlesex; St. James, Westminster; St. George's, Hanover-square; St. James, Clerkenwell; St. Pancras; St. Mary's, Islington; St. Margaret's, St. John's, and St. Leonard's, Shoreditch. Mr. Kirby, a barrister, was in the chair, and the following resolutions among others, were unanimously adopted. "That the Poor-law Amendment Bill, now before the House of Commons, contained provisions which if enacted will increase the arbitrary power of the poor-law commissioners, subvert the ancient independence of local boards, and repeal, without express enactment, important and valuable privileges, by depriving rate-payers of the control over their own resources in the administration of relief to their local poor."—"That the proposed establishment of district schools will not only entail additional expenses upon the rate-payers, but will tend to aggravate the miseries of pauperism, by removing children away from their parishes; or will curtail the opportunity of communication with their parents, and alienate them from the legitimate influence of local guardians and the superintending clergy."—"That the proposed establishment of district asylums for the casual and houseless poor will tend to increase vagrancy rather than legitimately provide for destitution; and that the proposed incorporation of parishes having local acts for such purpose will subject them to the control of the poor-law commissioners, by including them in a district for the auditing of accounts, thereby interfering with the duties of other auditors already appointed under local and general statutes." A deputation was then appointed, to be composed of members of Parliament, churchwardens, and chairmen of the boards of guardians of the different Metropolitan parishes, to wait upon Sir J. Graham with reference to modifications in the bill so that it may not interfere with parishes under local acts.

New Royal Exchange.—At the meeting of the corporation for improving the approaches to London-bridge held last week, the deputation appointed to confer with the Commissioners of Metropolitan Improvements on the question of obtaining further space at the east end of the new Royal Exchange made their report. The deputation consisted of Mr. R. L. Jones, chairman of the Exchange committee, Mr. W. Lawrence, and Mr. R. Taylor, attended by Mr. Tyrrell the Remembrancer, and Mr. Tite the architect of the new building. It appears that the deputation have had several interviews with the Commissioners, and that they submitted their plans or suggestions for those improvements. The first suggestion was to make an opening into Finch-lane, the same in character as that which was made in Fleet-street called St. Bride's passage, but wider; the width of the Finch-lane opening being proposed at 60 feet from house to house, and 30 feet between the shops. The second suggestion proposed the same opening, but included the widening of the main street at the east end of the 'Change to 60 feet instead of 46 feet 6 inches as at present. The third plan proposed the taking down of Finch-lane altogether, and the construction of a new street 70 feet wide at the east end of the 'Change in its place. All the plans contained a suggestion for widening Threadneedle-street from the Royal Exchange up to Merchant-Tailors' Hall. The application on the part of the corporation was supported by a memorial from the merchants, bankers, brokers and traders of the City; signed by all the first names in the City. In opposition to further improvement in this quarter, Magdalen College appeared by their steward Mr. Blagrove, and Mr. Sheriff Moon their tenant. After hearing evidence from all these parties, the Commissioners, it appeared, determined that a more extended space at the east end of the new Exchange would greatly conduce to the effect of the building and the convenience of those who might frequent it; but that looking to the numerous and important claims upon any funds which might be provided by the Legislature for improvements in the Metropolis, they could not feel justified in recommending to her Majesty, or to Parliament, that any advance of money from public sources or from local taxation should be made for this purpose.—On Wednesday the citizens obtained, for the first time, an unobstructed view of the façade of this structure, the houses intervening between it and Cheapside having at length been levelled. The Wellington statue will supply their place.

Jewish Orphan School.—A few days since, Mr. L. Moses, of the firm of Moses and Levy, in Aldgate, presented to the treasury of the Jewish Orphan School in Goodman's Fields, a check for 2000*l.*, to purchase a plot of ground for the purpose of building thereon an asylum for the institution; at the same time expressing his desire that the building should be erected at his sole expense, and he would give a further sum for its completion, should it be required. This benevolent gentleman a short time since erected, at his own expense, a number of almshouses in the Globe-road, Mile-end, for aged and decayed tradesmen of the Jewish persuasion, to whom he allows a certain sum of money weekly.

New Zealand Company.—The 10th Annual Meeting of this Company took place last week. J. Somes, Esq., in the Chair. The Secretary read the following report:—"When the advertisement calling this meeting was issued, your directors anticipated that it would have been their duty to submit to you to-day a statement of the condition of the Company's affairs, and to recommend to you, in consequence, the adoption of certain proceedings. They have now to inform you, that it is not in their power to fulfil any part of that intention, and to acquaint you briefly with the ground of their present reserve. When they call your attention to the fact that the Company has been engaged for five years in forming settlements whose population now exceeds 10,000 souls, at a cost of above 50,000*l.* (besides a much larger outlay by the settlers themselves), but that its title to the land is yet unsecured by the grant of a single acre from the Crown; and when you reflect on the consequence, as respects safety of property, and even life, of recent events in New Zealand, you will not require any further reference to the causes of this calamitous state of things in order to understand that the Company is at this moment deprived of all means of usefulness as an instrument of colonisation, and in great danger of becoming a total wreck as respects even the property of the shareholders and the settlers. Under these circumstances your directors have been compelled to suspend entirely the proceedings of the Company as a colonising body, and they have made representations to Her Majesty's Government of the actual state of your affairs, in the hope that some arrangement may be made by which the confidence of the public in the Company's powers of usefulness may be restored, both here and in New Zealand. It is this confidence, your directors feel perfectly satisfied, which is alone wanting to enable the Company to carry out the objects of their incorporation on a continually increasing scale. With this confidence, the most sanguine of the views of the founders of this Company may be realised, but without it you must of necessity retire from an enterprise, the further pursuit of which, unless the causes of its present failure be removed, can only result in more extensive disappointment and ruin. Your directors anxiously trust that the representations they have made to the Secretary of State for the Colonies on this subject may be favourably received; and they suggest to you the propriety of adjourning the meeting for a fortnight, without asking further explanation of them, or adopting any other resolution, until it shall be in their power to lay before you the final result of their correspondence with his Lordship." After a brief discussion the report was adopted, and the meeting adjourned until the 29th.

St. Patrick's Day.—On Saturday the annual dinner of the Benevolent Society of St. Patrick was celebrated in Freemasons' Hall, but unlike most former festivals, there were scarcely 80 persons present. Lord Morpeth presided, supported by Lord Rossmore, General l'Estrange, Right Hon. A. R. Blake, Hon. Mr. Villiers Stuart, M.P., Sir. R. Howard, M.P., Sir T. B. Lennard, David Ross, Esq., M.P., and the Hon. W. Stopford. After the usual toasts, donations were announced to the amount of 793*l.*

City of London School.—The Corporation having devoted the fine of 400*l.* paid some years ago by Mr. Tegg, bookseller and publisher, to be excused from serving the office of sheriff, towards the establishment of an exhibition to one of the universities for the benefit of pupils of the above school, Mr. Tegg has manifested his approval of such an appropriation by recently making an addition to the fund of 100*l.*; and in return for this liberality, the committee of the school have agreed that the exhibition shall in future be designated "The Tegg Scholarship, or Exhibition." Mr. Tegg has also accompanied his gift with a number of books for the library of the school.

Anti Corn Law League.—The usual Weekly Meeting of the League took place on Wednesday night in Covent Garden Theatre. The Earl of Radnor presided, and addressed the meeting at great length. His Lordship was loudly cheered by a crowded house; and the other speakers were Mr. C. Lattimore and Mr Hunt, tenant farmers, and Mr. Cobden.

East India-House.—A General Court was held on Wednesday; Mr. J. Cotton in the Chair. It was stated that the India Board had sanctioned the grant of an annuity of 200*l.* a-year to Capt. Patterson. The motions respecting the money payments to the temple of Juggernaut, and the affairs of Scinde, &c., after some discussion, were ordered to stand over to the next meeting.

New Hospital for Consumption.—Prince Albert has consented to lay the first stone of a new building to be erected at Chelsea, for the relief of persons labouring under pulmonary diseases. The design for the building is by Mr. Francis, and is in the Tudor style. The ceremony of laying the foundation stone will take place in June next, when there will also be a fancy fair in the gardens of Chelsea Hospital in aid of the funds.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending March 9—West Districts, 138; Northern, 181; Central, 182; Eastern, 226; Southern, 303; Total, 1030. Weekly average for the last five years, 946.

Provincial News.

Agricultural Meetings.—Since our last report the following meetings in favour of Protection have been held:—On Thursday at Tarporley, Sir P. G. Egerton, Bart., in the chair, supported by a great number of influential landlords and farmers of the district.—On Friday at Wimbourne, Mr. R. Easton, of Moortown, in the chair, supported by the principal Agriculturists of Dorset.—On the same day, at Aberdeen, Robert Grant, Esq., of Tillyfour, convener of the county, in the chair, supported by the leading landowners and farmers of the county, the requisition for the meeting having been signed by nearly six thousand persons.—On Thursday at Bingham, Mr. Barrow, of Southwell, in the chair, supported by the leading landowners and tenant-farmers of Nottinghamshire.—On Saturday, at Bourn, W. Parker, Esq., of Hauthorpe, in the chair, supported by a large number of the Agriculturists of Lincolnshire.

Chelmsford.—The convictions at the recent assizes for Essex and the adjoining counties, have not in the least subdued the prevailing spirit of incendiarism in these districts, as no less than seven instances have occurred since the termination of the assizes, viz., at Stowmarket, Bacton, Freston, and Tuddenham, in Suffolk; and at Tendering, Rayne, and Braintree, in Essex.—On the 11th inst., as Mr. John Saunders, jun., son-in-law of Mr. Blyth, of Springfield Dukes, was on his way on horseback from that place to his farm at Purleigh, when at Danbury his horse shied, and at the same instant fell. The animal on rising reared up, when Mr. Saunders, who to this time had kept his seat, sustained a severe injury from the pommel of the saddle. Medical assistance was at once procured, and Mr. Bransby Cooper attended from town, but Mr. Saunders died on Wednesday week. An inquest was held, and a verdict of Accidental Death returned.

Coventry.—A meeting was held on Monday in St. Mary's Hall, "to take into consideration the grievances of Ireland." Mr. O'Connell was present, having been invited to take part in the proceedings. Mr. Whittem, the Mayor, was in the chair. The novelty of the occasion caused a great number of people to assemble; the consequence was, that some of the barriers were broken down from the pressure made against them, and several individuals were more or less injured. A cry was raised to adjourn the meeting to the open air, but the Mayor refused to comply. Uproar of a most furious kind succeeded, and not a word could be heard. At length the Mayor stood up and declared that he would not adjourn the meeting, or submit to such interruption. The uproar was renewed, but after some time gradually subsided. Mr. Gordon, a Unitarian preacher, moved the first resolution, and Mr. Sibree, an Independent minister, moved the second resolution. Mr. O'Connell spoke at great length upon the grievances of Ireland, and recapitulated all the arguments for Repeal which we gave at length in our account of the Covent-Garden dinner. Resolutions condemning the late trials, and expressing sympathy with Ireland, were then carried.

Dorchester.—A county-meeting was recently held in this town, for the purpose of considering the measures to be adopted for the erection of a monument in this his native county to the memory of the late Admiral Sir Thomas Hardy, in commemoration of his public services. The Earl of Ilchester presided. A resolution that a monument be erected, was carried unanimously. Capt. Manning, Governor of Portland Castle, then said that the inhabitants and merchants of Portland would feel a pleasure in presenting the whole of the stone required for the proposed structure, should the "Vern" be selected as the site. Mr. A. H. D. Acland proposed as the site of the testimonial one of the elevations of the Blagdon Hills, that spot overlooking the native parish of the late Admiral, being a portion of the property of his family, and so conspicuous, to a considerable extent, both by land and by sea, as to have been selected by the Admiral himself for the site of a mark when in command of the experimental squadron in the Channel. Capt. Hawkins, R.N., seconded the resolution, which was adopted. Mr. Manfield, as a relative of the deceased Admiral, offered any portion of the land required for the site, and also gave permission to quarry the stone for the building, and the use of such other materials as his estate afforded.

Durham.—A letter has been addressed by the Marquis of Londonderry to the chairman of the Agricultural meeting held in Durham on the 20th ult., expressive of his Lordship's concurrence in the objects of the society. The following is an extract:—"As a landholder both in England and Ireland, I shall ever be ready to uphold my own position and interest, and advocate the claims of that class I feel bound, although humble, to protect; and I beg the favour of you to add my name to any resolution or arrangement which may be determined on at the meeting by his Grace the Duke of Cleveland and the farmers of the county of Durham. I have read with considerable satisfaction his admirable letter, in every word of which I cordially agree. But I beg to repeat to the farmers of the county of Durham, what I have long since stated to my numerous and excellent tenantry in Ireland—that it is prudent and wise for them to prepare for the worst; for after the extraordinary and inexplicable changes in the times we live in, no man can venture to predict or to speculate with certainty on what may occur."

Ipswich.—About 1 o'clock on Monday, while following the stag-hounds in the neighbourhood of this town, a fatal accident occurred to Lord William Hill. It appeared that his Lordship was hunting in Bramford Park, the seat of the Dowager Lady Middleton. Having mounted his horse, which he took from the hands of his servant, near the house, his Lordship seems to have dashed down the park, riding his horse at the very top of his speed.

At the bottom of a hill there is a pond, and in endeavouring to turn the horse so as to avoid it, the animal, in the highest state of excitement, bore his Lordship with so much violence against a large tree as to knock him from his seat, and cause instant death. The trunk of the tree jutting out considerably, the unfortunate nobleman's head came in contact with it. No fracture took place, and there was scarcely an appearance of violence; but so intense was the shock, that his Lordship appears not to have moved or breathed after his fall. An inquest has been held on the body, and a verdict of Accidental Death returned. The accident threw a deep gloom over Ipswich and the regiment to which the deceased nobleman belonged. Lord William Hill was the third son of the present Marquis of Downshire, and was only in his 28th year. He had entered the Scotch Greys in 1834, and his commission as Lieutenant is dated October 21, 1836. He was much esteemed in his regiment, as well as by a large circle of private friends.

Leeds.—A numerous meeting of the inhabitants of Leeds, convened by the Mayor, in compliance with a requisition signed by men of all parties, was held last week, to promote the passing of an efficient legislative measure for regulating the working of labourers in factories, and for limiting the labour of young persons between 13 and 21 years of age to ten working hours per day for five days in each week, and eight hours on the Saturday. Mr. Joshua Hobson presided, and the meeting was addressed by Mr. Bulmer, Rev. Dr. Hook, Mr. Oastler, and other gentlemen; after which resolutions in accordance with the objects of the meeting were carried.

Liverpool.—On Saturday evening, a fire broke out in a shed, the property of W. P. Freme, Esq., situate between Hoyle-street and Vendre-street, east of the Victoria Dock, which soon became a mass of ruins. In the shed was stowed about 2000 bales of cotton, and from 100 to 150 tons of sulphur, which made a blaze that was seen for miles. On the alarm being given, the doors of the shed were broken open, and a stream of blazing sulphur ran down the street towards the docks, which was not extinguished until it was drenched with water from the main. The attention of the firemen was then directed to the mass of burning materials inside, of which scarcely anything can be said to have been saved, with the exception of that portion of the sulphur which may be left beneath the charred surface of the mass. Of the building itself nothing remains beyond the outer walls, which must be taken down. Of the origin of the fire nothing is known. No suspicion has been expressed of anything like incendiarism. The damage, exclusive of the building, cannot be fixed at less than 20,000*l.*—Another fire broke out on Wednesday in this town on the premises of Mr. Clay, chemist in Bold-street, by which property was destroyed to the amount of 1000*l.*

Manchester.—On Thursday week the whole of the valuable works contained in the depository of the Society for Promoting Christian Knowledge, situate in this town, were destroyed by fire. The fire was subdued in less than a quarter of an hour, but not until the whole of the stock was destroyed and the building nearly gutted. The origin of the fire cannot be accounted for. The damage is estimated at between 800*l.* and 900*l.*—The local papers state that in consequence of the numerous fires which have lately occurred in this town, the Railway company have converted many of their arches into stores for the reception of goods, and that as the arches are fireproof, the adoption of this plan saves the expense of insurance.

Newcastle-upon-Tyne.—On Thursday the 14th, a poor woman named Sherwood was murdered in this town by her husband, a man of dissipated habits, who enjoyed a small pension as a soldier in the artillery. He had cut his wife's throat with a razor, and then drank such a quantity of whisky that when discovered he was in a state of stupefaction, which rendered his recovery doubtful. He was, however, restored, and has been committed to take his trial on the capital charge. An illicit still was found at work on the premises.

Nottingham.—Some time ago Mr. James Osborne, of Newark-upon-Trent, in this county, was robbed of a considerable sum of money by a man in whom he had placed great confidence. This circumstance preyed so deeply upon his mind as to produce an aberration of intellect, and on the 15th February last, he attempted to commit suicide. He was, however, prevented from doing this, and since that period has never been suffered to be by himself; but from that time he steadfastly refused to take the slightest nourishment, and even treated with violence any person who offered him food. On the 29th ult. he died from exhaustion; an inquest was held on his body, and a verdict accordingly returned.

Oxford.—Letters have reached Oxford from Rome, announcing the conversion to Popery of C.R. Scott Murray, Esq., M.P. for Buckinghamshire. He was at Rome two years ago, in the company of Mr. Douglas, a member of the same college (Christ Church), and hearing a report that Mr. Newman and Dr. Pusey were to be expelled from the Church of England, he made up his mind, together with his companion, to join the Church of Rome. Mr. Douglas did so, but Mr. Murray was compelled to return home to his parliamentary duties, and postponed his resolution until the present time.

Portsmouth.—The Lords of the Admiralty have ordered the following ships to be built:—The Royal Sovereign and the Windsor Castle, three-deckers, similar to the Queen; the St. Jean d'Acre and the Marlborough, 90-gun ships, similar to the Albion; the Brunswick and the Cressy, 80-gun ships: the Brunswick to be upon the model of the Vanguard, and the Cressy upon the lines of the members of the late School of Naval Architecture. Four 50-gun frigates, similar to the Vernon, are to be built, viz., the Liffy, Arethusa, Shannon, and Severn.

Southampton.—The local papers state that the principal merchants of London are about to memorialise the Treasury that Southampton may be appointed as the Channel Islands Packet Station instead of Weymouth.—At the recent meeting of the Southampton Dock Company the report stated that the expenditure from the commencement of the undertaking to the 31st December last has been 336,399*l.* 3*s.* 1*d.* of which 23,674*l.* 2*s.* 1*d.* was incurred during the past half-year. A warehouse with spacious vaults for bonding wines and spirits, and proper accommodation for bonding corn is in progress, which will put the company in a condition to receive general cargoes, the class of business to which it necessarily looks for a revenue. They have also constructed a spacious yard for foreign timber, which has already received several cargoes. The contractor for dredging the approach called the Itchen Channel is actively at work, and will, it is expected, by midsummer have accomplished a minimum depth of 16 feet at low water of spring tides. The directors also announced that they had acted on the principle of low rates of charge, as the means of attracting a larger amount of trade.

Stafford.—The workmen in the collieries of this county have again struck for an increase of wages, and out of 52 collieries only 17 are in full work and 4 in partial work. A considerable number of coal proprietors have acceded to the request of the men—to give 3*s.* for a day of eight hours, and in consequence of that the anticipated strike has been less serious than was apprehended. Several large proprietors, however, still resist the demand, because they believe the present is only considered by the men an instalment of a further and more serious demand to be shortly made. There seems to be no reason to apprehend any disturbance. The movements of the colliers are closely watched by the police, and there is a strong military force at hand, to quell any disorder that may arise.

Tavistock.—The first case where the tithe-owner has been compelled to take proceedings for the purpose of taking possession of the land itself, which has occurred in this county (and which is believed to be the first under the late Tithe Commutation Act,) has occurred in the parish of Peter Tavy, the Rev. W. Macbean, the rector, having been driven, in consequence of there being no sufficient distress on the premises, to take such proceedings for the recovery of two years' arrears of rent-charge due in October last, the time limited by the act. By virtue of the writ directed to the Sheriff, a jury was summoned a few days since to assess the arrears of the rent-charge due; but previously to this, the rector's solicitors received an undertaking to pay the arrears of rent-charge claimed, together with the costs.

Wednesbury.—On Saturday morning the housekeeper of John Crowther, Esq., of Oakswell End, in this town, was murdered by some person unknown, who first beat her on the head with a hammer, and then cut her throat with a desert knife. A man who formerly lived in the house as a servant has been apprehended on suspicion.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1224*l.*; Birmingham and Gloucester, 1931*l.*; Eastern Counties, 3415*l.*; Edinburgh and Glasgow, 1971*l.*; Great Western, 11,544*l.*; Grand Junction, 6689*l.*; Glasgow, Paisley, and Ayr, 1270*l.*; Great North of England, 1555*l.*; London and Birmingham, 13,500*l.*; South Western, 4600*l.*; Blackwall, 544*l.*; Greenwich, 636*l.*; Brighton, 2381*l.*; Croydon, 192*l.*; Liverpool and Manchester, 3771*l.*; Manchester, Leeds, and Hull, associated, 5642*l.*; Midland Counties, 2106*l.*; Manchester and Birmingham, 2858*l.*; North Midland, 3779*l.*; Newcastle and Carlisle, 1364*l.*; South Eastern and Dover, 2508*l.*; Sheffield and Manchester, 495*l.*; York and North Midland, 1479*l.*—A special meeting of the South Eastern and Dover Company was held on Tuesday, to determine on the propriety of authorising the Directors to raise by the issue of additional shares, a sum not exceeding 896,000*l.*, for the purpose of providing for a corresponding amount of securities, and to pay off liabilities, amounting to about 600,000*l.* They had also to consider the draught of a proposed bill to enable the company to alter and improve the harbour at Folkestone, to make a branch line and approaches thereto, alter the levels, and enlarge the station accommodation at Maidstone; and also to enable the Company to make a branch line from Ashford to Canterbury, Ramsgate, and Margate. A resolution was passed unanimously, empowering the Directors to raise the sum of 896,000*l.*, by an issue of 28,000 new shares, which would make the total capital 3,325,000*l.* Other resolutions were passed for improving Folkestone Harbour, and for the extension of the line from Ashford to Canterbury, Ramsgate, and Margate, the cost of which was calculated at 400,000*l.*—At the Manchester and Leeds meeting an increased dividend of 3½ per cent. for the half-year has been declared on the paid up capital of the 100*l.* and the 50*l.* shares, the dividend on the quarter shares remaining as before, at 5 per cent. The working of the railway is improving in a satisfactory manner, and the total income for the last six months has reached 132,345*l.* The revival of trade is stated to have produced a desirable change in the traffic returns, which have weekly showed an increase since the last report, while the gross excess of receipts as compared with last half-year amounted to 13,231*l.*, of which 11,533*l.* had accrued from an increase in the carriage of merchandise.—At the meeting of the Glasgow and Greenock Company last week, a dividend of 5*s.* per share on the 25*l.* shares, and a dividend of 2*s.* 6*d.* on the 12*l.* 10*s.* shares, were declared, the net profits divisible for the half-year, after deducting expenses, &c., being 6168*l.* The number of passengers carried on the line during the last six months, was 424,779. The Directors are exercising much economy to increase the revenue of the Company, and the idea of an extension of traffic by steam-boats appears to meet general concurrence.

IRELAND.

Dublin.—The weekly meeting of the Repeal Association took place on Monday at the Conciliation-hall, Mr. J. H. Dunne in the chair; there were very few persons in attendance. Two letters from Mr. O'Connell were read, in the first of which he alludes as follows to the recent demonstrations in this country:—"You cannot form the least idea of the transcendent scene at Covent Garden last night; there never was anything so splendid; I never was so greeted, even in Ireland. This is indeed cheering, and shows that there is in England more of kind and generous feeling towards Ireland and the Irish than has hitherto had an opportunity to display itself. Nothing can, or ought to have a greater tendency to generate cordiality between the people of both countries than the occurrence in this country respecting the recent trials. This is a sentiment which we are bound to cultivate and encourage by all means in our power." In the second letter Mr. O'Connell refers to a correspondence which has been published between the Rev. Sir J. King and the Association. It appears that Sir J. King felt himself under some obligation to Mr. O'Connell for the services he had rendered to his father, the late Sir A. Bradley King, and accordingly sent 20*l.* to Mr. O'Connell towards paying the legal expenses of his trial, but as a token of gratitude intended solely for himself personally, and not at all for the benefit of the Repeal Association. Mr. O'Connell did not acknowledge the money or reply to the letter, and when the Rev. Bart. made inquiry after it, he was told that it was duly funded with other repeal Rent, and he was supplied with a receipt in due form from the Repeal secretary. Sir J. King, not being a repealer, complained of this proceeding, and the result was the return of his money and a letter from Mr. J. O'Connell, commenting with severity on Sir J. King's conduct. In reference to this affair, Mr. O'Connell in his second letter says—"I am sincerely sorry for the mistake that the Rev. Sir Jas. King has caused. It is manifest that his intentions were good and kindly; but he sent the money expressly for the 'legal expenses I was involved in,' and the money was allocated accordingly. I do wonder that he does not see that the mistake was exclusively his own. You will, I trust, prevent any harsh construction being put on his correspondence. John O'Connell has said quite enough on the subject; but he could not probably say less." He also announced his intention to be in Dublin in a few days, so as to have another pacific address to the Irish people before Term. The secretary announced the receipt of the following sums from America:—From Newfoundland, 50*l.*; Chicago, 28*l.*; Charlotte-town, Prince Edward's Island, 40*l.*; Charlestown, South Carolina, 50*l.*; Halifax, Nova Scotia, 140*l.*; and from Cape Breton, 43*l.* 4*s.* The rent of the week, including 350*l.* from America, amounted to 591*l.*—St. Patrick's day passed off on Sunday without any of the usual ceremonies, and the "guard mounting" only attracted about 50 persons. The weather has been very severe in Dublin and along the coast. The Georgiana of Liverpool has been lost at Wexford, and 14 persons drowned. Among the other casualties reported, we learn from Tarbert that Lieut. Nicholls of H.M.S. Dwarf, and one of his men, were drowned in the attempt to assist the crew of a yacht, which had broke adrift in that harbour. At Belfast a similar accident occurred, Lieut. Victor, R.N., and his crew consisting of eight men in going down to the hulk at Garmoyle having been upset in a squall and drowned.

The Assize Intelligence from the provinces has been a leading topic during the week. At King's County Assizes, after a trial of two days, Thomas Dowling was found guilty of the murder of Mr. Gatchel. He was tried at a former assizes, but the jury disagreed. The principal witness for the prosecution was an approver named Dunne, the convict's own brother-in-law. Mr. Gatchel was agent to the landlord under whom Dowling held some land, and a short time previous to the murder had distrained him for rent. His death seems to have been the result at once of desperation and revenge.—At the same assizes true bills were found against John Gill and Peter Dolun, for the murder of the Earl of Norbury, but it was ultimately resolved by consent to postpone the trial.—A young man named George Jubee was found guilty of the murder of Adjutant Mackay, of the 5th Fusiliers, and sentenced to death.—At the Antrim Assizes, John Cordery, a private in the 66th, was tried for the murder of Sergeant Dodd, of the same regiment, at Belfast on the 29th February, and convicted. The jury recommended him to mercy "on account of the close intimacy that existed between the parties at the time of the occurrence." Judge Perrin said he could not entertain the recommendation.—At Kilkenny two men called Dowling were charged with the murder of Mr. Mortimer, at Freshford. The evidence for the prosecution was that of Delany the approver, but on his cross-examination he admitted being concerned in the murder of Mr. Hoyne, since the above murder. He also admitted that he had been at the beating of two Connaught men, but he could not say if either of them died. He went to steal a cow from a man who owed him 20*s.*, but did not do so. He broke into a house at night, and took a pistol one day. He was with those who robbed a man of his papers. The Jury after this found the prisoners Not Guilty.—At Mayo eleven persons were indicted for administering an unlawful oath to Francis M'Hugh, on the 4th December last. Bills of indictment against the traversers had been sent before the Grand Jury for "a conspiracy" to burn the Achil

colony, and the house of the Rev. Edward Nangle. The Grand Jury ignored the bills, but, somewhat strangely, upon the evidence of the same party, whom they disbelieved in that case, found true bills against the tra-versers for administering an unlawful oath. After a long deliberation, the Jury announced that they had not agreed, seven jurors being for an acquittal, and one for a contrary verdict. They were ordered back to the Jury-room, and not having agreed at the rising of the Court, were discharged by consent. The Jury consisted of five Protestants and seven Catholics.—At Limerick, Edw. Conway, Patrick Lynch, and John Lynch, were indicted for the murder of the Rev. Mr. Dawson, the two former prisoners having been twice tried before for the same offence. The murder was perpetrated nine years since. The trial lasted two days, and the Jury returned a verdict of Guilty against Thomas Conway and Patrick Lynch, and acquitted John Lynch. The last-named prisoner was then discharged, and sentence of death was passed on the two others.—Robert Houlihan and Patrick Nowlan were also found guilty at these assizes of the murder of Mr. Shine, and sentenced to death; but they have since received a reprieve, and are to be transported for life.

SCOTLAND.

Edinburgh.—The trial of James Bryce for the murder of Mr. Geddes, in December last, the particulars of which appeared in this Paper at the time, has terminated in a verdict of guilty, and the Lord Justice has sentenced him to be executed on the 3rd April.—It has been rumoured for some days past that Mrs. Gilmour, whose trial before the High Court here lately created so much interest, had been again apprehended on a new charge of a similar nature. It is believed to be entirely unfounded, as the Glasgow papers do not mention it.—The Bank of Scotland, the Royal Bank, the British Linen Company, the Commercial Bank, and the Union Bank, have contributed 200*l.* to the Scott monument, in addition to their former subscription, in token of their admiration of the honourable feelings which induced Sir Walter Scott, after his embarrassments in 1826, to dedicate his talents during the remainder of his life to ensure full payment of his debts.

Glasgow.—The severest snow storm experienced in Scotland this winter occurred last week, and spread over a great extent of country. After the storm subsided, an intense frost set in. All the mails were stopped for many hours beyond their usual time.

Aberdeen.—Preparations were commenced on Wednesday last for erecting in Castle-street the statue of the Duke of Gordon. An immense block of Peterhead granite, from the Stirlinghill quarries, weighing 10 tons, was brought to the intended site on the above day, and workmen are now busily employed upon it. This block forms the pedestal upon which the figure will stand.

Theatricals.

THE ITALIAN OPERA.—The opera season commenced on Saturday the 15th, with every promise of success. The opera chosen was Donizetti's *Adelia*, the same which was selected for the opening of last year's campaign, and introduced as usual merely as a substitute for something better after Easter. Madame Persiani made her appearance on this occasion with a new tenor called Corelli, who promises to take a good place among second-class singers. The ballet of *La Esmeralda* was the attraction of the evening, and was admirably sustained by M. Perrot, Mademoiselle Carlotta Grisi, and a new dancer, Mademoiselle Adelaide Frasi, who was very favourably received. On Saturday last Herold's *Zampa* was performed to introduce a new singer, S. Felice. The opera was well received, but unfortunately S. Felice was suffering from indisposition and loss of voice, which rendered it impossible to form any opinion of his powers.

Miscellaneous.

London.—So vast is the population and magnitude of the metropolis that if the population of Exeter, Plymouth, Dartmouth, Taunton, Bridgewater, Liverpool, Manchester, Birmingham, Leeds, Nottingham, Bristol, Newcastle, Brighton, Bath, Leicester, Cambridge, Chester, Halifax, Derby, Huddersfield, Norwich, Northampton, York, Lancaster, Worcester, Ramsgate, Scarborough, Leamington, Newark, Mansfield, Whitby, Kidderminster, Sheffield, Tunbridge, Shrewsbury, Lincoln, Warwick, Dover, Boston, Winchester, Salisbury, Colchester, Yarmouth, Durham, Gloucester, Ipswich, Stafford, Hereford, Rochester, Doncaster, Carlisle, Canterbury, Wakefield, Hertford, Bedford, Chesterfield, Darlington, Cirencester, Devizes, Beverley, Bury St. Edmund's, Grantham, Gainsborough, Peterborough, Huntingdon, Shaftesbury, Ely, Stamford, and Lichfield, making altogether 69 of the principal cities and towns of England, were added together, they would not make another London; for these 69 towns make 1,873,189, whilst the metropolis alone is 1,873,676, leaving an overplus of 487 in favour of London. It would require above 60 cities as large as Exeter to make another metropolis. So rapid is the growth of this queen of cities, that a population equal to that of Exeter is added to its number every nine months; but so overwhelmingly large is this Leviathan of towns, that this constant and progressive increase is scarcely perceived.—*Cornwall Gazette.*

Automaton Calculator.—An ingenious piece of mechanism has been invented by Mr. Wertheimer, for the purpose of facilitating arithmetical calculations, which are effected by it without any mental effort whatever. The apparatus, which is about 15 inches long, and two inches and a half wide, is capable of adding up any amount short of one million. On a metal plate, forming the top of the apparatus, there are nine semicircular slits, through which there are seen radii projecting from the circumference of wheels concealed beneath. On the hidden wheels are placed figures from 0 to 9, but they are only visible singly and in succession, through small apertures as the wheels turn round. Corresponding figures from 0 to 9 are engraved on the semicircular slits, between the spaces formed by the projecting radii. In operating with the apparatus, a pointer is placed in the space opposite the figure required, and the wheel is moved by it to the bottom of the slit, when the wished-for figure presents itself in the aperture. One wheel of figures tells units, another tens, and a third hundreds, and so on to hundreds of thousands. In commencing a sum the wheels must be turned so as to let ciphers appear at all the apertures. When thus arranged, if the space opposite 6 on the unit wheel be brought to the bottom, that figure will be shown; if we next bring the space opposite to 4, to the bottom, the aperture of the unit wheel will exhibit a cipher, but the 10 wheel will have turned a space, and will show the figure 1, making the sum 10. All the other wheels act in the same manner, for, whenever the cipher is shown on any one, the wheel to the left advances a space, and thus adds 10, a 100, or 1000. By proceeding in this manner and by bringing down one amount after another the figures finally exhibited represent the sum in pounds, shillings, pence, and farthings with mechanical accuracy. A curious effect is produced when addition is made to a series of figures representing the highest amounts of each place of numerals. For example, if to 99,999*l.* 19*s.* 11¾*d.* one farthing be added, every figure is changed in rapid succession as the respective ciphers are brought to the bottom, and the sum 100,000*l.* 0*s.* 0*d.* is presented almost instantaneously. After a little practice the amounts may be noted by the apparatus as rapidly as they can be written, and the resulting figures show the sum without any trouble of addition. If the figures be taken down carefully the sum must be correct, and should this calculator not prove of more extensive utility, it will be valuable as a check in banking-houses and merchants' offices.—*Times.*

Another new System of Medicine.—The *Siècle* states that Dr. Junod of Paris has invented a new method, which he terms hemospasic, for the treatment of a number of diseases. This method consists in the employment of a pneumatic apparatus of a peculiar construction, in which the arm or leg is so placed as to attract the blood to the extremities without diminishing the mass of this liquid. This apparatus, which has been for some time in use both amongst the public and in the hospitals of Paris, has obtained the approbation of the most eminent physicians in France. It gained for its author the Montyon prize, together with the congratulations and the thanks of the Council-General of the Hospitals of Paris.

American Army.—The following is the strength of the army of the United States:—716 commissioned officers, 17 military storekeepers, and 7590 enlisted men, (non-commissioned officers, artificers, musicians, and privates, of dragoons, artillery, infantry, and riflemen.) 40 sergeants, and 250 enlisted men of ordnance, making an aggregate of 8613.

American Navy.—The following is the strength of the American navy:—One ship of 120 guns, nine ships of the line of 90 guns each, one razee of 62 guns, twelve 52-gun frigates, one 50-gun frigate, two 48-gun frigates, 11 first-class sloops of war of 24 guns each, three 22-gun sloops, five 16-gun sloops, 2 sloops for store ships 6 guns each, and 4 first-class sloops on the stocks, nearly ready for launching; eleven 10-gun brigs and schooners, 3 ditto used as store ships, and one for a receiving vessel at Charleston. The steam-ship Mississippi of 12 guns, the Fulton of 8 guns, the Princeton (Ericson's propeller) of 12 guns, the Union of 4 guns (with Hunter's submerged wheels), the Poinsett of 2 guns, and an iron steamer, the Michigan, nearly ready to launch on Lake Erie. There are likewise four small schooners employed as packets or receiving vessels. In all 76 vessels.

Number of English in France in 1844.—The following is an official return made by the municipal authorities to the Minister of the Interior and Prefet de Police in Paris of the number of English residents throughout France on the 1st January, 1844:—Paris, 25,000; St. Cloud, Versailles, and St. Germain-en-Laye, 6000; Rouen, Havre-de-Grace, and Dieppe, 5000; Harfleur, Honfleur, and Caen, 2300; Fontainebleau, Orleans, and Tours, 3500; Bordeaux, Toulouse, Po, Barreges, Montpellier, Nismes, and Marseilles, 3500; Aix, Avignon, and Lyons, 600; St. Quintin and Lille, 1500; Amiens, Beauvais, Arras, Abbeville, and Montreuil-sur-Mer, 2800; Boulogne-sur-Mer and vicinity, 7000; St. Omer, 2700; Cassel, Warmhout, and Armentiéres, 300; Bergues and Dunkirk, 2000; Guines, Marquise, St. Pierre, and Calais, 4800; making a total of upwards of 66,000 English residents in France. Admitting that each on an average expends five francs a day, the annual sum spent by the English will be above 4,820,000*l.* sterling. This return does not include the number of English who pass through France on their route to Switzerland, Germany, Italy, the Mediterranean, and India, which on an average exceeds 50,000. The facility now afforded by the London, Folkestone, and Dover Railway, and steam-packets to passengers for Boulogne and Calais, from Southampton to Havre, and Brighton to Dieppe, has greatly increased the number of visitors, which this summer will, in all probability, be from 60,000 to 80,000.

Law.

ASSIZE INTELLIGENCE.—NORTHERN CIRCUIT, YORK.—*Thomas Walker* was indicted for forging and uttering, knowing the same to be forged, a certain interim order in bankruptcy for the protection of the person and goods of an insolvent debtor from arrest and execution. Defendant had been in the habit of practising in the District Court of Bankruptcy at Leeds, and having undertaken the case of an insolvent debtor there, he gave to the debtor an interim order, purporting to be signed by Mr. Bere, one of the commissioners of that court, as a protection to the insolvent and his goods against arrest and execution by any of the creditors. To this order defendant had forged the name of Mr. Bere. His counsel stated that they could not resist the evidence, and a plea of Guilty was put in. It was urged in mitigation of punishment that defendant had committed the act while in a state of intoxication and in consequence of the generosity of his disposition. Baron Rolfe said he could not understand how a person could put forth as an excuse for a forgery that he was drunk when he did it. Some witnesses were then called to his character, and the defendant was then directed to stand down, the learned Judge saying he would make inquiries, and consider what sentence he should pass.—*George Lowther* and *Matthew Pearson*, two poachers, were indicted for the wilful murder of John Moffit, Lord Normanby's gamekeeper, by shooting him with a gun. The particulars of this case have already appeared in this Paper. After a long trial the Jury returned a verdict, finding Lowther Guilty and Pearson Not Guilty. The Judge, in passing sentence of death upon the former, said that he had been convicted on the clearest testimony, of depriving a fellow creature of life, and that he could not hold out to him the slightest hope of a relaxation of the law in his case. Pearson was then called upon and admonished by the Judge, who trusted that the unhappy end to which his companion would soon come would operate as a warning to him, and would be the means of inducing him to abstain from following the unlawful practice which had led to this investigation.

HOME CIRCUIT, MAIDSTONE.—*George Kelly*, described as a railway sub-contractor, *William Brown* and *George Collins*, labourers, were indicted for burglary in the dwelling-house of Mr. John Jennings, farmer, at Frittenden, and stealing a watch, 17*l.* in money, and some articles of wearing apparel. The offence was fully proved against Kelly and Collins, but Brown was Acquitted. The three prisoners were then arraigned for a robbery in a dwelling-house of a farmer named Monk, and stealing Bank-notes and gold to the amount of 140*l.* The prosecutor in this case lives at Norton, near Sittingbourne, and the robbery was committed on the 11th November. The evidence was conclusive, and the Jury found Kelly and Brown Guilty, and Acquitted Collins. The Judge, addressing the prisoners, said they had been convicted of a very serious offence, and there could be no doubt that they were most desperate characters. With regard to Kelly, who had been convicted upon two indictments, and who appeared to have been the leader of the party, the sentence was, that he be transported for life, and the others for fifteen years. LEWES.—*John Lawrence*, the young man whose apprehension for the murder of Mr. Solomon, the chief constable at Brighton, we noticed in our last, was tried on Thursday at these assizes. Our readers will recollect that he struck the chief constable on the head with a poker and felled him to the ground, and that Solomons died in consequence on the next day. The Jury found him guilty, and Lord Denman passed sentence of death, holding out no hope of mercy.

NORFOLK CIRCUIT, BEDFORD.—*Thomas Elmer* was indicted for setting fire to a stack of barley, the property of Mr. William Eames, farmer, at Hawnes; and *Thomas Clarke* was indicted for setting fire to the barns and stacks of Mr. Geo. Garratt, at Billington, on the 17th November last. They were both found Guilty, and sentenced to transportation for life.

OXFORD CIRCUIT, STAFFORD.—*Edward Butler* was indicted for the wilful murder of his wife, at Tipton, in this county. His guilt was fully proved, but the Jury returned a verdict of Guilty of Manslaughter only, and the Judge sentenced him to transportation for life.

WELCH CIRCUIT, HAVERFORDWEST.—(Rebecca Trials.)—*William Walters* and *David Vaughan* were put to the bar, charged with a riot and unlawful assembly at Prendergast turnpike-gate, on the night of the 25th August last. The prisoners were found Guilty of being at this unlawful assembly, and were sentenced to twelve months' imprisonment each. There were twenty-six cases on the calendar, of persons who were concerned in the riotous proceedings at Fishguard, in September last, but they were held to bail, the Crown proceeding no further in them. *John Harries* and others were found guilty of a riot at Pallog, in the parish of Abernant; and *Jonathan Jones* and others were found guilty of riotously assembling at the same place. Sentence in both cases was deferred.

BIRTHS.—On the 14th inst., at Castlebar, county of Mayo, the lady of A. MAGNAY, Esq., her Majesty's 69th Reg., of a son—16th inst., at Clifton grove, York, the wife of Capt. DARNELL, of a daughter—16th inst., at Laurel villa, Hammersmith, the wife of A. REBOUL, Esq., of a daughter—16th inst., at Brighton, the lady of R. T. GOODWIN, Esq., 16th Reg. Bombay Native Infantry, of a daughter—17th inst., in Upper Harley-street, the lady of L. POLE, Esq., of a daughter—18th inst., at 23, Montagu-street, Russell-square, the wife of J. SHAW, Esq., of a son.

MARRIED.—On the 3d Jan., at the Barrack Protestant church, Berhampore, F. A. KILLWICK, son of the late J. A. Killwick, Esq., of Southwold, to SOPHIA GRAY, third daughter of W. M. Gray, Esq., Nauthpore, Bengal, India—27th ult., at the Palace-chapel, Malta, Commander E. OMMANNEY, R.N., of her Majesty's ship Vesuvius, son of the late Sir Francis M. Ommanney, to AMELIA MARY SMITH, eldest daughter of S. Smith, Esq., of H.M.'s Dockyard, Malta—11th inst., at St. George's, Hanover-sq., H. E. BUTLER, only son of the late Hon. H. Butler, and nephew and heir of the Right Hon. the Earl of Kilkenny, to FRANCES PENELOPE RAWSON, only child of T. Rawson, Esq., of Nidd-hall, Yorkshire—15th inst., at St. Brelade's Church, Jersey, Jos. DESLANDES, jun., Esq., his Swedish and Norwegian Majesty's Consul for that Island, to SARAH ANN WINTER, eldest daughter of G. Winter, Esq., of Baddagamma, Ceylon.

DEATHS.—On the 29th Feb., at Naples, FANNY ACLAND, the beloved wife of Sir P. P. F. P. Acland, Bt., of Fairfield, county of Somerset—Lately, after a short illness, at Leicester-house, Jersey, R. C. SIDNEY, Esq., third son of the late John Sidney, Esq., many years of the Court-lodge, Yalding, Kent, and brother of Sir Robert Sidney—13th inst., in London, after a long and protracted illness, Major-General Sir O. CAREY, C.B., K.C.H., Commanding the Cork district, Ireland, aged 58—16th inst., ELIZA LONG, the beloved wife of W. Long, Esq., surgeon, Brighton—16th inst., at Sittingbourne, Kent, ELEANOR CASTLE, wife of W. Castle, Esq., aged 75—16th inst., CATHERINE SEATON, only child of Mr. E. Seaton, surgeon, 77, Sloane-street, aged 14 months—16th inst., in Oxford-street, Liverpool, MARY ANN LUNDIE, wife of Thomas Lundie, Esq., late of Jamaica—16th inst., in Curzon-street, HENRIETTA BALFOUR, relict of John Balfour, Esq., of Trenebay, and of Charlton-grove, Kent—16th inst., R. J. HARRISON, Esq., of Caerhowel, in the county of Montgomery, aged 64—16th inst., F. W. ROLFE, only son of Mrs. Rolfe, of Eldon-square, Reading, Berks—17th inst., Mr. J. GROVES, of Charlton-crescent, Islington, aged 86—17th inst., at the house of her brother, T. Attree, Esq., Queen's-park, Brighton, Mrs. ROYDE, widow of the late G. Royde, Esq., aged 61—17th inst., ELIZA NORTON, wife of R. Norton, Esq., surgeon, 21, Dorset-street, Portman-square—17th inst., at Richmond, Surrey, after a protracted and painful illness, SARAH HILLYER, youngest daughter of the late Mr. Thomas Hillyer, of the same place—17th inst., at Clapham-park, WM. WILCOX WEST, only child of W. T. West, Esq.—17th inst., JOHN WALTON, Worsley-mills, near Manchester, aged 63—17th inst., after a severe illness, GEORGIANNE PEARSE, fourth daughter of George Pearse, Esq., Marsham-st., Westminster—18th inst., in Upper Brook-street, the Honourable CHARLES CHOLMONDELEY, youngest son of the Right Hon. Lord Delamere, aged 17—19th inst., at Fulham, CHARLOTTE OWEN, relict of the late Rev. John Owen, aged 76.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks, which are ornamental in appearance, can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. MR. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

BURBIDGE AND HEALY beg respectfully to inform the Horticultural world that they are quite ready to supply their new BOILER, of every size. They have now fixed a sufficient number to warrant them in stating that what they put forth as the qualities of their Boiler and Furnace arrangement may be perfectly relied upon: they have put up one at the Horticultural Gardens, where B. and H. believe it is considered to answer as represented; they have also fixed it in connection with a new description of Iron Tank, which combines the qualities of the round pipe and the open tank, which may be pronounced the perfection of a Heating Apparatus for Horticultural purposes, particularly for Graperies, Epiphyte-houses, Melon-pits, &c., &c. The arrangement is such that any gentleman or gardener may have the whole constructed so as to be put together with the greatest facility by the gardener, first sending a correct plan to 130, Fleet-street. A Prospectus may be had detailing the prices, &c.

WIRE-WORK, HOT-WATER APPARATUS, GREEN-HOUSES, &c.

ST. THOMAS BAKER, MANOR-HOUSE, MANOR-PLACE, KING'S-ROAD, CHELSEA, Manufacturer of INVISIBLE WIRE FENCE, to resist Grazing Stock, and rendered Rabbit-proof. WIRE-WORK in Trainers, Arches for Walks, Bordering, Flower-stands, Pheasantries, &c. HORTICULTURAL BUILDINGS, Green and Hothouses, Conservatories, &c. The same heated by HOT-WATER APPARATUS, on improved and economical principles.

Parties waited on in Town or Country, and Drawings and Estimates free. Work for the Trade as usual.

Ward's Cases, or Domestic Greenhouses.

HORTICULTURAL BUILDING & HEATING by HOT WATER.

J. WEEKS & Co., ARCHITECTS, &c., Gloucester-place, King's-road, Chelsea, Hothouse-Builders and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in ten hours, and will heat a range of Forcing-houses 300 feet in length.

Their improved plan of BOTTOM-HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the Nobility and Gentlemen's Seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

THE CONICAL HOT-WATER BOILERS, invented by J. ROGERS, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical; it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pineapple-place; Messrs. Veitch & Son's, Exeter; Mr. Pontey's, Plymouth; the Royal Botanical Society's Gardens, Regent's-park; and at the Gardens of the Horticultural Society of London. Considerable improvements have been effected since last season, particulars of which are in course of preparation.

ONE-HUNDRED CUCUMBER AND MELON-BOXES and LIGHTS for Sale. One, Two, and Three-Light Boxes and Lights of all sizes ready for immediate use—best materials: packed and sent to all parts of the kingdom by JAMES WATTS, Sash Manufacturer and Hothouse Builder, Claremont-place, Old Kent-road. Garden Lights glazed and painted complete from 1s. per foot.

HENRY HUNT'S PATENT GARDEN-POTS and STANDS, for effecting improved Drainage and Draught of Air. Patronised by Royalty and 30 Metropolitan and Provincial Horticultural Societies. Wholesale and Retail Depôt, 29, Queen's-row, Pimlico. The opinions of the Horticultural and Scientific Press, with priced Cards, forwarded on application, post-paid. Nurserymen in provincial towns appointed Agents.

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the Public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the Apparatus; and B. and H. can safely recommend it from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices, to 130, Fleet-street.

BERLIN WOOLS, PATTERNS, &c., at greatly reduced prices, at WILKS'S Warehouse, 186, Regent-street.—A superb Assortment of WOOLS of all kinds, in every Size and Colour, Plain, Chiné, and Shaded, for Knitting, Netting, Crochet, and Embroidering. All these Wools, including the Imperial Eight-thread, or Double Berlin Wools, for Crochet and Knitting, have been spun expressly for this House, and are remarkable for their quality.—WILKS'S Warehouse, 186, Regent-street.

HORIZONTAL WATCHES, very Flat.—A. B. SAVORY and SONS, Watchmakers, 9, Cornhill, London, opposite the Bank. Price, in silver cases, three and a half guineas each; or in gold cases, six guineas each. These Watches are accurate and durable, the horizontal escapement being peculiarly suited to combine those important requisites. They are jewelled in four holes, and continue going whilst being wound. A twelvemonth's warranty given with each.

MECHI'S suburb TEA TRAYS, in Papier Maché, (Manufactory, 4, Leadenhall-street,) London, are unrivalled specimens of japan work, infinitely surpassing the Chinese. The prices vary from a very low figure up to twenty guineas the set. They comprise some brilliant specimens of art, in figures, landscapes, flowers, and birds, with buhl and gold. The same manufacture is applied in work-boxes, dressing-cases, envelope-cases, netting-boxes, glove-boxes, playing-card-boxes, and ladies' visiting-card-cases, hand-screens, pole-screens, card-racks, inkstands, ladies' work-tables, chess-tables, portfolios, note and cake-baskets, ladies' desks, letter-boxes, &c. The foregoing are all in papier maché, and very cheap, say from 13*s.* up to 20*l.*; and Mechi can confidently assert that his establishment for these articles surpasses in price, quality, and extent of stock any similar concern in the United Kingdom. Mechi is sole inventor of the Mechian dressing-cases, the patent castellated tooth-brushes, 9*d.* each, the cushioned bagatelle-tables, the magic razor-strop, and peculiar steel razor. A visit to his establishment will gratify those who are desirous of seeing the most perfect manufactures of this country displayed in the most attractive form.

BERDOE'S SUPERIOR REALLY WATER-PROOF FROCKS, for the present season. An extensive variety of the above, in NEW and greatly improved materials (in lieu of the unsightly rubbish made by slopsellers), now ready, guaranteed to exclude any rain whatever; and confidently recommended to those who regard a respectable appearance, or wish to avoid disappointment and vexation. FIRST-RATE CLOTHING of every description upon the lowest terms possible, consistent with TRUE economy, and ultimate satisfaction. W. BERDOE, Tailor, Waterproofer, &c., 69, Cornhill, (North side.)

HORTICULTURAL IMPROVEMENT.—As spring approaches, the larvæ of destructive insects are propagated in infinite multitudes and with amazing rapidity, to the great injury of the young shoots of Trees, Vines, Plants, and indeed every species of vegetation put into motion and growth by the genial influence of the season. These animalculæ make the greatest havoc in forcing-houses, wall-trees, hot frames, &c. &c. as they can endure any degree of heat, but speedily perish from moisture. By the use of READ'S NEW PATENT HYDRAULIC MACHINE these insects may be easily destroyed, and plants of the most delicate description preserved in a healthy and thriving state. This machine, with many others entirely new, may be seen and proved at the Patentee's, 35, Regent Circus, Piccadilly. None are genuine except stamped with the Patentee's name.

THE HAIR.—Of the numerous compounds constantly announced for promoting the growth, or reproduction of the Hair, few survive, even in name, beyond a very limited period; whilst ROWLAND'S MACASSAR OIL, with a reputation unparalleled, is still on the increase in public estimation. The singular virtues of this successful invention for *restoring*, *preserving*, and *beautifying* the *Human Hair*, are too well known and appreciated to need comment. The very facts of the high and distinguished patronage it enjoys, its general use in all countries, together with numerous testimonials constantly received in its favour, are authorities which stamp its superior excellence and title over all attempts of a similar nature. Being universally preferred, its consequent great demand excites the cupidity of unprincipled Shopkeepers, who vend the most spurious trash as the "GENUINE" *Macassar Oil;* whereas the genuine article is wholly the invention and property of A. ROWLAND and SON, and the amalgamation of its *costly exotic* materials renders abortive any attempt to discover its component parts—thus proving the imposition of all other articles bearing the title of "*Macassar Oil.*" The genuine article has the words ROWLAND'S MACASSAR OIL on the wrapper.—All others are FRAUDULENT COUNTERFEITS!!!

WANTED by a Lady, in the neighbourhood of Tunbridge-Wells, a Man and his Wife, as GARDENER and COOK. The former must be an active, industrious, and good Kitchen Gardener; he must understand the management of a small Greenhouse, be able to propagate, as well as cultivate common Greenhouse and Garden Flowers, and to take the entire charge of a small place containing an Orchard, which, with the Flower and Kitchen Garden, must be kept in the neatest order. He will also be required occasionally to drive a single horse carriage, and will have the help of a boy for part of every day. The Wife must be a nice Plain Cook, and understand making Pastry and Preserves. She will be required to assist in a monthly wash, and to take a small part of a small house, in which her work will be easy; but the utmost cleanliness and punctuality will be indispensable. To a married couple who can value the comforts of a well ordered family, and kind treatment, the above will be found a very desirable situation; but in order to save useless trouble to both parties, it is very particularly requested that none will answer this advertisement, whose character will not bear the strictest inquiry for integrity, sobriety, &c, as well as ability to perform all that is herein stated. Post-paid letters to be addressed to A. B., Post-Office, Wimbledon.

WANTED IMMEDIATELY, in the Great Yarmouth Nursery, a steady, sober, active Man, who is capable of assisting in the Carnation and Picotee department; can write a good hand, and can also be trusted in the Greenhouse department occasionally. Apply, with terms and reference as to capability, to YOUELL and Co., Great Yarmouth Nursery.—March 14.

WANTED, by a Gardener, A GARDEN from 2 to 3 acres, inclosed, within 7 miles of Covent-garden; if a dwelling-house and hot-house are attached it would be preferred. To be taken on a Lease at a moderate rent.—Direct, post-paid, to A. B., 17, Danvers-street, Chelsea.

WANTED, near London, a GARDENER, who thoroughly understands the Kitchen and Flower Garden; and who would take charge of, and milk a Cow. Wages, One Guinea a week.—Direct to A. at Mr. Ordway's, 159, Piccadilly.

WANTED, immediately in a large Provincial Nursery, two Active Industrious men, that well understand budding, grafting, layering, and all out-of-door Nursery work in general. For particulars apply to Messrs. E. & J. NIXON, 123, Great Portland Street, London. Single men would be preferred.

WANT PLACES.—All Letters to be post-paid.

AS FOREMAN.—A respectable young Man, who has served in the capacity of Foreman, where Forcing Pines, Grapes, &c., with Framing in general, are carried on upon the most improved principles, wishes a change, with a view to further improvement in plants. He will accept of a Situation without charge, if his object can be gained. Has had good practice in the use of tools, and will be found to be a general handy man. Character good; distance no object.—Direct to A. Z., Mr. Rogers, Confectioner, Streatham.

AS HEAD-GARDENER.—A respectable middle-aged Man, who can give satisfactory reasons for leaving his situation, and whose present employer, as well as numerous gentlemen to whom he is well known as a very successful grower of Pines, Grapes, Orchidaceæ, &c., would be ready to give him testimonials of first-rate abilities as a general Horticulturist and Gardener.—Direct to R. P., at WHITE & Co.'s Nursery, Poole.

Poole, March 22, 1844.

AS GARDENER.—A middle-aged single Man, with an unexceptionable character of 6 years; can produce satisfactory references for the last 20 years, if required, from families of the highest respectability; he is practically conversant with the most approved system of Horticulture and general routine of Gardening in all its branches, having had great experience in Forcing Fruits and Flowers of every description.—Direct to E. POWELL, at Mr. G. Clarke's, Shirley-park, near Croydon, Surrey.

AS GARDENER.—An industrious middle-aged Man, who is competent to the entire management where every department of the science is in practice. The advertiser was born and bred a Gardener, and has paid particular attention during his lifetime to the culture of the Grape Vine. He will undertake to produce a first-rate crop of Grapes in sixteen months after the Vine is planted. He is desirous of rendering himself serviceable to any Nobleman or Gentleman who might be pleased to engage him, and whose Vinery and Gardens may have been neglected. He also wishes to state that in the event of his meeting with employment, and failing to surpass any other Gardener in Grape Growing *that he will not expect to receive any wages.* He can be recommended by one of the first Grape growers in the kingdom, and have a seven years' character from his present employer. Wages, 50*l.* per annum.—Direct to O. P. Q., Post-office, Brandon, Suffolk.

AS GARDENER.—A Married Man from the country, with two children, who thoroughly understands his profession, both in the Kitchen and Flower Garden, early forcing of Fruit, Cucumbers, Melons, and Mushrooms. A single-handed place will not be objected to; is willing to make himself generally useful upon reasonable terms; can have two years' and a half good character from the situation he has just left. Direct, G. K., at Mr. LAWRENCE'S, No. 18, Piccadilly.

AS GARDENER.—JAMES ROBERTS (Author of a "Comprehensive View of the Culture of the Vine under Glass"), Gardener to Matthew Wilson, Esq., Eshton-hall, Skipton, Yorkshire, is desirous of changing his situation, having been engaged by his venerable and esteemed employer (with whom he has been ten years), in designing and completing extensive new Kitchen and Forcing departments, Pleasure Grounds, Flower Gardens, &c., &c., which are in the highest state of cultivation. As such he begs to refer to the reports of the London Horticultural Society—to their awards of Medals. Would be glad to engage with any Nobleman or Gentleman contemplating extensive improvements, or requiring a Gardener in the highest departments of his profession, more especially in the culture of Exotic Fruits. He will be at liberty on the 16th of May next; can produce the highest testimonials; is married, and aged 40.—Letters addressed as above shall have his best attention.

AS GARDENER, a single Man from the country, age 27, who has a general knowledge of his business in all its branches, and can be well recommended by the Gentleman whom he lived with five years.—Direct to T. W. B., Mr. CURRIE'S, No. 2, Princes-st., Cavendish-square, London.

AS GARDENER, a Single Man, aged 27, who thoroughly understands his business in all its branches, has had considerable experience in the forcing of fruits, flowers, &c.; has lived with Mr. Macintosh, late Gardener to the King of the Belgians, Claremont, now Gardener to the Duke of Buccleuch, Dalkeith Palace, Scotland, nearly two years; with Mr. Toward, Gardener to her Royal Highness, the Duchess of Gloucester, Bagshot Park, three and a half years, and for the last three years with Mr. D. Beaton, Gardener to Sir William Middleton, Bart., Shrubland Park, Ipswich. He is practically acquainted with the system of forcing plants and flowers for the Conservatory and Drawing-room, adopted by the last named eminent cultivator at Shrubland Park. Testimonials of ability will be given by the above parties, or letters addressed to A. T., at Messrs. Henderson, Nurserymen, Pine-Apple Place, Edgeware Road, London, will be respectfully attended to.

AS GARDENER, a Young Man, aged 27, who has a thorough knowledge of the business in all its branches, whose character will bear the strictest investigation.—Apply to Mr. William Barnes, Gardener to G. K. Norman, Esq., Bromley Common, Kent.

AS UNDER-GARDENER.—A respectable young Man, aged 25, who wishes a little instruction in plants. Five pounds will be given; and he can be well recommended.—Direct to Y. Z., Post-office, Hackney.

TO LANDED PROPRIETORS AND AGRICULTURISTS.

AS LAND STEWARD.—A person, 30 years of age, who has been constantly engaged as a Land Agent, and is thoroughly conversant in all matters connected with the management and improvement of Estates, Draining, Planting, Road-making, Building, Repairs, Letting Farms, Valuations, Tithe Commutation, and also with the most approved systems of Norfolk and Suffolk Farming, Grazing, &c., wishes to obtain a situation as Land Steward to a Nobleman or Gentleman. He can give the most unexceptionable references from Gentlemen to whom he has been known from his infancy.—Direct to C. D., Post Office, Bury St. Edmunds.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

A Stamped Newspaper of Rural Economy and General News.—The Horticultural Part Edited by Professor Lindley.

No. 13.—1844. SATURDAY, MARCH 30. [Price 6*d*.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—SOUTHAMPTON MEETING.—Prize-Sheets and Regulations for the Exhibition of Stock, Implements, &c., together with the blank Printed Forms of Certificate required to be filled up by Exhibitors, and copies of the printed Programme of the Meeting, may be had on application, either personally or by letter, addressed to the Secretary, No. 12, Hanover-square, London.

Exhibitors are particularly requested to observe, that all Certificates for Implements, &c., must be sent, complete, so as to reach the Secretary on or before the FIRST OF MAY; and all Certificates for Stock on or before the First of June.

By order of the Council, James Hudson, Secretary.

London, March, 1844.

CHOICE PANSIES.

J. HENCHMAN begs to inform cultivators of the PANSY that he is now sending out healthy plants of six good seedling varieties, for 21*s*. the set. Also a few choice kinds at 18*s*. and 18*s*. per dozen.—Edmonton, March 1844.

NEW HARDY ANNUAL.

VISCARIA OCULATA—DARK-EYED VISCARIA.

T. AND J. BACKHOUSE, Nursery and Seedsmen, York, have the pleasure of offering to the Public the above new and beautiful Annual, which is figured at page 53, (No. 10), of the "Botanical Register" for 1843. The blossoms are of a bright rose-colour, with a deep crimson eye, and changing to a pale purple. It flowers very abundantly through the greater part of the summer and autumn. It is a native of Algiers, and may be sown either in the open ground in spring, or raised on pots and planted out.

Packets, 2*s*. 6*d*. each, will be sent, on the receipt of a Post-office order, postage free, to any part of the Kingdom.

WOODLANDS NURSERY, MARESFIELD, near Uckfield, Sussex.

WILLIAM WOOD AND SON have much pleasure in acquainting their numerous Patrons and Friends that they have been appointed Agents for the sale of that most invaluable article—WHITNEY'S CHEMICAL TRANSPARENT WATERPROOF COMPOSITION, samples of which may be seen, and the composition in use, at Wood and Son's Nursery. Sold in bottles, with ample directions for use, pints 2*s*. 6*d*., quarts 4*s*. 6*d*. each. Discount to the Trade.

SEEDLING FUCHSIA, CACTUS, and PANSY, HOLLYHOCK SEED, &c.—LYNCOMBE VALE NURSERY, BATH.

J. KITLEY begs to inform the Nobility, Gentry, and the Public that he has purchased of Mr. Pond his unequalled SEEDLING FUCHSIA (PONDII), allowed by all who have seen it to be one of the largest and handsomest Fuchsias of the day; tube and sepals bright crimson, with darker corolla, and extremely free bloomer; fine compact habit; cannot fail to give satisfaction. 5*s*. per plant.

J. K. has a few more plants of fine SEEDLING CACTUS (SPECIOSA SUPERBA), 10*s*. 6*d*. per plant. Also, good healthy plants of his SEEDLING PANSY (LYNCOMBE VALE RIVAL). This Flower, both for shape and decision of colour, is decidedly the best light PANSY out. 3*s*. 6*d*. per plant.

J. K. can recommend his HOLLYHOCK SEED, with the greatest confidence, having taken great care to select from his best full and very double Flowers of 1843 20 distinct varieties, named to colour, which he will forward to any purchaser post-free, on the receipt of a Post-office order for 5*s*. The whole of the above are now ready to send out.—Bath, March 29, 1844.

WOODLANDS NURSERY, MARESFIELD, near Uckfield, Sussex.

NEW and SUPERB FUCHSIAS, VERBENAS, PETUNIAS, CINERARIAS, CAMELLIAS, GREEN-HOUSE and HERBACEOUS PLANTS, HARDY CLIMBERS, and Plants adapted for bedding.

Wm. Wood & Son beg to inform their Friends and Amateurs that a Catalogue of the above, together with a List of entirely new ROSES, is now ready, and may be had Gratis on application.

NEW FUCHSIAS.

JOHN SMITH, Nurseryman, Dalston, begs to announce that he intends sending out, in May next, the following fine and showy Fuchsias, in strong plants, at the prices named, viz. Albion, 5*s*.; Coronet, 7*s*. 6*d*.; Coccinea pera, 5*s*.; Decora, 7*s*. 6*d*.; Expanse, 7*s*. 6*d*.; Gigantea, 10*s*. 6*d*.; Hector, 5*s*.; Incarnata, 5*s*.; Modesta, 5*s*.; Neptune, 5*s*.; Reflexa, 5*s*.; Vesta, 10*s*. 6*d*.

A Descriptive List may be had on application at the Nursery, Dalston, Middlesex. The price of the Collection, 3*l*. 10*s*. Mar. 29.

AMERICAN FOREST-SEEDS.

MESSRS. EDMUND PHILLIPS AND Co., 8, London-street, Fenchurch-street, beg to inform Seed and Nurserymen that they have a consignment of all the usual varieties of the above, which they are offering at very reduced prices, with a view to effect speedy sales. They can warrant them to be fresh and genuine, all of them having been collected this last fall by a gentleman who has been long accustomed to supply the Trade.

SEEDLING FUCHSIAS.

W. PAWLEY, of the White Hart Hotel, Bromley, Kent, begs to inform the Nobility and Gentry that he has purchased the entire Stock of three splendid Fuchsias, which he intends sending out in April next, at 10*s*. 6*d*. per plant. They are considered by competent and practical men to be the best known, and twice the size of any yet in cultivation.

Queen.—A large Flower, a very free bloomer, and of good habits. Colour, a delicate light Pink, and a beautiful Rosy Vermilion Corolla.

Prince of Wales.—A very large bold Flower, and good substance. Colour, a bright Crimson, with an extraordinary large Violet Corolla. Magnet is also a large long Flower, good substance, habit, and a free bloomer.

To prevent disappointment, which is too often the case with new Flowers, the public are requested to come and see them before purchasing. Early orders are solicited, as the stock is limited, having broke very sparingly. A specimen of each will be open to any three Seedlings of 1843, grown from young plants, for the sum of 5*l*. To be exhibited at the West Kent Exhibition, held at Blackheath, in June next. N.B.—If accepted, notice to be given this month.—Bromley, March 29, 1844.

DAHLIAS.

J. KEYNES, Florist, Salisbury.—"Standard of Perfection," (Keynes').—The finest self-coloured Dahlia in the world! gained the first class prizes at Stonehenge, Windsor, Kingston, Surrey Zoological Gardens, and Crown and Anchor, Stockwell; also the first prize specimens at Stonehenge Floricultural Society, Stockwell. "It is as round as any Dahlia in cultivation; as complete an unbroken circle as could be drawn with the compasses; and as globular in front as possible. It is symmetrical to a hair, and as double as a Ranunculus. It is so remarkable as to be instantly recognised among a thousand. Colour, deep crimson. It is the flower of the season, and must be had."—*Gardeners' Gazette*, Oct. 14. "The best-grown flower we ever saw, without exception, every requisite to meet the taste of a connoisseur being complied with; good colour, a honeycomb, regularity of growth and disposition in the leaves, and above all, as complete a rotundity of shape as if it had been cast in a mould."—*Salisbury Herald*, Sept. 2, 1843. Plants in May, 1844, 10*s*. 6*d*. "Orange Superb" (Dodd's), first-rate show-flower, 10*s*. 6*d*. "The specimen sent would grace any stand."—Glenny. "Emma Noke" (Dowding's), bluish white, extra fine, indispensable to a first-rate stand, 10*s*. 6*d*. Catalogues containing all the fine old varieties and new flowers for the season may be had on application.—Salisbury, March 29, 1844.

FASTOLFF RASPBERRY.

J. T. WILLMER begs to announce to his Friends and the Public generally that he is able to supply a few hundreds of the above-named Raspberry, in strong Canes, at 40*s*. per 100, warranted to be the genuine kind, packing included, with carriage paid to London; or in less quantity, price in proportion. Fine showing sort of CARNATIONS and PICOTEES, in 12 kinds, one pair of each, 24*s*. AURICULA.—Strong Plants of showing sorts, 12 plants, in 12 sorts, including basket and packing, the selection left to J. T. W., who possesses a large healthy stock.—Sunbury Nursery, Middlesex, March 21, 1844.

NEW PETUNIAS AND VERBENAS.

J. PEARSON, Nurseryman, Hampstead-road, London, respectfully begs to inform the Cultivators of PETUNIAS and VERBENAS that the following SEEDLINGS will be found well worth their notice. The Petunias were exhibited at the Royal Botanic Gardens, Regent's Park, in July last, and were much admired for their fine rich colour and size of flower; they were also noticed in the *Chronicle* by Professor Lindley. The Verbenas flowered too late for Exhibition; they will prove equal to the description given of them; they were much approved of (and orders given) by all that have seen them in flower. Plants will be sent out the first week in April. A remittance requested from unknown correspondents.

PETUNIAS.

NE PLUS ULTRA.—Colour deep rose, large and stiff flower, habit robust. 3*s*. 6*d*.

SPECIOSISSIMA.—Fine bright crimson, large and abundant bloomer. This is an excellent variety. 3*s*. 6*d*.

FORMOSA.—Rosy lilac, with fine dark centre, flower large, habit compact. This is quite a distinct variety. 3*s*. 6*d*.

CELESTIAL.—White, with dark centre, flowers large; the same habit as P. Beauty. 3*s*. 6*d*.

SPLENDIDA.—Very rich, dark crimson; large round flower; habit excellent. 3*s*. 6*d*.

VERBENAS.

TEUCRIOIDES ATRO-SANGUINEA.—Fine blood-red, long spike of flower with white eye, foliage fine dark green; decidedly the best Verbena ever offered to the public either as a pot plant or for bedding out. 5*s*.

TEUCRIOIDES CŒLESTINA.—Rich purple, changing to a beautiful sky-blue; habit strong, with a spike of flower in the true character of the old Verbena teucrioides. 3*s*. 6*d*.

TEUCRIOIDES PRINCESS ALICE.—Delicate rose, flowers large and very fragrant. 3*s*. 6*d*.

SPECIOSISSIMA.—Rosy vermilion, with white eye; flowers large, a good trusser. This is a showy and distinct variety. 3*s*. 6*d*.

BEAUTY SUPREME.—Rosy lilac, habit strong, the flowers large and fine, very clear and constant in colour; an excellent variety. 3*s*. 6*d*.

FLORIST TO HER  MAJESTY THE QUEEN.

PETUNIA PUNCTATA.

W. MILLER refers the readers of the *Gardeners' Chronicle* to his full advertisement of this beautiful flower—just remarking that its *Strong, Dwarf habit*, and *Glossy Dark Green* foliage, contrasted with its lovely, large, spotted flowers of various colours (by far surpassing any Petunia yet out), renders it a desirable object for every greenhouse, and especially to all Exhibitors. Strong plants in April, 7*s*. 6*d*.

The following Nurserymen have ordered plants, and will be enabled to supply them true:—

Messrs. Henderson and Co., Pine-apple-place, London

Flanagan and Sons, Mansion House-street
Noble and Sons, Fleet-street
Mr. Kernan, Seedsman, Great Russell-street
Mr. Corstein, St. James-street, Covent Garden

*** This List will appear again in a fortnight, when all other Nurserymen and Florists' names will be added who order plants. The time will also then be stated of the sending out of the plants.

The usual trade allowance when three or more are taken at once. A remittance or reference will be expected from unknown correspondents.

W. M. cannot supply more orders for choice Fuchsias till the latter part of April.

Any person having any Canadian Hollies, the following are wanted:—Some strong white Clematis Plants in the Seed-pots, 2 or 3 years' old, and the price per 100.

Providence Nursery, Ramsgate, March 27, 1844.

NEW CAMELLIAS, FUCHSIAS, and CINERARIA.

J. HALLY, Nurseryman and Florist, Blackheath, begs to offer for sale the following SEEDLING CAMELLIAS, which have been highly approved of by all who have seen them:

PULCHELLA ROSEA.—Figured and described in the "Florists' Journal" for July last; a finely-formed delicate rose-coloured Flower, perfect in shape, rising well up in the centre. Good Plants, each, 3*l*. 3*s*.

ALBA MULTIFLORA.—Colour very pure white, with sometimes a delicate pink stripe; petals thick, cupped, and round. The chief novelty and merit of this variety consists in the abundance with which it blossoms, the flowers appearing at every joint throughout the young wood, so as when in bloom to give the plant the appearance of bearing racemes of flowers. Strong plants, 1*l*. 11*s*. 6*d*.

J. Hally can confidently recommend the following Six SEEDLING FUCHSIAS, which he intends sending out early in April; they are all very distinct and beautiful varieties.

1. SANGUINIVEA.—Tube and sepals clear delicate white, with crimson corolla; of excellent close habit. This very distinct variety gained the seedling prize at the West Kent Floricultural Exhibition, Sept. 6, 1843. For its character see *Gardeners' Gazette*, Sept. 9th, in the account of the said Exhibition, described as shown by Mr. Branscombe. Price 7*s*. 6*d*.

2. FAIR HELEN.—Tube and sepals white, corolla scarlet; a very neat Flower, of good habit, exhibited at the Surrey Zoological Gardens, at the September show, and universally admired. 5*s*.

3. BOYDII.—Fine thick scarlet tube and sepals, corolla large and bright crimson; of bold habit. 5*s*.

4. WAT TYLER.—Tube and sepals very large, light rose; corolla large and scarlet. A large flower, and most abundant bloomer. 5*s*.

5. KING JOHN.—Habit of plant and colour of flower like Chandlerii, but twice the strength and size. A noble variety. 5*s*.

6. MARGINATA.—Very large flower; tube and sepals scarlet, corolla (large and expanding well) crimson, having a scarlet margin round each petal. Plant of particular fine habit. 5*s*.

The above collection of Fuchsias may be had, by taking the whole, for 30*s*. The usual allowance to the trade on the above.

Also will be ready for delivery at the same time with the Fuchsias, PIPER'S "PRINCESS ROYAL" CINERARIA (not yet sent out). This beautiful variety obtained the seedling Certificate at Chiswick, and first prize at the Regent's Park last season. Price 7*s*. 6*d*. each, with the usual allowance to the trade, when four plants or more are taken.

A general Collection of Camellias, Fuchsias, Azaleas, Ericas, Cinerarias, &c. Veronica speciosa, 21*s*. each; Rosa Devoniensis, from 18*s*. per dozen.

Agents in London, Messrs. Hurst and M'Mullen, 6, Leadenhall-street.

SLOUGH NURSERY, NEAR WINDSOR,
CHOICE SELECTION OF NEW DAHLIAS, 1844.

THOMAS BROWN directs attention to his beautiful SEEDLINGS, particularly that unrivalled light flower, "LADY ST. MAUR," the superiority of which over every other of its class is too well known to need further comment. Strong and healthy plants will be ready for delivery early in May.

AURANTIA (Spary's)—Orange buff; fine form and petal. A very desirable show flower; obtained numerous prizes; 3 ft.	10s	6d
ALEXANDER (Brown's)—Maroon and crimson mottled; full and constant, centre well up, and a very useful show flower; 5 ft.	7	6
DELIGHT (Brown's,—Cream, veined and tipped with purple; petal of fine substance and high centre; very distinct to any in cultivation; 4 ft.	7	6
DESIRABLE (Brown's)—Shaded buff, quite new in colour; a good show flower; 5 ft.	7	6
LADY ST. MAUR (Brown's,—White, delicately tipped with violet purple; very deep and full, high centre, forming a beautiful outline; the petals are round, and smooth at the edge; habit of Perpetual Grand: it is decidedly the finest light flower ever offered. It attracted great admiration at Windsor, and was universally acknowledged to be the finest flower in the Exhibition; 4 to 5 ft.	10	6
NUTWITH (Brown's,—Bright crimson; a fine open-cupped petal, and a good show flower; 4 ft.	7	6
RAPHAEL Brown's)—Dark maroon, beautifully shaded with light crimson; superior petal, of excellent form: a very novel and striking variety, and will be an acquisition to any stand; 4 ft.	10	6
REMBRANDT (Brown's)—Dark purple, very round and double, rising well in the centre, and a constant show flower. It was very successfully exhibited; 3 to 4 ft.	10	6
EMMA NOKE (Dowding's)—Bush white, good general form and centre: a good useful show flower; 4 ft.	10	6
ESSEX BRIDE (Turville's,—Delicate peach lilac, of excellent petal and form; 5 ft. (*no discount*)	10	6
LADY ANTROBUS (Spary's)—White and lilac, mottled; good form, constant, and very useful show flower; 3 ft.	10	6
NONPAREIL (Proctor's,—Ruby scarlet, of first-rate properties; extra show flower; 4 ft. (*no discount*)	10	6
STANDARD OF PERFECTION (Keynes')—Crimson; of very superior form; 4 ft. (*no discount*)	10	6
SIR J. STEWART RICHARDSON (Union)—Brown ruby, great depth, and excellent show flower; 4 ft. (*no discount*)	10	6

T. B. has also Selections of fine Carnations, Picotees, and all other Florists' Flowers; Plants, Fruit-trees, Shrubs, and general Nursery Stock.

A general Catalogue of Dahlias, with a List of Superb New Pansies, to be had on application.

SPLENDID NEW SHRUBBY CALCEOLARIAS for 1844.

H. MAJOR, of Knosthorpe, near Leeds, begs to announce that he has raised 30 new varieties of Shrubby CALCEOLARIAS, which he intends to send out, for the first time, in May. They are strikingly beautiful, and of good form and size. They are selected out of upwards of 100 cut specimens which were exhibited at the Grand Annual Floricultural Show, held in the Museum Gardens, at York, Aug. 16, 1843, and had an extra prize awarded them; they also obtained an extra prize at the Leeds September Show. The following eight will be sent out together for 2*l*.:—

MIDAS.—Lemon ground, strongly marked all over the surface with red brown; good form, singularly beautiful, inch across.
FLORA.—Creamy white, densely marked on the surface with large and small spots of carmine, leaving a distinct belt round the edge, good formed flower, inch across.
APOLLO.—Lemon centre, thickly marked with large and small spots of chocolate, leaving a belt of cream round the flower, strongly marked in the throat, well-formed flower, better than an inch across.
AURORA.—Solid bletch of rich crimson brown in the centre, distinctly belted with clear yellow: round, well-formed flower, very showy, 1¼ inch across.
CYNTHIA.—Rich rosy amaranth centre, belted with light buff; fine formed flower, inch across.
MARS.—Centre mottled with two shades of red, distinctly belted with bright yellow; fine formed round flower, inch and a quarter across.
CERES.—Clean sulphur, with white shoulders; good formed bold flower, inch and an eighth across.
HERCULES.—Solid maroon centre, belted with brick red; good round well-formed flower, inch and a quarter across.

The remainder of the 30 (see Catalogue) at 3*s*. 6*d*. each.

The following approved varieties of last year may be had at 2*s*. 6*d*. each:—Purity, Enterprise, Mrs. Meynell Ingram, Knosthorpe Hero, and Bridal Ring. Other good sorts at 1*s*. each. Amateurs desirous of growing a small collection, by stating the amount they wish to expend, may depend upon having such varieties as he trusts will meet their approbation.

Mr. M. has still a few plants of his new Seedling Pansy "Princess Alice," at 5*s*. each; and he offers 24 first-rate varieties for 30*s*., post-free. For names, see List. A few packets of very select Calceolaria and Pansy-seed, 2*s*. 6*d*. per packet. A List of Select Pansies and Dahlias may be had on post-paid application. From unknown correspondents a remittance is respectfully requested.—Knosthorpe, March 26, 1844.

SHADES FOR GREENHOUSES.

J. WEEKS & Co., ARCHITECTS, Hothouse Builders, &c., Gloucester-place, Chelsea, beg to inform Horticulturists that they have made great improvements in their excellent and simple plan of Shading, whereby the largest or smallest can be instantly covered or uncovered with a sheet of canvas. To be seen in use at most of the London Nurseries, and at the Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

FASTOLFF RASPBERRY.

PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN, HIS GRACE THE DUKE OF RUTLAND, THE MOST NOBLE THE MARQUIS OF AILSA, THE EARL OF HARRINGTON, THE EARL OF LIVERPOOL, THE LORD BISHOP OF LONDON, LORD VISCOUNT LORTON, LORD SONDES, &c. &c; as well as by the HORTICULTURAL SOCIETY OF LONDON.

YOUELL AND CO. have much pleasure in announcing they are now supplying Fine Canes of the above highly-valuable and much-esteemed RASPBERRY, unequalled for the extraordinary size of its fruit and richness of flavour.

Those to whom Y. and Co. sent it last season have expressed their high admiration of its superiority over all other varieties, and has been awarded several prizes from various Horticultural Exhibitions during the season. As a proof they have not exaggerated its excellent qualities, fruit was submitted to Dr. LINDLEY, (see *Gardeners' Chronicle* of the 22d July last, page 502), whose opinion of it is as follows:—

"FASTOLFF RASPBERRY.—We have received from Messrs. YOUELL, of Great Yarmouth, fruit of the Fastolff Raspberry, and we find its merits all that has been stated in favour of its excellence. The fruit that we have received is very large, obtusely conical, and of rich flavour, far exceeding in this respect some other new and large varieties. The plants bear abundantly, and in long succession."

They also exhibited it on the 1st of August, 1843, before the London Horticultural Society, 21, Regent-street, to which a prize was awarded. It would therefore be unnecessary for YOUELL and Co. to recommend it more fully, or with greater confidence to the notice of the public, merely observing, that it continues in high perfection throughout the autumnal months, and has maintained its superiority in the most unfavourable soils and situations, and requires no other than the ordinary treatment of the old varieties.

Fine Canes are ready for delivery, and can be sent with safety to any part of the United Kingdom (on the receipt of a Post-office order), upon the following terms:—

Packages containing	100	Canes	£2 5*s* 0*d*
Do. do.	50	do.	1 5 0
Do. do.	25	do.	0 14 0

Package included.

The usual discount to the Trade where not less than 200 are ordered.

*** CAUTION.—Y. and Co. beg to call the attention of their Friends and the Public in general to the fact that they have appointed no Agents in London for the sale of the above, and cannot be held responsible for its being genuine, unless purchased direct from their Nursery.

THE NEWEST AND VERY BEST FUCHSIAS, VERBENAS, PETUNIAS, ANAGALLIS, &c.
FOR 1844.

YOUELL AND Co. beg to refer the Readers of the *Gardeners' Chronicle* to their Catalogue of the above, which appeared in this Paper of the 23d of March, and will be found to contain such varieties only as are worthy of cultivation.

YOUELL & Co. being the parties who first sent out per post, with safety, these tribes of plants, are desirous of calling attention to their advantageous method of executing orders, namely, that they will deliver them free of postage (on the receipt of a Post-office order), to any part of the United Kingdom, upon the following terms:—

12	Extra Fine varieties,	12*s*., the Selection left to Youell & Co.
12	ditto ditto	21*s*., the Selection left to the Purchaser.
50	Fine varieties	40*s*, the Selection left to Youell & Co.
50	Extra Fine ditto	60*s*., the Selection left to the Purchaser.

VERBENAS.

12	Extra fine Varieties,	6*s*., the Selection left to Youell & Co.
12	Ditto ,,	10*s*., the selection left to the purchaser.

With the exception of those marked thus. *

The plants will be strong and healthy, and ready for delivery by the latter end of March, with the exception of those marked thus * (which will be ready in April), thus ensuring the Purchaser fine plants for competition in the ensuing season. Many of the varieties can be supplied now.

CHRYSANTHEMUMS.

50 Newest and Best varieties, 12*s*. per dozen.

PANSIES.

12 Fine Show Varieties, by name, 9*s*. per dozen.
12 Extra fine do. do. 10*s*. ,,

Per post free.

FLOWER-SEEDS.—30 packets of the newest and best kinds, sent per post-free for 6*s*.

TWO NEW SEEDLING PICOTEES.—"LADY ALICE PEEL," 10*s*. 6*d*., and "MRS. BENYON," 10*s*. 6*d*. per pair.—These two splendid Picotees were raised by the Rev. J. Burroughes, of Lingwood Lodge, Norfolk, and kindly presented by that gentleman to Messrs. YOUELL & Co., for particulars of which see their Advertisement in this Paper of the 16th of Sept.

FINEST CARNATIONS AND PICOTEES.

YOUELL AND Co. beg to refer the Readers of the *Gardeners' Chronicle* to their Extensive List, with Prices, of the above highly esteemed Flowers, which appeared on the Advertising pages, 706 and 707, of this Paper, of October the 14th, and will be found to contain every variety worthy of cultivation.

Prices as follows:		£. *s*. *d*.
12 pair of good Show Sorts		1 4 0
12 ditto fine	ditto	1 10 0
25 ditto	ditto	3 0 0
12 ditto extra fine and very superior	ditto	2 10 0
25 ditto	ditto	5 0 0

The selection being left to YOUELL & Co.

ARAUCARIA IMBRICATA.

Recently planted most extensively at Her Majesty's Gardens at Windsor, and also at the Royal Gardens, Claremont, furnished by YOUELL and Co.

YOUELL AND Co., possessing the most extensive stock in the country of the above Splendid Hardy Ornamental Tree, beg to offer them on the following advantageous terms:—Fine robust 4-year old plants, 8 to 10 inches high, 10*l*. per 100, or 30*s*. per dozen.

Fine Plants of CEDRUS DEODARA, 2ft. to 2ft. 8 ins., 10*s*. 6*d*. each.

Great Yarmouth Nursery, March 28, 1844.

N.B. All Orders above £2 will be delivered carriage free either to London or Hull.

EXHIBITION of CAMELLIA JAPONICA, or Japan Rose.—A Collection of these beautiful Exotics is now in bloom at CHANDLER & SONS' Nursery, Vauxhall. Admittance gratis.

S. AND J. DILLISTONE will continue to supply Scions of their APPLE, the STURMER PIPPIN, throughout April, in packets of Six Scions, upon receipt of 3*s*. 6*d*. See Advertisement in this Paper of the 16th and 23d inst.

Nurseries, Sturmer, Halstead, Essex.

N.B.—This Advertisement will not be repeated.

CARNATIONS AND PICOTEES.

JOHN SLATER, FLORIST, Cheetham Hill, near Manchester, has on sale upwards of 1000 pairs of healthy plants of Carnations and Picotees, which he will sell at low prices. 20 pairs of Carnations and Picotees, one pair of each variety for 20*s*., package included, provided the selection is left to J. S.

CHOICE PANSIES.

J. FRYER begs to remind his Friends that he can now supply good healthy plants of most of the leading varieties of PANSIES, Catalogues of which will be forwarded on application; likewise packets of Seed from his superb collection, 1*s*., 2*s*. 6*d*., and 5*s*. each. J. F. likewise begs to say that he can supply a few more packets of his new Thunbergia Fryerii; four seeds, 2*s*. 6*d*., eight seeds, 5*s*., and all the new Fuchsias, Verbenas, Carnations, Picotees, and an extensive collection of Herbaceous Plants, all of which will be supplied at very moderate prices.

N.B. Agent for Potter's Guano and Humphreys's Compound.

Clarendon Nursery, Camberwell, London, March 29, 1844.

H. CORSTEN, 19 A, Davies-street, Berkeley-square, Florist to Her Majesty, has just imported a splendid Collection of Gladiolus Gandavensis, so greatly admired on the Continent. See *Gardeners' Chronicle*, Feb. 24, 1844, under Miscellanea. He has also for sale the Dutch Plum Gooseberries at 12*s*. per dozen; Dutch Grape Currant Trees, 6*s*. 6*d*. per dozen; large Orange and Lemon Trees, 10*s*. each. A choice Collection of Araucaria imbricata, and Pinus; also a splendid assortment of Scarlet and Red Rhododendrons: under the last named is the large Scarlet La Gloire d'Haarlem, 5*s*. each.

SEEDS.

THOMAS GIBBS & Co., corner of Half-Moon-street, Piccadilly, London, Seedsmen to the Hon. Boards of Agriculture of England and Sweden, beg to call the attention of Agriculturists to their general Stock of SEEDS, and they beg to assure their Friends that they have bestowed the greatest care and attention to the selection and saving of the various kinds. They beg to call particular attention to the following kinds, viz.: White Belgian Carrot, which produces the largest crops; Large Field Altringham Carrot, an excellent Field Carrot; Long Red Mangold Wurtzel, large produce on deep soils; Yellow Globe do. do, adapted to shallow soils; Red Globe do. do., adapted to lighter shallow soils; Purple Top Swedish Turnip, very fine small top; Green Top do. do, hardy and useful Turnip; Gibbs's Green Top Yellow Hybrid Turnip, highly approved; Red do. do., and other varieties. Mixtures of selected Natural Grass-Seeds, properly apportioned to suit the nature of various soils. From long experience and extensive practice in this particular department, T. G. and Co. confidently recommend their Mixtures to their Agricultural Friends. Mixtures of Grass-seed for Field-lawns; Do. for Grass Plots. Italian Rye-Grass, Improved Perennial Rye-Grass, and other kinds of Grass-Seed.

PERENNIAL GRASS SEEDS.

SUTTON AND SONS, having for many years paid particular attention to the collecting of NATURAL GRASSES, and having been employed by most of the Nobility and Gentry of Berkshire, Hampshire, and Oxfordshire, to mix Seeds in proper sorts and proportions to suit the soils on their Estates, both for laying down new Pastures and improving old ones, have great confidence in soliciting orders from the readers of the *Gardeners' Chronicle*, in the more northern parts of the kingdom.

SUTTON and SONS have just published a Descriptive Table of Grasses, with some information which they consider would be acceptable to their Agricultural friends, and which may be had gratis.—The cost of the Seeds is very moderate, as will be seen by a reference to the Table above referred to.

Agents for Potter's Guano.

Reading Seed Warehouse, 7 and 8, Market-place, Reading, Berks.

AGRICULTURAL SEEDS.

WHITE BELGIUM GREEN-TOP CARROT, 1*s*. per lb.; Altringham Carrot, 1*s*. per lb.; Large Green-top Orange Carrot, very thick-shouldered, and well adapted for shallow soils, 1*s*. 6*d*. per lb.; Long Red Mangel Wurzel, grows well out of the ground, 1*s*. per lb.; Fine long Yellow Mangel, produces roots as large as the red, 1*s*. 6*d*. per lb.; Yellow Globe Mangel, 1*s*. per lb.; Lucerne, 1*s*. per lb.; Italian Rye-Grass, 8*s*. per bushel; Pasture Grasses of all kinds, fine mixed Grasses for Lawns; Skirving's Improved Swede Turnip, 1*s*. per lb.; Laing's do., 1*s*. per lb., &c. &c.—W. J. NUTTING, Seedsman, 46, Cheapside, London.

Garden and Flower Seeds of every kind, as advertised by other houses.

LODDIGES' BOTANICAL CABINET, consisting of coloured delineations of Plants from all countries, with a short account of each, 2000 plates, engraved by George Cooke, and most accurately coloured from Nature, 20 vols. small 4to, elegantly bound, Russia, gilt leaves, 1817-33, price 25*l*. Published at 50*l*., in Numbers, and now very scarce.

WM. JOHN CORMACK, AGRICULTURAL SEEDSMAN by Appointment to His Royal Highness PRINCE ALBERT, New Cross, Surrey, and Bedford Conservatory, Covent Garden, begs to call the attention of the Nobility, Gentry, and Agriculturists in general to his combinations of GRASS SEEDS for Permanent Pasture, the Alternate Husbandry, Parks, Lawns, &c. (as recommended and practised by his partner, the late Mr. GEORGE SINCLAIR, Author of the "Hortus Gramineus Woburnensis.") Upwards of 25,000 acres have been converted to permanent pasture by this establishment with the greatest success. Parties requiring Seeds are respectfully requested to state the nature of the soils. Mangold Wurtzel, Carrot, and Turnip-seed of excellent sorts, saved from transplanted bulbs. Garden and Agricultural Seeds of the best quality and most approved kinds.

N.B.—Cormack's British Queen and Prince Albert Peas, at 3*s*. 6*d*. per quart.

TO GENTLEMEN, FLORISTS, and OTHERS.

MESSRS. PROTHEROE AND MORRIS will submit to public competition at the AUCTION MART, BARTHOLOMEW-LANE, on TUESDAY, APRIL 2d, and THURSDAY, 4th, 1844, at 12 o'clock, a fine Collection of CARNATIONS and PICOTEES, consisting of all the leading varieties; Standard and Dwarf ROSES, Fine Lancashire GOOSEBERRIES, Choice FUCHSIAS, DAHLIAS in dry roots, &c.—May be viewed the morning of sale. Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

EDGING BOX.—To be disposed of, A Quantity of very fine BOX, about 400 yards, at 9*d*. per yard. To be seen by application to RICHARD TURNER, Green-lane, Battersea.

TO BRICKMAKERS, FARMERS, and OTHERS.

FOR SALE, about 1000 Chaldrons of ASHES and BREAZE, and about 1000 Loads of MANURE, lying at Albion-street, and near King's Mills, where barges may be loaded. Apply to Mr. THOS. AVERY, Albion-street, Rotherhithe, Surrey.

ELIGIBLE INVESTMENT.

TO BE SOLD, with immediate possession, a Freehold DWELLING-HOUSE, SHOP, &c., and about Six Acres of rich, productive Land, fully stocked and cropped, on which an extensive business in the Nursery and Seed line has been carried on for many years, and parted with in consequence of the death of the late Proprietor, who was in business upon the premises for 50 years, and whose books may be inspected, if desired. The House fronts the high turnpike-road, in a good market town 20 miles from London. Part of the money may remain on mortgage, if desired.—Apply to Mr. THOMAS JACKSON, Marlborough-road, Old Kent Road.

MOUNTFIELD, SUSSEX.

TO BE LET, and possession had at Michaelmas, 1844, MOUNTFIELD-PARK, and GLOTTINGHAM FARMS, containing about 500 acres of excellent Arable, Pasture, and Hop Lands.—For particulars, apply to Mr. JAS. HILDER, Robertsbridge.

W. JACKSON AND CO. beg to offer the following PLANTS, at the very low prices attached:—Tropæolum azureum, 12s. 6d. each. Also, well-established in 48-sized pots—Veronica speciosa, 21s. each; Clematis Sieboldii, 20s. per dozen; C. azurea grandiflora, 24s. per dozen. Fuchsias.—12 of the most approved distinct new varieties, including a very beautiful Seedling not yet sent out, which they warrant will give satisfaction, 24s. Delivery at the railway station gratis. A reference or remittance from unknown correspondents is respectfully solicited.
Cross Lanes Nursery, near Bedale, Yorkshire, March 25.

MESSRS. MARNOCK and MANLEY beg to inform their Friends and the Public, that their DESCRIPTIVE CATALOGUE of FUCHSIAS, VERBENAS, CINERARIAS, DAHLIAS, &c., with a Treatise on the best and most successful Modes of Cultivation, is now ready, and may be had on application
N.B.—Their beautiful Fuchsia, MARNOCK'S PRINCESS SOPHIA, is now ready to be sent out; the stock is not large, therefore early orders will prevent disappointment.
Nursery, Hackney, March, 27, 1844.

The Gardeners' Chronicle.

SATURDAY, MARCH 30, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

MONDAY, April 1	Entomological	8 P.M.
TUESDAY, April 2	Horticultural	3 P.M.
	Linnæan	8 P.M.
WEDNESDAY, April 8	Society of Arts	8 P.M.
FRIDAY, April 12	Botanical	8 P.M.

WE have now before us a goodly crop of letters upon the speculations of Mr. W. Wood as to the principles on which the *rationale* of potting is, as he supposes, dependent. When his paper on Fuchsias shall be concluded, we will endeavour to explain what we understand to be his meaning; and, at the same time, the letters of our correspondents shall be duly noticed. In the mean while, we must beg to set them right on one or two points.

Some seem to imagine, because we have directed attention to Mr. Wood's paper, that therefore we adopt his reasoning as our own. They could not have fallen into a greater error. Our own little children demand all our care, and our benevolence does not go to the extent of accepting the paternity of other people's productions. Although our observations upon the paramount importance of studying the principles of horticulture were connected with the paper on Fuchsias, we did not intend that they should be interpreted into a eulogium of the particular views promulgated by its author. It is one thing to speak with praise of the general tendency of a man's writings, and another to approve of their details. What we wished was to induce gardeners *to think*, and *for themselves*; and to accustom them to *search* for the true causes of the most common operations of their art.

Suppose Mr. Wood's notions about the properties of matter, in connexion with the art of potting, to be wholly wrong, that would not alter our opinion one iota: they are new; they are an attempt to explain on principle a very important process upon which scarcely a thought has been bestowed by science up to the present hour,—and that is enough for us. His paper is a step in the right direction; and its errors will lead to discussion and consideration, out of which the right will spring. The assertion of Democritus that the goddess Truth resided at the bottom of a well was full of wisdom. The wrong reasonings of a thinking man are like failures in experimenting—they pave the way to success hereafter. The bad physiology of Linnæus opened a road to the just views now entertained of Vegetable development; if it had not been for the false speculations of the alchemists, chemistry would have been retarded for centuries—without a Paracelsus there might not have been a Davy; the dreams of Descartes led to the philosophy of Kepler and Newton; and who shall say that the misty revelations of Mrs. Ibbetson did not herald the brilliant observations of Brown, Mirbel, and Schleiden?

Another class of correspondents protests against the obscure style of the paper on Fuchsias. But shall we throw away our corn because of the chaff that hides it? or shall we not rather sift and winnow it patiently until the valuable grains are separated, and the refuse is cast to the winds? And so it should be with the writings of man; for it may happen that the truest thoughts are concealed by the obscurest words, and that what reads smoothly and speaks instantly to the apprehension will produce an effect as fleeting as it was sudden. It is more profitable to fish for gold in muddy waters than to gaze on pebbles through a stream of crystal. Not that we are advocates of a perplexed and confused style, which is a real misfortune to both reader and author; but we would not, on that account, discourage the endeavours of untaught men. On the contrary, we regard it as one of our most important duties to employ the power which education has conferred upon us in assisting others to whom Providence has not given the same advantages. We confidently trust that our readers will think that we are right.

FUCHSIAS.

(*Continued from page* 179.)

Some may wonder at my recommending plants to be retained in the pots supposed to have a defective arrangement of soil; it will therefore be as well that I should offer reasons for the recommendation; which is founded upon the principle (page 20, 1844) that "the accumulative vigour of all plants is exactly in proportion to the progressive agency of the causes to which they are first subjected." Many years' experience has convinced me that the larger the quantity of mould in pots, within reasonable limits, the more rapidly and safely are plants capable of acquiring vigour; other processes interfere more or less with their vital organs. To remove a plant from given conditions before it is capable of availing itself of such conditions, is opposed to reason and sound practice. In all cases of defective drainage in pots, it is found that the mechanical arrangement is unequal to the external pressure which acts upon the material.

When the principal buds are formed as young branches, they may be shifted from small, or large 60, to large 48 or 32 pots, according to their vigour, using two parts turfy friable loam, 2 of well-pulverised cowdung or leaf-mould, with upwards of one-sixth of sand. If the soils are such as to part readily by the hand, which, in a turfy state, is a certain test of its being well pulverised, sifting may be dispensed with; if otherwise, for the first shift, the soil may be passed as closely as possible through a sieve of 6-eighths or 1 inch in the wire; and in all cases when the several parts are sifted, the whole of the portions should be passed through together, and not separately—the latter method reduces the texture too much. Previous to shifting, the plants should be in a uniform state of moisture, or, otherwise, well watered when turned out of their pots, so that surface-watering may be dispensed with for one or two days after potting; during which period, the newly-applied soils being exposed to the influence of sun and air, become less retentive, and more fitted to receive repeated waterings.

In the process of potting, the bottom-drainage should (especially in the first operation) lie tolerably loose over the bottom cavity, the potsherds or other material lessening in size upwards. The sub-drainage of coarse flakes of partially-dried leaf-mould, or cowdung, or dry open turfy loam, should be pressed tolerably firm. Of the soil generally, the coarsest and most open portions should occupy the lower and middle positions in the pot, and the finer should be towards the top. As to pressing down soil in potting, that should be regulated in proportion to the vigour and size of the plants: being most considerable on the lower portions, and slightest towards the surface. The smaller the plant, in proportion to the quantity of soil in which it is placed, the more uniform and slight should be the pressure. The entire surface of the soil should slightly incline towards the edge of the pot; but this should not be managed by greater pressure round the edge; the soil should be originally arranged in that way.

After the first process of potting, the plants are to be placed upon inverted pots on the front platform of the forcing-house, to admit a better exposure to air and light, and for the first forty-eight hours they should be plentifully syringed; then, morning and evening, the front lights being closed for the time stated; and if sun-light becomes powerful, they should be shaded from 11 to 2, 3, or 4 o'clock, in proportion to its intensity, if in a west aspect; or earlier and later if facing the east.

After the surface soil shows that it has been sufficiently exposed to the air, by beginning to require water, the plants may, in the first instance, receive enough to pass through the whole amount of soil. The second application should be applied with judgment, and, to avoid excess, may, in part, be supplied by a copious syringing. Such precautions may appear trivial and unnecessary, but a difficulty will be found in drawing a line between the application of water to recently heavy-shifted plants and others. Alternate syringings are more beneficial for a short period, in such cases, than repeated waterings, allowing for casual exceptions.—*William Wood, Pine-apple Place.*

ON THE CULTIVATION OF GRAPES IN POTS.

THE first impulse given to fruiting Vines in pots was by a paper in the "Horticultural Register for 1831," by Mr. G. Stafford, then gardener at Willersly Castle, in Derbyshire, and which at the time elicited much surprise. Through him I became practically acquainted with the system he followed; and since then having been more or less engaged annually in preparing and fruiting a considerable number of Vines in pots, I can safely bear witness to the successful results that will follow the practice detailed below.

After fixing on the kinds of Vines you intend growing, the first thing to be done is to procure eyes (or buds) of the required kinds, from some known good bearing Vines, taking care to have the wood perfectly hard and ripe, with the eyes prominent and round. If the Vines are intended to be fruited the next season, the eyes should be potted in 32-pots, placing them one inch below the surface, and using soil of a light turfy nature, or if stiff, adding a portion of half-decayed leaves; only one eye must be planted in each pot. This should be done early in February, and when finished the pots containing the eyes may be plunged in any pit or frame that may be at work, where a bottom-heat can be maintained of 90°, or thereabouts. They may remain there until growth has commenced, when sun-light being indispensable to the welfare of the young plants, they should be placed (if they were not previously) as near the glass as possible, sinking the pots as the plants reach the glass, but still keeping a steady bottom-heat, and supplying them with air every day if possible. It is supposed that the heat of the frame or pit varies from 60° to 90° in sunshine. When the pots are filled with roots, which will be some time in April, they may be transferred at once into their fruiting-pots, which should be 2s or 4s, according to the strength you wish your Vines to attain; bearing in mind that those in the smaller size will ripen their wood earlier, and consequently be available for forcing at an earlier period than the others. This operation will bring us to a consideration of the description of soil or compost most suitable for the Vine. When growing naturally out of doors the Vine will flourish in a variety of different soils and composts; but when its roots are confined in so small a space as a pot, we must place within the action of its roots that kind of soil from which it can most readily assimilate the elements which constitute its food. After trying nearly all the different composts recommended by the numerous authors on the Vine, I am convinced that the more simple the constituents of the soil are for it, or any other kind of pot-plant, the more successful will be the results. The compost I use is two-thirds turfy loam, from a down having a chalky bottom, and one-third decomposed night-soil. Should the loam be strong, I use the same proportion of half-rotten horse-droppings. The turves in the loam should only be half decayed, and it should be used as rough as possible.—*John Spencer, Gardens, Bowood.*

FAMILIAR BOTANY.

MORPHOLOGY, No. IX.

Lo! on each seed, within its slender rind,
Life's golden threads in endless circles wind;
Maze within maze the lucid webs are roll'd,
And, as they burst, the living flame unfold.
The pulpy Acorn, ere it swells, contains
The Oak's vast branches in its milky veins!
Each ravell'd bud, fine film, and fibre line,
Traced with nice pencil on the small design;
Grain within grain successive harvests dwell,
And boundless forests slumber in a shell.

THE manner in which the embryo plant of the Yew-tree is formed is essentially the same as that which is observed in all other flowering plants; and therefore, without confining our attention to the Yew, we may now proceed to consider in its general sense the value of the knowledge gained by an examination of the manner in which the embryo Yew goes through its various changes till it arrives at that first stage of perfection in which it may remain asleep, for ages perhaps, until the fitting circumstances awaken its germinating powers, and call it into a new and active life.

It is plain that the embryo of the Yew was at first a few microscopical bladders, arranged in a loose and apparently confused manner; that through various changes it arrived at another and much more perfect condition, in which the bladders are collected into a solid mass, having a definite form, with a pair of lobes at its free end. Let us now suppose that the annexed diagram represents some such embryo plant cut through lengthwise, and placed erect instead of being inverted, like that of the Yew. Three parts are then distinguishable, viz. *c c*, which are called cotyledons; *p*, a point between their bases, called the *plumule*, or in a general sense, the *growing point;* and *r*, a cone, extended downwards, and named the *radicle*. Here we have the whole preparation which Nature makes wherewith to fashion out a plant, with its leaves, stem, flowers, and fruit. In no seeds have we anything more—in some we have not so much. We have nothing whatever except a collection of little bladders, gathered together into a definite form, invariable in each species, and provided with the wonderful power of working out of such materials all that hereafter may be proper to its nature. The cotyledons are, in fact, the first leaves, sometimes having a peculiar shape, but often not distinguishable from those which succeed them. The plumula, or growing-point, is that which lengthens upwards, and changes into a stem clothed with leaves, flowers, and fruit. The radicle goes downward, and gives rise to the root. The embryo is, in fact, a young plant, whose bones, sinews, and breathing apparatus are not yet formed, but out of which they have to be developed; and it consists of a root and short stem, with one pair of leaves upon it; or, to use the language of morphologists, of an axis and its appendages. The axis gives birth to all the future ramifications above and below ground; the appendages are the rudiments of what, in one state, are called leaves, in another, flowers, in a third, fruit, as I shall next proceed to show.

When the poet exclaimed that "every heart contains proportions germ," he did not dream, perhaps, of the extent to which that beautiful truth may be applied. What crowds of proofs rush forth the instant that the veil of Nature is withdrawn but for a little space!—*R. E.*

REMOVAL OF TREES.

WOULD any of your correspondents oblige me with their opinion respecting the best time for cutting a trench round large trees to prepare their roots for future removal? Winter seems, according to my practice, to be preferable to spring, after the buds have begun to swell; and it is possible that autumn, or as soon as the leaves begin to fall, may prove a still better period for that operation, and that the descending sap would form the commencement of new roots, in lieu of wood on the stem, in readiness to shoot with vigour in the spring. This experiment was neglected last autumn, but it probably required a trial on an extended scale, in consequence of the variable growth of the roots of trees under apparently similar conditions. The question is asked, in the hope that it may meet the

eye of parties willing to try comparative experiments in different soils and situations.

A rapid formation of roots has been remarked to have taken place in autumn in large shrubs (Laurels) which were taken up last September, and heeled close together with some loose earth thrown over their roots, for subsequent planting at leisure during winter. And a similar occurrence was observed some years ago in similar shrubs that were lifted, and replaced in their holes in August: their subsequent removal about November was remarkably successful. Loose earth seems more favourable for the formation of young roots than the tight packing of the balls, according to Sir Henry Stewart's method, adopted when more care and attention is paid to the removal of better plants; yet this last operation is essentially necessary, before the ground is dried up by summer heat. On the whole, the double removal seems to have been most successful. Doubtless good roots will be formed by early autumn cutting. The question may be asked:—"Will it be at the expense of the buds for the ensuing year?"

Having adopted some variations in the mode of taking up large trees from that recommended in the "Planters' Guide," which tend both to reduce its expense and risk of injury to the roots, I will venture to detail the method in which that operation has been conducted for some years past, and its cost during the present season.

As soon as the surface-roots have been cleared in the trench, the tree is firmly secured to a pole, of 22, instead of 15 feet in length, by three or four lashings formed of five or six rounds of 1-inch rope, frapped together. The carriage and tree are then hove down by a purchase applied to the top of the pole, consisting either of two single blocks, or a single and double block, and a 2½-inch rope (shroud laid).

Infinitely less injury seems done to the lower roots by tearing them up than would be occasioned by undercutting the ball, while the surface-roots entirely escape the handling and turning back that would otherwise be required to enable men to work below them.

The strain on the carriage and stem of the tree is, however, extremely severe; but the bark of Turkey Oaks of 8 inches in diameter is capable of lifting near 2 tons of earth without injury, in ground that is unfavourable for the formation of tap-roots, when properly secured, that is, wrapped up in pieces of old sacking. Only one soft-barked tree (a Lime) has been removed exceeding 8 inches diameter near to the roots; it bent under the weight, about 2 tons of earth, and, had the least slipping of the lashings occurred, it is obvious the bark must have been stripped off. The bark has been injured for a few square inches, where it bore on the straw matting. The plan is clearly not suited for such trees.

While some of the men are employed in tying up the branches, one of them shifts the upper block from the pole to the axletree; 5 or 6 fms., however, of rope, fixed to the axle, would be preferable, as the block could be hooked on at once; the carriage is then quietly drawn out of the hole by a horse, at just one-third of his speed. In many cases it is requisite to shift the purchase, so as to draw out the carriage with the roots forward. The work done in five days by four men was—an 8½-inch tree in diameter in the morning, and a 6-inch tree in the afternoon. A horse was brought by another man at half-past 10, and at half-past 3 o'clock, which are charged at half a day each.

4½ Men, at 20*d.*	.	.	7*s.* 6*d.*
½ Horse, at 3*s.*	.	.	1 6
A load of compost	.	.	1 6
			10 6

To this must be added an hour's work for two more horses, if the tree is removed up-hill. The larger tree may be taken at 6*s.* 6*d.*, and the small one at 5*s.*; their average height was about 35 feet.

The carriage is roughly made; its cost was 2½ days' labour for a carpenter, and 2 days for a labourer to assist, and about 25 lbs. of iron-work to fix it on a pair of strong and broad cart-wheels, 6 inches wide, and 4½ feet high. The pole is a small-leaved Cornish Elm, exceeding 8 inches in diameter at bottom, and rather less than 6 at top. The bed was adzed out of a waste piece from the fork of a large Scotch Fir, 18 inches deep.

a. Pole of Elm, 22 ft. long, 8 in. diameter at bottom, and 5¾ at top.
b. Ash stay, gammoned up to the pole with inch stuff.
c. Rough piece of Scotch Fir, adzed down.
d. Do., Scotch Fir. *e*. Side stays. *f*. Mat of straw.
The pole is placed high, to enable the lashings to be made more secure.

On calculating the solid contents of wood in the carriage in cubic inches, it amounts to about 11 solid feet, hence its weight is about 5 cwt.; and about 3½ tons would be the probable limit of the load for the axletree.

The wood in the previous carriage was crushed, in consequence of decay, and the axletree was bent by the strain in taking up a tree.

It is obvious that the success of these operations is entirely dependent on the lashing of the tree securely to the pole; it can be managed with the greatest ease, if a labourer can be found who has been a few months at sea, otherwise great attention must be paid to this point, and perhaps some failures from slipping will occur.—*E.*

Home Correspondence.

Whitney's Composition.—To the many notices of the successful application to the purposes of Horticulture of Mr. G. Whitney's (of Shrewsbury) Transparent Composition which have appeared in your columns, permit me to contribute the following, which I doubt not will be perused by your numerous subscribers and readers with similar gratification which resulted to myself from its examination. During the last few weeks Mr. Whitney has erected in his garden a house 28 feet long by 12 feet wide and 15 feet high, covered entirely with muslin prepared with his Transparent Composition. Internally the house is divided into a stove-pit, heated by a hot-water apparatus; and a greenhouse or conservatory. In the stove a Vine (Black Hamburgh) has been introduced (for experiment), which bids fair in a very few days to be clothed with healthy and luxuriant foliage. Cucumber plants inserted there are thriving well, and never flagged or drooped in the least on their removal, although not shaded. In the greenhouse compartment Pæonies, Fuchsias, and other plants, are healthily putting forth strong and vigorous shoots. Indeed, the whole promises speedily to be a scene of great beauty and luxuriant vegetation. Nor can it fail to be so, the light being so clear, abundant, and yet subdued, being very similar to that reflected from a white cloud, quite unaccompanied with any glare, and admirably and equally diffused throughout every portion of the house by the singularly radiant and repeated reflections from the white coverings, walls, and surfaces. The temperature in the stove, which is usually kept at 80°, is well and uniformly preserved, the air-tight nature of the whole apparatus not suffering it to fall more than a very few degrees even during the late cold and severe frosty nights, although very little fire has been kept up. In addition to all this, economy speaks loudly, the cost of the prepared muslin not having exceeded one-fifteenth that of glass for an erection of similar dimensions. I trust to hear that so successful an example has been followed throughout the kingdom, and that the time is near at hand when every one devoted to gardening in any department, however humble his means, will be found gratifying his taste in the possession of greenhouses, &c. similarly constructed, with this useful composition, for the ingenious invention of which the cordial thanks of high and low are abundantly due to Mr. Whitney.—*Botanophilos.*

Durability of Oak.—There can be no doubt that the supposed date, 1035, on the Oak-beam taken from a house near Oswestry, is not of the time assigned to it. One of the earliest authenticated instances of the use in Europe of Arabic numerals is the date 1375, written by Petrarch on a copy of St. Augustine's works. When the use of these numerals was first introduced into England is doubtful, but they were, at all events, not used in keeping the accounts of the English colleges till near about the beginning of the 16th century, and it is very unlikely that they came into vulgar use till long afterwards; they are of rare occurrence in writings of the first half of the 16th century. But is it certain that the figures 1035 were used for a date at all? May they not be the mark denoting the number of a lot of wood, or the private mark of a tradesman?

The Vine.—There is a very singular and perplexing statement by "R. P." at p. 166, respecting the fruitfulness and unfruitfulness of his Vines, that are subjected to the heat of a fruiting Pine-stove. The subject is worthy of the attention of practical men; it opens up a wide field for discussion. "R. P." prunes his Vines on the spur system, which is good; but why does not the shoot trained across the bottom of the light and up the adjoining rafter bear equally with the parent stem? First, is caution used to make the wood on both rafters break its buds at one time? Although the wood is ever so promising on the adjoining rafter, if the parent stem breaks its buds while the other is dormant, I have not the least doubt but that what would have been fruit on the adjoining rafter will be converted into tendrils; the organisable matter stored up previously, and while the Vine was at rest, should the parent stem take the lead in breaking its buds, will be drawn to the support of them, more especially as it has a clear upright course, not receiving a check in having to flow horizontally before it reaches an upright position, as in the other stem. There is still some mystery with regard to the Black Muscat (a Grape I am not acquainted with—perhaps a synonyme of the Muscadel or Morocco, neither of which is calculated for a fruiting Pine-stove, being late Grapes: should it approach its congener in size of bunch, berry, and flavour, it will be a desirable variety). There is no obvious reason for its sterility, unless, being a late Grape, it is impatient of heat at an early period, which experience teaches is one great reason of its being abortive. I should wish to be informed regarding "R. P.'s" system of summer pruning, and whether he follows the system of disbudding, as mentioned in my treatise on the Vine, as on that, and attention to the roots, will, in a great measure, depend the fruitfulness of his Vines. The following case occurred here last season. I have three succession Pine-stoves, with upright glass in front, 2 feet 6 inches high; the rafters and back walls are covered with Vines, besides a late Vinery. In my earliest house of Grapes, which is one of the above Pine-stoves, I had, at the time of planting, in 1839, to one of the rafters planted a White Muscat, which proved wrong to its name, and turned out to be a Black Morocco (which is a valuable late Grape, and keeps equally well with West's St. Peter, but it is not suitable for an early house); last season I cut it away, intending to bring in a white Muscat in its place. On the adjoining rafter is a Hamburgh; after it had pushed shown fruit, and the shoots were stopped, a thought struck me of carrying out my method of disbudding still further, and marking the result; accordingly, I selected the bud on the lowest spur below the angle of the rafter, near where the stem of the Vine entered through the sill in the wall, and conducted the young shoot as it progressed in growth across the bottom of the light and up the adjoining rafter, taking off all tendrils and laterals as they appeared, and disbudding the shoot, as I do in autumn, as it advanced in growth, or as soon as I could perceive that the buds were formed. This, by many, would have been thought a dangerous experiment, operating on the growing shoot. I then stopped it at 14 feet in length, including the portion across the bottom of the light and to the bottom of the parent stem, intending to prune it back to 12 eyes; I allowed three laterals to remain at the extremity of the shoot, to keep it in check, which I stopped with caution, and removed altogether in a few weeks afterwards. I left 12 eyes for spurs, 6 on each side, and not a single bud broke untimely under the experiment: using caution, the buds broke with the parent stem when I began to force; and the result is, that this season the 12 eyes have shown 31 bunches of Grapes. I forward you a specimen from a young cane of a Cannon Hall, carried up in a similar manner, that was not disbudded while it was growing, but operated upon (according to my usual practice) when it had attained its full growth; it has shown three and four bunches at one eye: the specimen sent is from an eye producing four. If "R. P." will observe the following three points, viz., timely stopping at summer pruning, in order to induce his Vines to make strong wood; disbudding as soon as they have made their summer growth, or, with caution, at the time they are making their growth, taking care that they break the whole of their buds regularly, under as low a temperature as is consistent with the welfare of his Vines; and paying attention to the root—I imagine he will find little cause for complaint.—*James Roberts, Eshton Hall.* [The specimen sent promised to be a very large bunch. It contained 2816 flowers!]

Old Wall Nails.—When a boy, many a long cold day I have sat in a cold shed on a stool, having a square piece of iron fixed in one end, similar to what a blacksmith makes use of in preparing horse-shoe nails, with a hammer, rap, tap, tapping, cleaning and preparing in readiness old wall nails for the men who were nailing and training the wall-trees. Many a tap it required to get one thousand cleaned for use, letting alone, if possible, any extra raps on the thumb or forefinger when the hands were cold. I then resolved, if ever I should myself get master of a place, and have old wall nails to clean, that I would adopt some more expeditious method. When attending Covent Garden Market, I observed that the fruiterers had a very clever and expeditious method of cleaning old Nuts and Walnuts of dust and mildew; putting a quantity into a sack or large bag, a person took hold of each end of the sack and worked it to and fro to each other, in the same manner that two stone-sawyers use a cross-cut saw; the friction soon cleaned and brightened both Nuts and Walnuts. By turning them into another sack, and dropping a very small portion of oil among them, and well working them in the same way, the Nuts would look as clean and bright as if they were quite new. Imagining that it would be a famous plan for cleaning old wall nails, I took the first opportunity of putting it into practice; it answered my expectations admirably: putting about five thousand into the sack at one time, along with two or three handfuls of coarse, sharp, river or sea sand, and working them as above recommended, in about twenty minutes or half an hour's friction they turned out as clean as new pins. By turning them into a suitable sieve or basket, the dust may readily be separated, and thus all the old nails of a large garden may be thoroughly cleaned in a few hours; if they are particularly wished to be kept free from rust afterwards, you have only to drop a small quantity of oil amongst them, and give them another good working in the sack.—*Observer J.*

Seed Steeping.—If I understand the theory of the steeping process, the body of the seed, i.e., the cotyledons or what answers to them, being of a lower order of organisation than the germ or actual seat of active vitality, is charged by art with a larger quantity of saline and other parts than what was originally furnished by nature; that the germ, on being awakened to growth, and finding an unusual supply of nourishment, vegetates with a proportionate vigour of growth. This I can understand, but that the process, upon the above principles, should so entirely influence the vegetation of a whole season, as possibly to render subsequent manuring unnecessary, is not so easily conceived. The effect of this earliest of all manuring so instant upon germination, and as it were so close to its work, appears to be to induce in the case of the cerealia a profuse tillering or production of fruitful shoots. Now, a plant, like an animal, is increased by the assimilation to itself—to use an old-fashioned term—of certain heterogeneous substances derived from without; in other words, by absorption by root and otherwise of various mineral and organic substances, and by its own peculiar system of combinations, converting them into its own substance. When, then, the young embryo has consumed the nourishment afforded by its placenta, and Mr. Bickes's sulphate of ammonia into the bargain, and is thrown upon a barren world to seek subsistence, how is it by its multiplication of parts more capable of production than before? and will it not feel want of food, with its superior number of mouths, equally with any unpickled companion? It would appear that a saving of seed may be effected, assuming that three seeds affording two stems each, are no better than one with three, the amount of

nourishment being the same. The opinion of Mr. Campbell, or any one conversant with the subject, would, I am sure, be as acceptable to many readers as to myself.—*Micklewell.*

Morphology.—If this doctrine is a fallacy, as some assert, why is it that the art of the cultivator can have any influence in bringing plants into a blooming state? How is it that we hear and read of certain modes of treatment causing plants "to grow to leaf, and not to blossom?" and others, again, by means of good management, even in artificial cultivation, made "to exceed the splendour of native specimens?" I imagine it may be referred to Morphology; for I conceive that it seeks to establish these most important truths, viz.,—firstly, that all vegetable bodies, varying as they do in their appearance, are but modifications of the same kind of matter, created by the same power, from the same source—nothing, and imbued with a mysterious property of extension and reproduction; and, secondly, that this matter is not, indeed, convertible from one organ to another, but capable of being developed either in one form or the other, as the circumstances to which it is exposed may have influence over that development. And, if this is Morphology, then every gardener daily demonstrates its truth; for why else does he prevent the blooming of annual plants when he wishes to preserve them beyond a single season, or, on the other hand, why does he adopt any particular course of treatment to induce a state of bloom in his plants? This refers to cultivated plants, and these being removed both from their natural situations and the natural circumstances of their growth, afford the strongest proof of the correctness of the science; for, why else could their removal from their natural circumstances influence the nature of their development at all? This by no means interferes with the order of Nature's laws; flowers are flowers still, and leaves are leaves, but what would be leaves, under certain conditions of growth, would be flowers if those conditions were changed soon enough, and the requisite conditions supplied. In all this there is no imputation of imperfection—no atheism—no infidelity.—*T. Moore.*

Cement.—I have used with unvaried success for joints to pipes and fittings for steam-engines of 14 and 16 horse power, a composition formed of iron-filings, muriate of ammonia or sal ammoniac (quantities indefinite, say four ounces to one pound of filings), and a small quantity of brimstone in powder, mixed together with water, so as to form a stiff paste, to be well rammed into the crevices and joints. Another is, ground white-lead, and a sufficient quantity of red-lead powder mixed, so as to make it of the consistence of stiff putty; this is spread on a flange of millboard on both sides, and placed between the pipes or joints.—*W. Rayner.*

Transmitting Cuttings to India.—All the cuttings that have been received at Calcutta by the Overland Mail, had been taken from the middle of last year's shoot, or nearly so. Such cuttings of plants that are difficult to propagate are never used in India, as they are considered useless. Our mode is this—1 or 2 joints or eyes of last year's wood are cut off along with the whole of this year's wood. If the shoot is not too long for a large hand or bell-glass, it is not topped; but if it is, we cut it to a reasonable length, say six or seven inches. The cutting, when made, is somewhat in this form ⊥. Before sending them from England (if the shoot is too long), as much of the top as is necessary may be cut off, provided five or six eyes or joints are left. I beg to mention that I only refer to plants that are difficult to multiply from cuttings in any climate. Some time ago Mr. Beaton says, "August is the best time for taking the first steps for preparing cuttings of fruit-trees, &c., destined to go by the Overland Mail next November to India or China. With regard to Hindostan, from experience I can say that August or November are not suitable months to send cuttings here; for the following reasons—the rains set in in June, and cease in October; the rainy season is best for raising plants of any kind, whether hard or soft-wooded, from cuttings; and if they are sent here by the November Overland Mail, the time mentioned by Mr. Beaton, they arrive here during the dry season, and only a few weeks before the commencement of what we call our hot season. We are glad if we can only keep life in our plants during the hot months. The time that cuttings should be sent to India is at the commencement of the rains, about the 20th of June; although they are a fortnight later it is of little consequence, but they should not, on any account, be sooner, as they will not succeed. Cuttings taken off in the winter or spring pruning, and 'heeled' in the ground until the grafting season, are the sorts that are likely to succeed, provided they are taken off with a little of the old wood attached, as already mentioned. We never put in cuttings of hard-wooded plants in the dry or hot months, as they root so readily under glass during the rainy season, being simply shaded from the hot sun with mats.—*R. Ross, H. C., Botanic Garden, Calcutta, Nov.* 3. [Sending cuttings to India in April and May, exposes them to travel in the driest and hottest time of the year. To put cuttings of European trees into the ground in the tropical climate of June, although best suited to the plants of such latitudes, is of doubtful expediency. The true course appears to be that adopted at the India House, by Dr. Royle, of sending all European plants, in the first instance, to Saharunpoor, in the quasi-European climate of the hills, where they can be easily established and prepared for subsequent transmission experimentally to Calcutta. Many of our European plants thus sent, are now flourishing at Saharunpoor, under the care of Dr. Jamieson.]

Bees.—A "Lover of Bees" may rest assured that there is no probability of the Bees seen hovering about the place where their hive had been taken from, joining with those in the other hive; they would soon find the way to their own. Why the hive was tenantless in spring, whilst it contained "about a stone of honey," is probably, owing to there not being a sufficient number of Bees reared in autumn to supply the places of those that die off. If the second swarm had not left the stock, the case might have been otherwise; for most of the Bees in it were young ones, and would have been the principal stay to the hive during winter and spring. In all cases that have come under my notice of Bees dying whilst they had plenty of honey, there was always a sad falling off in their numbers in autumn. A few days ago, I found in one of my boxes a handful of dead Bees at the top between two of the combs, where there was little or no honey, but there was plenty in the others, and it is easily got at through the thoroughfares or holes in the combs. This contradicts the statement, that "except hives are sticked there will be no passages through the combs."—*J. Wighton.*

Bees.—The season has commenced for examining stocks which have survived the winter; they should now be gently lifted up from their stands, and have the floors thoroughly cleaned, removing all dead Bees, particles of broken combs, or any filth that may have accumulated during winter. It is sometimes necessary to scrape the floors, using for the purpose a strong carving-knife, or sharp garden-trowel, in the first instance; and then finishing them with a stiff hair-brush. It is advisable to place the hive upon a broad board, or stand, during the short time required for cleaning. When the floor is finished, carefully place the hive exactly upon the spot from which it was removed, and endeavour to do so without injuring a single Bee, as they are all required at this season. The entrance, or door-way, should next be carefully attended to; it may be enlarged or contracted as the number of Bees require it, but never allow the opening to be more than three-eighths of an inch high, and six inches long; this size is required previous to and at the time of swarming. This is a matter of more importance than many Bee-keepers are aware of, as it prevents robbers from entering, either in spring or autumn, and allows the Bees an easier passage in and out during summer. These things being attended to, next endeavour to ascertain what honey is in the hive for the support of the Bees during the next two months; if it is scarce, do not neglect to feed them abundantly. Several articles on feeding were given in the *Chronicle* in the early part of last spring; which, if attended to, will save many poor stocks from starvation, and ultimately render them more productive than might have been expected.—*W. Savage, Swaffham, Norfolk.*

The Balsam.—Having some three-year-old seed, sowed it last year in the first week of April, in 24-sized wide-mouthed pots, and placed them in a Cucumber-frame. When they were up, and had fully expanded their seed-leaves, I removed them to a warm part of the greenhouse, taking care to keep them free from damp. As soon as they had attained sufficient strength, I potted them off singly into 48-pots, inserting them in the soil up to their seed-leaves, and plunged the pots into a tan-bed, where they had a bottom-heat of from 50° to 55°. The plants were kept as close to the glass as possible, and they had plenty of air given them in fine weather. I supplied them plentifully with water, and syringed them over-head when the house was shut up in the evening, as they are fond of a damp atmosphere. By this treatment the plants soon became strong and bushy. All flower-buds were removed as they appeared, until the plants were finally potted into 24, 16, or larger-sized pots, according to the growth I wished them to attain. The compost consisted of one-half strong loam, well mixed with rotten dung and old brick rubbish; it was prepared three weeks previously, and placed under cover until it was required. Before plunging the plants the last time, the heat in the bed was renewed, by forking the tan over, taking care to maintain the heat the same during their growth. The plants are occasionally turned, in order to keep them straight. As they came into flower, they were removed to the greenhouse. While in bloom, I supplied them plentifully with water, which they require then as well as throughout the various stages of their growth. The greenhouse was well-aired, in order to preserve them longer in bloom.—*J. F. M'Elroy, Clapham-common.*

Grafting the Luculia.—I have been more than once reminded that I ought to fulfil the promise I often made last year with regard to grafting this plant, which is difficult to increase by cuttings. The truth is, after I mentioned the subject, I felt a diffidence in recommending one stock more than another, for the purpose—as in such a very large order as the Rubaceæ, to which the Luculia belongs, there must be many plants on which it might be easily grafted. During this spring I found a much better stock for it than the one I used last autumn, and perhaps one that will answer better; experience alone, however, must prove this. Of late years most gardeners have studied the affinities of plants more or less, and with such men it is not a question whether this or that plant can be grafted on others of the same nature, but which of them is best suited for the purposes of cultivation. The way to determine the choice of a stock in a case of this nature is easy enough, if you graft evergreens on evergreens only, and deciduous things on deciduous; but this rule is violated every year: then the periods at which the two plants naturally begin to grow and go to rest, should correspond as near as possible; and lastly, they should correspond in the size they attain under cultivation; besides, the stock in all cases ought to be more hardy in its constitution. If the plants thus agree, and yet are known to differ in respect to the soil in which they grow best, we are satisfied in practice to use that soil which is best for the stock; but this is a point in gardening still open for experiments; however, when the Rhododendron flourishes in clay and strong loams, so different from its natural soil, we may rest satisfied in preparing that soil which we know to suit our stock, although the plant from which the graft is taken might refuse to grow in it. Naucles Cadamba is the stock I used for the Luculia last year; it is well suited for it in all respects, except that it is a stove plant, and for this reason I object to it, and to many others equally suitable among Gardenias, Hymenodictyons, Exostemmas, &c. The plant I now use, and which I think is the best in every respect, is Burchellia capensis; and I do not know of any other plant in this large order which is more likely to make a permanent stock for the Luculia; and, no doubt, plants of it worked on this stock will be found easier to manage by those who find any difficulty in growing this, the most lovely of all our late flowering plants, when well managed.—*D. Beaton.*

Miscellaneous.—*Petts* states that a packthread-string, about 6 inches from the ground, round a bed of Cabbages, is a sure protection from rabbits.——*A. R. C.* begs to suggest to all Bee-keepers the advantage of sowing at this season a small patch of Bokhara Clover. It flowers late, continues long in bloom, the Bees are particularly fond of it, and it gives a very high flavour to the honey.——*Mr. C. H. Smith*, of 41, Queen-street, Edinburgh, sent a cut specimen of Camellia sasanqua that had been raised and flowered in a Ward's case. The flower was of the usual size, well-coloured, and perfect in every respect; the foliage was of a healthy deep green. Mr. Smith states that it was planted in May, 1842, and has flowered this spring. He informs us that, in the same case, plants of Epiphyllum truncatum, and speciosum, flowered beautifully through the winter, as did also the Cape Jasmine last summer; one of the flowers of which measured three inches in diameter. The case is about 42 inches long, 18 wide, and 4 ft. high; all were planted about the same time.——*William Bishop*, who says that he has had considerable experience in Pine-growing, informs us that he resided for three years near Thornfield, and that during that time he tasted several of the large Pines that were grown there by Mr. Hamilton. He mentions that one of those he tasted was a large Enville, the flavour of which, he says, was excellent; but still inferior to that of two large Montserrats, which he also tasted there. He states that the usual weight of Montserrats grown round Liverpool and Manchester, is from 2 to 4 lbs.; but that few reach the latter weight. Mr. Bishop writes that he has visited many Exhibitions in Lancashire and Cheshire; but that he never saw the Montserrat weigh above 4 lbs. He adds that Mr. Hamilton's Pines and Cucumbers are much superior to what is generally to be met with in that neighbourhood.

Societies.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.

Mar. 7.—This was the spring meeting; it was held in the hall at the Experimental Garden, Inverleith, Sir G. S. Mackenzie, Bart., V.P., in the chair. The hall presented a beautiful scene, each end being adorned with choice exotic shrubs, and the long table in the centre displaying in rich profusion collections of Camellias, Epacrises, Cape Heaths, and Hyacinths. The following prizes were awarded:—For the six finest and newest varieties of Camellia Japonica in flower, the Silver Medal was voted to Mr. J. Young, gr. to T. Oliver, Esq., Newington Lodge, the kinds being C. tricolor, Hendersonii, imbricata, rosea, carnea, and Vandesii; 2, Mr. J. Macnaughton, gr. to J. Wauchope, Esq., of Edmonstone, for Lady Hume's blush, double white, imbricata, fimbriated white, waratah, and double blush. For the two finest specimens of spring-flowering Cape Heaths, the Silver Medal was awarded to Mr. G. Stirling, gr. Melville Castle, for Erica hyemalis, and E. aristata; 2, Mr. Young, for E. gracilis autumnalis, and E. Linnæoides. For five distinct varieties of double Primroses in flower, the Bronze Medal was voted to Mr. J. Thomson, gr. to W. Keith, Esq.; the kinds were white, yellow, crimson, Irish purple, and pale purple. For a beautiful seedling Epacris, the Silver Medal was voted to the raiser, Mr. J. Reid, gr. to Profes. Syme. It was a hybrid between E. impressa and nivalis, with elegantly-disposed foliage, and blossoms of a uniform hue, intermediate between the colours of the parent flowers. For the six finest Hyacinths, in pots, the Silver Medal was assigned to Mr. Thomson, for Ne plus ultra, Triomphe Blandina, Lawrens Koster, La Grande Vidette, Blocksberg, and Monsieur de Fesch; and a second prize to Mr. Young, Newington Lodge, for Grande Vidette blue, Grande Vidette white, Lord Gray, Lord Wellington, Grand Vainqueur, and Voltaire. For three collections of Flowers, two consisting of fine Hyacinths, and the other of beautiful seedling Epacrises, an extra premium was voted to Messrs. Dickson and Co. And another extra premium was assigned to Messrs. J. Dickson and Son, for a collection of rare Plants, in flower, including Centradenia rosea (a small Mexican shrub, densely clothed with blossoms,) Begonia coccinea, a seedling Gesnera faucialis, and Maxillaria Harrisoniæ. A seedling purple Cytisus, raised at Biel, from seeds taken from a purple flowering branch which spontaneously appeared on a yellow Laburnum, was regarded as curious; and for this production an extra premium was awarded to Mr. J. Street, gr. at Biel. A hybrid Rhododendron, in flower, being a cross between R. arboreum album and R. Caucasicum, was exhibited from Dysart House garden; an extra premium was also voted for it. From the Nurseries of Messrs. Eagle and Henderson was a specimen, grown in a pot, of a shrub or tree raised from seeds received from New

Zealand, having the habit of a Pittosporum, but probably quite new. From the garden of Prof. Dunbar, were exhibited two Camellias in flower, one a seedling raised at Rose Park, the other C. Colvillii, with a fine specimen of Erica hyemalis; from Trinity Cottage-garden, a tall and well-furnished plant of Epacris impressa, in full bloom; from the garden at Biel, a most beautiful flowering branch of Acacia affinis, and a specimen of Calla Æthiopica in flower, raised from seeds ripened at Biel, where Mr. Street considers the Calla as completely acclimatised; and from a Ward-case, kept in the drawing-room of Mr. Smith, landscape gardener, Queen-street, flowering sprigs of Camellia Sasanqua, and Daphne odora. There were placed on the table packets of seeds of Bokhara Clover, presented to the Society by the Earl of Wemyss, and of Himalayan Coniferæ, presented by the Highland and Agricultural Society; and also various materials for making steeps for seeds, recommended by Prof. Johnston, presented by Lord Murray. At this meeting various communications were read. The first was an account by Mr. R. Foulis, Fordel, of the mode of dressing for table the tubers of Oxalis Deppei. The tubers are peeled, and the hollow centre cleaned out; they are then well boiled in rich stock, the fat being skimmed off. The tubers are served up hot, with a sauce prepared by heating a piece of butter and a spoonful of flour in a saucepan till browned, and adding a little stock. The next was a notice regarding the successful raising of various Himalayan Coniferæ, especially Deodars, at Elchies, on the Spey, in Morayshire. The seeds, which came by the overland mail, were sown on an open south border in spring 1842, and they all germinated freely. During winter a glazed frame was placed over a portion of the seedlings, but the rest were left wholly exposed, and were repeatedly buried in snow. In spring 1843 the plants left unprotected were as healthy and vigorous as those which had been under glass.—Then followed remarks by Mr. James Macnab on plants grown in water charged with various salts and manures, the specimens being exhibited in glass jars. One general remark was, that when only a small portion of liquid was placed in the vessel containing the plant, and the mass of roots was suspended above the liquid, the plant grew much better than when the roots were wholly immersed.—The next was a communication from Mr. Moffatt, Edengrove, recommending a four-pronged spade, a model specimen being exhibited. This spade he finds more useful than the common spade, when the soil is bound in frosty weather, or when it is very wet in rainy weather, and particularly safe in stirring the soil in shrubberies or in flower-borders.—The last was an interesting and lively account of the progress of Horticulture in Scotland during the last fifteen years, drawn up by the Curator of the garden.

GHENT ROYAL SOCIETY OF AGRICULTURE AND BOTANY.

THE wealth, enthusiasm, and science, entering into the several parts, and forming the combined operations of this Society, taken as a whole, is certainly not surpassed at the present time, by any similar institution in Europe. It has existed since October 28, 1808, and conducted its operations with energy and prudence, as is abundantly proved by the fact, that the present is the 76th Exhibition of the Society; nor is its success less evident, when the improved state of botanical skill, displayed in all their gardening operations, is taken into consideration, especially with respect to whatever relates to propagation. The present Exhibition is the second forming a series of Shows of great magnificence, which are held every fifth year; other Shows are held by the Society (I believe four annually); but the one in question, which is termed "Festival Quinquennal de Flore," is, in all respects, a very great display, both of industry and science. The saloon in which these Exhibitions are held, has been built expressly for the use of the Society, and with especial reference to the Exhibitions; it is 300 feet in length. The centre is a lofty dome, 50 feet wide, supported by two wings, each 40 feet wide. The light is admitted at the roof, and in some cases at the sides; and the plants are arranged along each side, leaving abundance of room for the visitors to promenade without interruption along the centre, throughout the whole length of the building. Under the plant-saloon are offices for business; a small library, and other apartments occupied with specimens of Horticultural and Agricultural implements. There is also a refreshment-room capable of dining 200 persons. The general appearance of the plants, and the aspect of the whole arrangements, were in many respects different to the great metropolitan Shows in England. There were at least three times the number of plants exhibited, that are usually seen at the largest English Shows; but three-fourths of these would not have been considered admissible here, in point of culture, and very few of the plants were above mediocrity in this respect. Such is the zeal and desire for novelty, that both amateurs and nurserymen seem to lose sight of everything else; and such also is their skill and success in propagation, that with them the temptation is quite irresistible to cut up every leaf and bud of a new plant for the purpose of increase, and hence the general absence of well-grown and handsome plants of whatever is new. There is, nevertheless, much to admire and learn from their ingenious and scientific methods of budding and grafting. It is no disparagement to our Belgian neighbours to say that they do not excel in everything; in their knowledge and display of culture they are immeasurably behind the gardeners of this country. The leading features of this great Exhibition consisted of Camellias, Rhododendrons, and Azaleas; besides these, there was a great many collections of miscellaneous plants, both stove and greenhouse; and also hardy plants forced into bloom. The Camellia was, however, the great object of attraction, and is above all others the popular plant in Ghent; every amateur who can afford a greenhouse, however small, esteems it his highest honour, as it is by far his greatest ambition, to be possessed of a few of the newest varieties of the Camellia. In the mode of conducting the Exhibition, and more especially with respect to the manner of judging the plants, there was something of novelty, as compared with the method adopted in this country. Previously to the opening of the Exhibition, one or two days were occupied in collecting and arranging the plants; then one clear day was allowed for the proceedings of the judges; the next day, till 2 o'clock, was occupied in re-arranging the plants after they had been examined by the grand jury, and the prizes had been awarded; and the members, the grand jury (judges), and foreigners were admitted at 2 o'clock on the same day; the following day (Monday) was reserved for the grand jury, and the royal family and suite; then the three following days, the public were admitted without charge. The mode of judging the plants was conducted in the following manner:—The judges, or grand jury, were divided into two sections—the first consisted of 41 persons, and the second of 46; 15 of these were from Paris, 3 from London, 3 from Geneva, some from Germany, and others from Prussia, Holland, &c. &c. The operations, then, of this great combination of wisdom and science, were thus proceeded with:—Each judge was required to examine separately each collection or single specimen, as the case might be, without reference to any consideration or any agreement whatever with any other judge; his decision was written on a card, and thrown into a box or basket, and when each member of the same section had performed the same duty, the ballot or cards were examined, and whichever member had the highest amount of votes, was declared the winner. As the awards were thus determined, they were also announced by the firing of cannon planted in the adjacent grounds. It may be worthy of remark, that certain members and patrons of the Society forwarded for decoration various large plants, which were classed according to some arrangement, and dedicated to the honour of the Society; others to the King, as Chamærops excelsa, and Latania borbonica; others were dedicated to the Queen, as Chamærops Birro, and Phœnix farinifera; and so on, with several other classes of plants presented in homage of worthy objects. The following will convey some idea of the number and quality of the plants exhibited:—

COMPETITION BETWEEN GARDENERS AND AMATEURS IN THE NEIGHBOURHOOD OF GHENT.

Collections of 40 *to* 60 *Plants, in Bloom* (distinguished for their culture and variety).—1st prize to Mr. E. Rosseels, of Louvain, for Pimelia ligustrina, Bignonia cherere, Enkianthus quinqueflorus, Cratægus indica, Pultenæa daphnoides, Tropæolum pentaphyllum, Indigofera rosea, Chorozema varium, Billbergia amœna, Epacris grandiflora, and 19 other miscellaneous plants; Rhododendron arboreum alta-clerense, R. incarnatum, R. Nobleanum, R. triumphans gandavense, R. ponticum, Camellia jap. Cliviana, Colvillii, Donkelaerii, Press' Eclipse, punctata, imbricata, and 6 other varieties; Rosa, 6 varieties; Azalea ind. Smithii, amabilis, elata rubra, phœnicea, and 4 other varieties. *Collections of* 50 *Camellias, in bloom.*—1st prize to Mr. Glym, of Utrecht, for Camellia japonica punctata, King's, elegans Chandlerii, Saccoya nova, Daelenii, splendens, Stephanie, fimbriata, Ferdinandii, Susanna, Traversii, nobilissima, Lefevreana, imbricata, do. alba, alba Loudoniensis, Fraseri, resplendens, Cavendishii, Roi des Pays-bas, maculata, Colvillii spectabilis, maculata, Vandesii, Reevesii, Derbiana, Chandlerii, candidissima, Vandesii vera, Loudoniensis magnif, electa, striata, minuta, punctata major, electa (Casier), Queen Victoria, Gilliesii, Fordii, speciosa, futteng, formosa, Ferleyana, Campbellii, splendens, Thomsoniana, Stephanie, Vandesii superba, delicatissima. *Collections of* 15 *Rhododendron arboreum* (*hybrids*).—1st prize to Mr. Maurice Otin, of Etienne, for Rhod. arb. altaclerense, Russellianum sup., tigrinum, fulgens, superbissimum, delectum, Drummondii (sp. n.), amabile, formosum, sericeum, excelsum, hybridum nov., atrorubens, Smithii, and Knightii.

COMPETITION BETWEEN GARDENERS AND AMATEURS THROUGHOUT FLANDERS.

Collections of 25 *Forced Plants, in bloom.*—1st prize to Mr. A. Van de Woestyne-D'Hane, of Ghent, for Magnolia striata, Glycine sinensis, Kalmia latifolia, K. glauca, Ledum palustre, Pæonia arborea, Lilium Broussartii, and others. *Collections of* 50 *to* 150 *Plants, in bloom.*—1st prize to M. le Cher Heynderycx, of Ghent, Vice-President of the Society, for Dendrobium nobile, Lælia anceps, Maxillaria aromatica, Oncidium Baueri, Trichopilia tortilis, 14 varieties of Rhododendron arboreum, 9 varieties of Acacia, Banksia integrifolia, B. prostrata, B. intermedia, 9 varieties of Azalea indica, 5 varieties of Pæonia arborea, 19 varieties of Camellia, 7 species of Epacris, 20 species and varieties of Amaryllis, Crinum amabile, Clivia nobilis, Begonia coccinea, Ixora Bandhuca, and others, making a collection of upwards of 150 plants. *Collections of* 50 *to* 100 *Camellias, in bloom.*—1st prize to M. Alex. Verschaffelt, of Ghent, for a collection of 50 plants, including the following varieties, which were not included in M. Glym's collection, noticed above:—C. delicatissima, Kew blush, Colvillii, tricolor, rubra aurantia, Grunellii, Woodsii, do. alba, cœlestina, Pressii, alba plena, rubricaulis, Haylockii, Parkerii vera, Philadelphica nova, rosa chinensis, Sweetii, Lechmannii, ochroleuca, Youngii, reticulata, rubra plena, florida, gloriosa, picturata, coronata vera, Rollinii, Hendersonii. *Collection of* 12 *new Camellias, in bloom*, (exhibited in honour of his Majesty the King of the Belgians.)—1st prize to M. Alex. Verschaffelt, of Ghent, for C. Queen Victoria, Prince Albert, Fentonia, Marchioness of Exeter, fasciculata nova, Mathilde, imbricata rosea, alba mutabilis, picta nova, amabilis triumphans, alba plena nova, composita. *Collection of* 30 *Coniferous Plants.*—1st prize to M. Alex. Verschaffelt, of Ghent, for Araucaria imbricata, A. Cunninghamii, A. do. glauca, A. excelsa, A. Brasiliensis, Pinus tenuifolia, excelsa, Gerardi, religiosa, macrocarpa, (abies) Douglasii, Lamberti, longifolia var. (abies), Fraseri, cephalonica (abies), Pinsapo, longifolia glauca, Phyllocladus trichomanoides, Dammara australis, D. orientalis, Dacrydium cupressinum, D. taxifolium, Juniperus pendula, Thuja pendula vera, Cupressus pendula, C. sp. New Zealand, C. australis, Podocarpus Totara, Cedrus Deodara. *Collections of* Rhododendrons, Azaleas, Pæonias, Roses, Amaryllis, Dutch bulbous plants, Orchideæ, Cacti, Ericas and Ferns, with various specimen plants, and minor collections, were exhibited. Among the collections of new plants, which were very extensive, was a most interesting one from Dr. Von Siebold, consisting of plants from Japan and Java.

Rebiews.

Theory and Practice applied to the Cultivation of the Cucumber in the Winter Season, &c. By Thomas Moore. 12mo. Groombridge.

THIS little tract, like Roberts' excellent treatise on the Vine, is what it should be,—not only an explanation of the mode of managing the Cucumber in the winter, but also of the reasons for its management. We welcome its Author as another recruit in the good work of regenerating Horticulture, and of substituting for receipts, which are only to be compared to those in our grandmothers' kitchen-book, something like rational language, fit for the consideration of rational beings. If we could see Mr. Moore's example universally followed by competent persons, Horticulture would quickly receive an impetus which nothing could resist. The plan of a Cucumber-pit, which the Author proposes, although perhaps inferior to the Worsley pit (figured at p. 180), is one which will be found to suit some places better, and is, like it, a wonderful improvement upon the barbarous old contrivances for obtaining heat by fermenting stable-litter.

Dried Specimens of the Agricultural Grasses of Ireland forms a small thin folio volume, which Mr. D. Moore, the Curator of the Royal Dublin Society's Garden, has prepared for the use of farmers. It is not too much to say of this work, that it is one of the most useful things that can be put into the hands of a person interested in rural affairs, and unacquainted with Botany. Its very small price (6*s.*) places it within the reach of everybody. Young Gardeners, too, who are expected to know the common Grasses when they see them, will find it an excellent companion.

GARDEN MEMORANDA.

Lord Wicklow's Seat, Shelton Abbey, in the Vale of Avoca.—At this place is a tree of the Olea paniculata, nearly 40 feet high, a wonder to all the gardeners in the neighbourhood, and probably the only specimen in Great Britain, in the open air.

Sheffield Botanical Gardens.—A large house at this place is appropriated to the cultivation of Ferns, and is one of the most unique structures of the kind in this country. There is a walk near the front, and a flight of steps at each end leading to a gallery. Next the back wall is a platform, on which is placed in pots a collection of Orchidaceæ. The space between the front walk and the gallery is where the Ferns are grown. They grow on a rustic kind of rockwork formed with chumps of wood, rough roots of trees, and large pieces of petrifaction from the Derbyshire hills. The outline of the rockwork is broken into knolls, promontories, and bays in miniature, with pools of water seen in some places through rustic arches covered with those interesting plants. The interstices of the rockwork are filled with a compost of chopped sphagnum, heath-mould, and loam, in which the Ferns appear to delight, as the following dimensions of some of the principal ones will show:—

	long	wide
Pteris longifolia, fronds	3½ ft.	1½ ft.
,, specimens from New Zealand	4½	3
,, Plumieri	4	2
,, arguta	4½	2
,, specimen from New Zealand, a most splendid plant, the entire plant being 8 ft. diameter, 4½ ft. high, with a circular rhizoma; the stems of each frond average 2 ft., and then divide into a quadripinnate frond, 20 fronds forming the entire plant.		
,, nemoralis, 4 ft. diameter	high	wide
Cheilanthes repens, many fine fronds; one measures	9 ft.	7 ft.
Nephrolepis exaltata	5½	
,, tuberosa	3	
Allantodia corcovadensis	5½	
,, nemorosa	4½	2½
Anisogonium Seramporense	5	3
Aspidium coriaceum	3½	2½
Blechnum Braziliense	3	2
,, occidentale	2	4 in.
Doodia, species, New Zealand, fine	2 diam.	

Lomaria Pattersoni, fronds 1 ft. 4 in. long, both barren and fertile fronds ramifying, a circumstance rarely seen.

Gymnogramma, new species, something like dealbata, a most extraordinary plant, diameter of the entire plant, 7 ft.; fronds, 3½ feet high by 1 ft. 4 in. wide.

Gymnogramma ochracea, 4½ ft. diameter, with hundreds of fronds, 2 to 3 ft. high.

Dicksonia antarctica, 3 years' old, fronds 3 ft. high.

Adiantum formosum, 3½ feet high, and many others equally fine.

One part of the collection is very fine. The lofty Cheilanthes in the back ground, Polypodium aureum, with its graceful fronds, overhanging a lofty promontory, on a lower portion of which stands a noble plant of Acrostichum alcicorne, 4½ feet in diameter,

and 3 feet high; whilst the pretty dwarf Niphobolus chinensis creeps round the base, and is in, what is rarely seen, full fructification. The hollows or bays of the rocks are filled with the dwarf species of Adiantum, Aspidium, &c. Altogether, it forms to the lover of these beautiful plants an interesting scene, and is well worthy of a visit to those who delight to study the beauties of the vegetable kingdom.—*T. Appleby.*

Northwood Park, Cowes.—We understand that 8 or 10 Eucalypti trees that were planted in the open air some time ago at Northwood Park, have hitherto passed through the winter very well, and that this season they have done better than usual. We learn that, although they are not more than four years old, from seed, they measure fully 20 feet high.

Miscellaneous.

The Mustard Tree of Scripture.—At a late meeting of the Royal Asiatic Society (the Earl of Auckland in the chair), an interesting paper on this subject was read by Professor Royle. He stated that he had been induced to bring the subject before the Society in consequence of having traced an Indian tree, chiefly by its Asiatic synonyme to be the Mustard-tree of Scripture. Having referred to the passages of the New Testament, Matt. xiii. 31, Mark iv. 32, Luke xiii. 19, &c., where the Mustard-tree and seed are mentioned, he next showed how unsatisfactory were the ordinary explanations respecting the common Mustard plant, and the total want of proof respecting the Phytolacca dodecandra, adduced by Mr. Frost. He then mentioned how his own attention was turned to this subject. Dr. Royle stated that having been asked by the then Principal of King's College, now the Bishop of Lichfield, whether he knew the Mustard-tree of Scripture, and having replied in the negative, he was informed that Mr. Ameuny, a native of Syria, and a student of the College, said he was well acquainted with the tree. Mr. Ameuny confirmed this statement to Dr. R., and added that he had often sat on horseback under the tree, which was, in Syria, considered to be the Mustard-tree of Scripture, and where it was commonly called Khardal. On this Dr. R. observed, "That is the Arabic name for Mustard." Mr. A. replied, "It is so, and in Syria the seeds are employed for the same purposes as Mustard is in Europe." Dr. Royle referred to a variety of sources to obtain some explanation of Khardal as applicable to a tree of Palestine, but was unable to proceed beyond the Asiatic names of three kinds, enumerated in his manuscript Materia Medica of the East. 1, *Khardal*, or common Mustard; 2, *Khardal barree*, or wild Mustard; 3, *Khardal Roomee*, or Turkish Mustard. The last would appear to be the tree, though there was no way of finding what tree is intended by these names in the Arabic works on Materia Medica. On referring to the Index of his "Illustrations of Himalayan Botany," he found the word *Kharjal*, which he was himself surprised to find one of the names of a tree in N. West India, apparently well suited to be the Mustard-tree of Scripture, though he had no proof that it extended into Palestine. This is the Salvadora Persica, first obtained from the Persian Gulf, which is there a tree of moderate size, with drooping branches, and leaves something resembling those of the Olive, with acrid bark, and edible berries. Dr. Roxburgh describes the same tree as common in the Peninsula of India, growing well in every soil, producing flowers and ripe fruit all the year round, with the inflorescence in panicles; the berries red and juicy, much smaller than a grain of black pepper, having a strong aromatic smell, and taste much like garden cresses. Retz had previously obtained the same plant from Tranquebar, and had called it Embelia grossularia. Forskal found it in Arabia, and called it Cissus arborea, stating that it was much esteemed by the Arabs, and even celebrated by their poets. Having traced this tree from India up the Persian and Arabian Gulfs, the author was still unable to find any authority for its being found in Palestine. On inquiry he was informed by Dr. Lindley, that he had seen specimens of the plant collected by Bové, near Mount Sinai. Captains Irby and Mangles, however, in their travels, mention a tree which they suppose to be the Mustard-tree of Scripture, and which Dr. R., even from the few characters given, has no doubt is the same tree, which he had traced from India, up the Persian and Arabian Gulfs, and from thence to Mount Sinai. These travellers mention, that advancing towards Kerak, from the southern extremity of the Dead Sea, they met with a number of curious plants, and among them, one which they observed in great plenty, and which bore a fruit in bunches, resembling in appearance the Currant, with the colour of the Plum. It has a pleasant although strongly aromatic taste, exactly resembling Mustard. We think it probable that this is the tree our Saviour alluded to in the parable of the Mustard-seed, and not the Mustard-plant, which we have in the north, and which, even when growing large, can never be called a tree; "whereas the other is really such, and birds might easily, and actually do, take shelter under its shadow." On further inquiry of Mr. Ameuny, Dr. R. was informed, that the tree called Khardal is found in the neighbourhood of Jerusalem, but most abundantly on the banks of the Jordan, and round the Sea of Tiberias: that is in the very locality where our Saviour appears to have spoken the parable of the Mustard-tree. There can be little doubt but that this is the same tree seen a little further south by Captains Irby and Mangles, and that it is to it that writers in the Talmud refer, under the name of Chardal—one describing a tree of which the wood was sufficient to cover a potter's shed, and another that he was wont to climb into a Chardal-tree in his field, as men climb into a Fig-tree. These statements have been sneered at by Rosenmüller and other Biblical writers. Dr. Royle concluded by stating, that though he thought that Captains Irby and Mangles had been the first to indicate this tree, though without any name, as the Mustard-tree of Scripture, yet he thought that he himself had been the first to ascertain that Salvadora Persica was the tree. But he had been surprised to find in the "Flora Medica" of his friend Dr. Lindley, the observation that this tree is supposed to be the Mustard-tree of Scripture. Having only a day or two previously heard from Dr. L. respecting the source of his information, Dr. R. had as yet been unable to trace it out. He, however, presented his paper as a result at which he had arrived, by an independent mode of investigation, and which is, at all events, interesting, as proving that the name Kharjal is applied even in so remote a country as the north-west of India, to the same plant, which in Syria is called Khardal, proving the impossibility of collusion, or the recent application of the latter name to a plant of Palestine, merely to meet the exigencies of the case. Notwithstanding the absence of authentic specimens, the author stated he felt no doubt that Salvadora Persica is the Mustard-tree of Scripture, as it has a small seed which produces a large tree with numerous branches, in which the birds of the air may and do take shelter; that the seed is possessed of the same properties, and is used for the same purposes as Mustard, and has a name, Khardal, of which Sinopi is the true translation, and which, moreover, grows abundantly on the very shores of the sea of Galilee, where our Saviour addressed to the multitude the parable of the Mustard-tree. [We entirely agree with Dr. Royle in this view of the subject, notwithstanding the objections urged against it by Lambert and Don, which appear to us to have no weight.]

New Work on the Vine.—We learn with much pleasure that a descriptive account of an improved method of planting and managing the roots of Grape Vines is about to be published by Mr. Clement Hoare, whose valuable work on the general management of Vines in the open air is so well known. We understand that the author's intention is to make known a new method of planting and managing Vines, so as to give the gardener as perfect a command of the roots as he now has of the branches.

Robinia Uterhartii.—This tree, obtained from a seed planted by M. Uterhart nearly twelve years ago, has a large thick foliage, and its wood is straight and green. Instead of the branches being crooked in the disorderly way of the Robinia, they grow in tiers of whorls, each season of growth producing its shoot and crown of twigs. It appears to be as vigorous as R. pseud-acacia, if not more so. It has no thorns, and produces beautiful bunches of white flowers. M. Uterhart has propagated it, and can now offer some for sale.—*Rev. Hort., Nov.* 1843.—*T.*

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

In potting stove and other plants, a distinction should be made between the preparation of the composts for permanent woody plants and for those soft-wooded kinds which are annually shaken out of pots. Justicias, Vincas, and some of the Clerodendrons form part of the latter class. After these are done flowering in autumn, they should be close pruned, and left partially dry during winter; in spring the soil should be shaken from their roots, when they are put into small pots to be shifted into larger ones as they advance. The compost for this potting should be made quite fine, in order to let the roots occupy every particle of it in a few months; while the compost for permanent woody plants can hardly be too rough. This distinction ought to be borne in mind at potting-time. A steady heat, not more than 60°, by fire is now essential, as all the plants are in growth; and, except on fine days, little air is necessary at this stage, but keep the atmosphere moist.

Conservatory.—To keep this house now in perfect order, you must go over the plants daily, or at least every other day, and take out such as are beginning to fade. Pick off all dying flowers and leaves, and also distorted flower-buds, or indeed any small or ill arranged flower, which does not look well. Every plant at this season ought to be a gem of its kind, or it is not fit to be brought into the conservatory. Others, however, may be useful for cut flowers to fill glasses, vases, or urns in the drawing rooms. Change the plants in sitting-rooms often, if they are worth preserving afterwards. I give very little air to the conservatory at this season; but for small houses this would not answer so well, and they should have more air, if only to keep down the temperature.

Greenhouse.—Fuchsias represent that class of greenhouse plants which do best to be shaken out of the pots annually; but as the strong varieties of them are gross feeders, you may use a rougher compost for them than is recommended above for stove plants under the same treatment. When potting Heaths, let me urge on you to try the plan of growing them without pots; there is no more trouble or danger in growing the finest Heaths in this way than there is in growing Rhododendron ponticum; and you may remove them from a frame or bed any day in the year, when they are coming into flower, to be brought in doors, or for any other arrangement. Epacrises may be treated in the same way. Both families here are now in the best of health, and many of them are in bloom in the borders of a conservatory wall; others of them, treated as above recommended, give no trouble.

Forcing pits.—Among the many common plants that will force may be placed the old Gazania pavonia and rigens, or Gorteria, as we used to call them in our younger days. Force these exactly as you would Strawberries, and as near the light. Those who force Roses late in spring will now be getting them in for the first time, and must smoke them almost every week. Experiments are now in progress by some of the great Rose-growers, which will settle the question as to whether the Dog-rose or the Boursault make the best stocks for forcing on. Repot cuttings and seedlings as soon as they are ready, and keep up a sweet growing temperature of about 70°, and shade every young thing, if it offers to droop under a strong sun.—*D. B.*

II.—FLOWER-GARDEN AND SHRUBBERIES.

Out-door Department.

The fine weather has come upon us so suddenly, that we appear almost on the verge of summer, before the spring has fairly commenced. All new ground work, such as planting, turfing, &c., must be finished as expeditiously as possible; and as soon as all rubbish has been cleared from the borders, grass, &c., prepare for turning the walk, and making clearer for the season. This, though an operation readily performed, is frequently hurried over and badly executed. A walk, after it has been turned, levelled, and the facing of new gravel laid upon it, should remain in that state three or four days, for the gravel to bleach, and not be rolled until it has had a shower of rain upon it. The utility of this plan is, the gravel becomes washed before it is rolled down, and you have a clean bright walk at all times, instead of one sticking to your feet, and falling into holes in wet weather. This delay causes a little inconvenience while it is about; but it is fully counterbalanced by the excellence of the walks throughout the season.

Reserve Garden.—Birds are very troublesome to newly-germinating seeds, and where it is inconvenient to cover with netting, it will be well to sprinkle the beds with sand made wet with spirits of tar. The transplanting of all autumn-sown annuals should be completed without delay, and also biennials. Prepare a piece of ground for a sowing of the latter, which must be slightly enriched and dug to a good depth.

Shrubberies.—Here the work for the season will be finished except attending to newly-planted shrubs and watering them when necessary. Take care that all newly planted trees are properly staked before they begin to make new roots, and mulch them with short grass occasionally when the lawn is mown.

Pits and Frames.—The bloom of the Hydrangeas, introduced into the forcing-house in January, will now be advancing. If you have any doubt of its being blue, water the plants regularly with water impregnated with alum, to the extent of one ounce to every quart, and keep the plants standing in feeders to prevent the loss of water. The plant may be occasionally sprinkled over head with alum-water. The young plants of this season's propagation will now be fit to pot off. Use the third spit loam from Norwood if you can procure it, which is certain to produce blue flowers. I intend to pot my plants into large 60s, and then plant them into a mass of Norwood loam on a slight hotbed in May. In this way, with a very little trouble, I hope to have unusually fine heads of bloom another season. Brompton Stocks in pots may be planted out, surrounding the wall with rich soil, and spring-flowering ten-week varieties may be left unprotected, so as to prepare them for bedding out about the middle of April.—*W. P. A.*

III.—FLORISTS' FLOWERS.

Auriculas.—These flowers are putting on an improved appearance; still keep them warm at night by mat coverings, and as they are growing fast, they should have a moderate supply of water. I know a very successful Auricula grower, who waters his plants with a decoction of weeds and vegetable refuse, and the luxuriance of his plants is astonishing. *Polyanthuses.*—Last year's seedlings are now throwing up their trusses, and "showing their faces." Those which do not come up to the mark should either be pulled up, or transplanted for border flowers in the shrubbery or elsewhere. *Ranunculuses.*—Seed is now coming up fast; shelter from cutting winds, and if any are rooted out of the soil, which sometimes is the case, they must be carefully re-inserted. Where practicable, the main beds, of named flowers, should be covered with mats, when frost is expected. *Carnations.*—Potting has commenced in many parts of the country, and where the plants have been brought up hardy, the sooner they are out the better; as a precaution, place a slice of Potato between the layers, if two are planted in a pot, so that they may have a chance of avoiding destruction, should a solitary wireworm have escaped you. *Pinks.*—If the directions previously given have been attended to, they will require little else at present. *Pansies.*—The beds may be top dressed with decayed Melon-bed manure, and screened from the prevailing cold wind with Spruce Fir boughs, or other efficient protection. Snails must be trapped, as they begin to be seriously troublesome.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pinery.—Having last week recommended the removal of the tan from the sides of the pots if the heat exceeded 95°, I may now add, that the Pine will bear a bottom heat of 95°, or even 100°, without apparent injury, and may even appear to be doing better with that high degree of bottom heat; but I am satisfied that those plants grown in a bottom heat of from 85° to 90° will be the best by the end of the season. It is strength and compactness in the plants that is so desirable, not only for the sake of appearance, but they are more manageable, and produce finer fruit. Suckers in small pots will require watering often when they begin to root freely; admit air daily, if only for half an hour.

Vinery.—Vines started in October will now be changing colour, and should not be syringed; give air daily, excepting during cold, windy weather. The atmosphere should now be drier, to give flavour to the fruit. Continue to stop the laterals till the fruit is quite done swelling, after which they may be allowed to grow at freedom. In the second house the shoulders of some of the branches may require supporting. Vines lately introduced into houses where the temperature has to be kept high for Pines or other plants, will require much attention to induce all the buds to break. Bend them most, just above those buds which are least prominent. Syringe them often, and that this may be done more effectually, keep them along the front of the house, till all the buds have broken.

Peach house.—On trees started in the latter end of November, the fruit will now be showing; and during this process the temperature should be kept very regularly at 55° or 60° by night. Tie in the young shoots often, and continue to stop over strong growths, in order to keep all parts of the tree in an equal state of vigour. If syringing fails to keep down insects, have immediate recourse to fumigating. The late house need have no fire, unless the thermometer fall below 45°.

Fig-house.—Fig-trees on which the fruit is now ripening will require moderate waterings, on account of the second crop now appearing. Till the first crop is gathered, keep down insects by means of sulphur.

Strawberries.—Bring in another succession of plants according to the demand; let the plants have plenty of air till the fruit is set. Water with liquid manure till the fruit begins to ripen, after which use clean soft water.

Melons.—Those plants put out in February will now require attention to training, watering, and adding fresh soil as the roots appear through the ridges or hills. Give air as early as possible, shutting up with 90° of sun heat. Renew the lining of dung-beds frequently, to prevent any check to the plants; doing the back and front alternately.—*G. F.*

V.—HARDY FRUIT AND KITCHEN GARDEN.

Finish planting all sorts of fruit-trees as soon as possible. If deferred later they will suffer greatly, especially if brought from a distance. In such a case the trees, as soon as raised, should have their roots passed through a puddle of loam and water; otherwise the best fibres are dried up before they are inclosed in the package. If nurserymen would see to this, and seedsmen could be brought to act upon the excellent advice of Mr. Forsyth, there would be fewer disappointments.—*Sea Kale* may now be obtained plentifully with little trouble. Where it is wanted early in November, a fresh plantation should be made about this time every year. The ground should be well manured, and deeply trenched. If a stiff clay, add leaf-mould, chalk, sand, or gravel. Sow in patches, or rather use one-year old plants, which will be strong for forcing next season.—*Rhubarb.*—Where this is greatly in demand, prepare the ground as above; divide and plant out old roots; or sow seeds under protection to be planted out in a good situation, encouraged during summer, and lifted for forcing next winter.—*Asparagus.*—A trench may be cut by the sides of a bed in the open ground, and filled with fermenting matter, to forward some to succeed those in frames. It is a good plan to have several beds surrounded with pigeon-holed walls for this purpose, provided with wooden covers. The same remark will apply to Rhubarb and Sea Kale). Sprinkle all the beds with a little salt repeating the operation at intervals. Stimulants and

manures are most useful in the growing season, when, too often, Asparagus is left to shift for itself.—*R. F.* [In last Calendar, p. 184, 12th line from top—read, "sprung ones," instead of "spring ones."]

VI.—ARBORICULTURE.

Old Woods.—Be careful to go through these before the trees, shrubs, &c. get into leaf, and relieve any young plants that have been kept down, forced to one side, or otherwise injured. Cut away all or a part of whatever injures them, as recommended in former Calendars, and take off any rotten or broken branches.

Coppice.—Great attention should be paid to clearing them of all the saleable and useful produce, as well as of the useless spray from the stools, before the young shoots appear, as they are easily broken off.

Young Plantations.—Continue to forward all the works that are necessary at this season, until they are completed. In recently planted ones now is the best time to hoe among the young plants, in order to clear away all weeds, Grass, &c., before such get firm hold in the ground. It is of the greatest advantage that the first buds and shoots should have a fair start; and it saves much labour to clear away the weeds now, as the ground is in a loose state after the frost.

Hedgerows.—Attend to former instructions before the season is too far advanced.

Nursery Work.—The weather still continues unfavourable for many kinds of work that should now be done, but it must be put off until circumstances will admit of its being performed with propriety. The hoeing, weeding, and cleaning of last year's seed-beds, and nursery rows of young plants, &c., should be commenced and finished as soon as possible.—*W. B.*

State of the Weather at Chiswick during the last 18 years, for the ensuing Week ending April 6, 1844.

Mar.	Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp	No. of Years in which it Rained.	Greatest quantity of Rain.	Prevailing Winds. N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.

March 22d Overcast; cloudy; slight rain at night
23d Overcast; fine; clear and frosty at night
24th Cloudy; boisterous, with rain in forenoon; overcast
25th Overcast; rain; fine
26th Very fine throughout
27th Lightly overcast; fine; hazy and mild
28th Fine; very fine, with bright sun; clear and fine at night
Mean temperature of the week, 3 deg. above the average.

Notices to Correspondents.

BOILERS.—*K. L.*—The brick sides to the furnace will most likely cause the fuel to burn better and to keep alight longer, than when the sides consist of the boiler itself. Lowering the position of the fire will not produce any ill effect if there is sufficient thickness of brickwork on each side to prevent the heat from escaping through it. By thus lowering the furnace, you can doubtless increase the area of your fire-bars as much as you please, and the heat will act more powerfully and directly upon the boiler. We shall be glad to hear the result of the change, if you make it.—*A.*

CALCEOLARIAS.—*A Subscriber, Manchester.*—Standishii, Barnes' Landmark, Green's Alba coccinea maxima, Miss Antrobus, Prince Albert, Isabella.*

CAMELLIAS.—*Short.*—A small portion of well-decayed cowdung may be advantageously mixed with the soil for Camellias.‡

DRY-ROT.—*Isle of Wight*—How to destroy this formidable enemy, when it has once attacked timber, no one knows. Your only remedy is, to take out all the infected wood-work, and *burn* it; for thus you will kill the fungus that produces the evil, and all its seeds. Before replacing the timber, you should also rake out all the old mortar that touched it. The new timber should be rendered dry-rot proof by some of the means now patented, such as Sir Wm. Burnett's chloride of zinc, or Mr. Bethell's creosote, or Payne's lime and silicate of potash. Any unprepared timber will probably be again attacked, notwithstanding all the precautions you can take. Be thankful if it does not spread all over the lower part of your house, or even mount to the roof.

FIGS.—*Z.*—Figs are liable to drop their fruit from various causes; but chiefly from their being badly conditioned as regards temperature and water. If the fruit-buds have advanced into the form of young Figs, and then for want of sufficient temperature are allowed to remain stationary for a time, they are apt to drop in consequence, even although a proper heat is afterwards afforded. But supposing a due temperature to be all along maintained, if the juices of the plant have become greatly inspissated from the want of a regular supply of water in sufficient quantity, the young fruits become tough like so many pieces of India rubber. ‖

FRUIT-TREES.—*Strath Isla.*—If you graft your wall-trees which you have cut in with some of the new varieties of Pears, recommended in some recent Numbers of this Paper, you will find they will bear abundantly. Cuttings of Apple trees will no doubt strike by inserting them in a Potato; so they will by inserting them in the soil. Potatoes contain a large proportion of water; and the principal elements of all vegetables likewise enter into their composition. But when decomposition takes place, there is then nothing to hinder these elements from becoming subservient to the vegetating powers of the Apple-tree. ‖—*Anglus.*—You will obtain a supply of fruit much sooner from dwarf than you will from standard trees. There can be no doubt that where the Ribston Pippin does well, many culinary varieties of Apples will succeed as dwarfs. You may plant Dumelow's Seedling, Bedfordshire Foundling, Alfriston, Hawthornden, Royal Russet, Round Winter Nonsuch, and Mère de Ménage. ‖

FUCHSIAS.—*M. W. K.*—Cut them down at once; take care that they have plenty of pot-room, and are thoroughly drained; top-dress them with charcoal-refuse steeped in some sort of liquid manure. They will make beautiful plants.—*A Subscriber, Manchester.*—F. Exoniensis, Formosa elegans, Standish's Colossus, Conspicua arborea, splendens, and Epps' Kentish Bride.*—*I. M.*—From your description of the properties you require, the following six varieties will most probably suit you:—Epps' Winserii, Prince of Wales, Standish's Colossus, Candidate and President, and Robusta. Strike a cutting of Corymbiflora after it has formed its buds.*—*W. J.* Venus Victrix.*

GLADIOLI.—*A Subscriber.*—Seeds of the hardy kinds may be sown in the American border, in the second week in April. Whenever the weather is dry, the young plants should be plentifully watered to promote their growth. At the beginning of October, or as soon as the leaves wither, the young bulbs should be taken up and dried; they may be re-planted again at any time, placing them about eight inches under the ground to prevent the frost reaching them, for very severe frosts will destroy them if they are near the surface. The seedlings, if well encouraged, may be expected to flower next year. If the peat is close and rich, it should be mixed with sand, to prevent its cankering them, or causing them to rot by the retention of too much wet in the winter.‡

GRASS-SEEDS.—*Subscriber.*—For permanent pasture, Mr. Lawson, recommends the following:—Anthoxanthum odoratum, 1 lb.; Dactylis glomerata, 5 lbs.; Festuca duriuscula, 1 lb.; F. elatior, 1 lb.; Lolium italicum, 4 lbs.; L. perenne, 5 lbs.; Milium effusum, 1 lb.; Phleum pratense, 1 lb.; Poa nemoralis, 1 lb.; P. sempervirens, 2 lbs.; P. trivialis, 1 lb.; Lotus major, 1 lb.; Trifolium pratense perenne, 2 lbs.; and T. repens, 3 lbs. A plan of a Piggery is given at p. 44 of this year.‡

HOLLIES.—*D. R.*—Holly-seed three years old is not worth sowing when fresh seed can be so easily had. To form a hedge you may either sow it or plant it. A light loamy rich soil is what the Holly likes best.

INSECTS.—*Anon.*—Keep off green-fly with weak gas-water (see p. 697, 1843). Do not use train oil, which can do no good, and certainly does harm.—*Anne.*—After the most diligent search amongst the Moss we could find no living animal—the box having been crushed it had made its escape; we therefore hope to be favoured with another specimen, better secured. *R.*—*A B.*—Cannot you cover your Peach-trees, one at a time, with a thick mat or carpet, fixing it close over the top of the wall and letting it touch the earth at the bottom? By introducing the spout of the fumigating bellows as low down as possible, after being well charged with tobacco-smoke, we are convinced you might get rid of the aphides. The best period will be as soon as you detect them, which you must do by examining the under sides of the young leaves *daily*. Be so good as to send us some infested leaves, and say, as the spring advances, how you have succeeded with the operation, if you can adopt our plan. *R.*—*S. H.*—After the most attentive examination of your Camellia-leaves, I cannot discover a single insect; nevertheless, a few of them seem to have been pierced sometime since by the little Thrips. I regret not being able to assist you in remedying the evil, for the little exotic insect called Thrips can sustain a very great amount of heat. Probably cutting off the leaves most affected will prevent the spreading of the disease. *R.*—*J. W.?* of Down, transmitted three pupæ of some fly, saying he failed in procuring more specimens, and desired to know the name, which we cannot ascertain until the insects hatch. We shall feel obliged by his communicating their history, for we know not to what he refers.—*R.*

LAWNS.—*X. Y. Z.*—We said nothing about diluting the gas-water; because we have over and over again stated that it must be lowered by water: with how much we cannot tell, because the gas-water varies in strength. Four of water to one of gas-water will probably do; the stronger, however, the better, if not too strong. It will scorch your grass, but that does not signify; the lawn will soon recover. But from what you say, we should fear that your case is hopeless without thorough drainage, and perhaps burning the upper spit.

MANURES.—*Tyro.*—We can but repeat that as far as we have seen it tried, Potter's guano is a most useful substance; but we have not seen its effects on Onions. It is used at the rate of 3 or 4 cwt. per acre. We would also advise you to try on your Onions the following mixture:—One peck of salt, two pecks of soot, well mixed and left for a few days; then applied as a top-dressing, or lightly forked in. We *hear* of great effects thus produced on the Onion crop.—*Inexperience.*—Both lime, soot, and wood-ashes can be used advantageously in a stiff, clayey garden, especially the two first; but none of them will prove of much service unless the ground is thoroughly drained. On such land farm-yard manure is almost indispensable until it is in a state of perfect tilth, and then it may be dispensed with if other fertilising materials are employed. You will never get good Carrots on heavy land; all such long-rooted plants prefer a deep, light, rich soil.

MIGNONETTE.—557.—If you cannot please your wife how can we hope to be so happy? If we were you, however, we should see whether slate Mignonette boxes of rich soil, exposed to the full sun, and carefully watered, would not satisfy the gentle dame's expectations. We presume that your plants die off in summer; but you are very chary of explanation.

NAMES OF PLANTS.—*R. G.*—A Dendrobium, which we do not recognise.—*J. M.*—Gnidia simplex.—*A Reader.*—Erica persoluta alba.—*A.*—Dillwynia cinerascens.‡—*J. L L.*—1, Asterotrichion sidoides; 2, Erica Bowieana; 3, Euphorbia melanthera, Phascum alternifolium.§—*W. Gardner.*—Hypnum ruscifolium. That the filaments which inclose the granules of Equisetum fluviatile are elastic, is known to all who have studied the genus.§—*A Subscriber.*—Burchellia capensis.‡—*Anon.*—Hypnum ruscifolium.§

NAMES OF FRUITS.—*C. C.*—Pears: 1, Beurré Rance; 2, Winter Bon Chrétien. Apples: 3, Cockle Pippin; 4, 11, probably Alfriston; 6, Court of Wick; 12, Pearson's Plate; 13, Green Balsam; 14, Cockpit; 16, Norfolk Beaufin; 17, Kentish Fillbasket; 18, Easter Pippin, or French Crab; 20, Yorkshire Greening; 21, Winter Pearmain.‖—*A. Z.*—1, Chaumontel Pear. Apples: 1, Royal Russet; 2, Blenheim Pippin; 4, Bedfordshire Foundling; 5, Brabant Belle Fleur; 6, Alfriston; 7, London Pippin.‖—*W. H.*—Dumelow's Seedling; 2, Æsopus Spitzenberg.‖—*Este.*—Your Seedling Apple has become rather mealy; it, however, appears worthy of further trial. ‖

ORANGES.—*M. C. Y.*—One kind will train as well as another, except the dwarf, small-leaved kinds. Neither is there much to say about their appearance as standards, except that the true Oranges form a better foliage than Citrons and Shaddocks; at least that is our taste. No good eatable fruit will be had without plenty of warmth; if properly treated the Malta and common Sweet Orange are as valuable as any. The back of a greenhouse is a bad place for plants. You may, however, grow on it scarlet Pelargoniums, the Cape Plumbago, and Passionflowers, or Cobœa scandens. To the names of shrubs which we have repeatedly given we have really nothing to add. Any of the crimson Callistemons, some of the smaller Acacias, Camellias, and Chorozema varium are almost indispensable to a nice collection.—*Dublin.*—These require a very rich soil. A mixture of turfy rich loam, thoroughly decayed manure, and leaf-mould, in the proportion of two-thirds of the former to one-sixth of each of the latter, is suitable for them. Pelargoniums also like a light rich soil.‡

PANSIES.—*Y. N.*—Brown's Curion, Pearson's Black Prince, Cook's Mulberry Superb, King's Sulphurea elegans, Major's Bridegroom, Thompson's Eclipse.*

PETUNIAS.—*E. B.*—Petunia punctata, Magniflora, Lady Peel.*

PEACHES AND NECTARINES.—*A Lady Subscriber.*—In order to prevent your Peaches and Nectarines from splitting before they begin to ripen, it is necessary that the border should not be allowed at any time to become too dry; and further, that too much foliage should not be taken off at once; neither should insects be allowed to injure that which is left. If the trees are thus kept in health in dry weather, the fruit will not be affected as you describe when wet sets in. In watering, cold spring water must not be used.

PEAR-TREES.—*A Subscriber.*—It is too late in the season for root-pruning; besides, as your two Pear-trees blossom abundantly, it does not appear that they require that operation. A dressing of fresh soil and manure, applied as far as their roots extend, will prove beneficial ‖

POLYANTHUSES—*An Amateur.*—Buck's George 4th, Pearson's Alexander, Clegg's Earl Grey, Hufton's Squire Ray, and Lord Rancliffe, Crownshaw's Invincible. Begin to use the liquid manure as the buds begin to swell, about once in a fortnight. take care to keep it from the foliage.*

PELARGONIUMS—*A Subscriber, Manchester.*—Matilda, Witch, Queen of the Fairies, Sir R. Peel, Grand Duke, Lyne's Duke of Cornwall, Rising Sun, Erectum, Nestor, Rhoda, Favourite, Armynta.*—*W. Heath.*—All the flowers in your list we have seen, and recommend you the above 12. *

RHODODENDRONS.—*J. M.*—See p. 88 of this year; for a list of Ornamental Shrubs, see p. 149, 1843.‡

ROSES.—*Amateur.*—Your stocks are covered with young germinating Mosses. They do no harm, but they show that your ground or your air are too wet, and not well ventilated, which should be cured.—*J. B.*—That your China Roses may bloom late, they should be left unpruned until they show their blossom-buds. When these begin to appear you may then prune them as you would do at an earlier season. It is not, however, advisable to leave all the plants to be pruned thus late, as they bloom but sparingly. If some of them are cut in about a fortnight hence, they will flower earlier and much more freely, and the others will come in in succession.‡—*J. M.*—Superphosphate of lime, or Potter's guano, is better for Roses than the substance you mention, of which we have not a good opinion. They may be applied at the rate of a wine-glassful to a 24-sized pot. We are not acquainted with the Rose "Beauty of the Prairies."‡

SCARLET GERANIUMS.—*E. B.*—Compacta, Brighton Hero, Frogmore Scarlet, Waterloo, Smith's Emperor, Green's Seedling.*

SEAKALE.—*Guichenet.*—It likes good rich well trenched ground; it will succeed quite well in the situation you mention.‡

TAN.—*H. P.*—Tan will keep up a good bottom-heat for a considerable time. It should be used in a moist state, as if it is too dry it will not ferment. When the heat begins to decline the tan should be forked up and mixed with a little fresh material, in order to raise the heat again.‡

TRINIDAD PINES.—*A Subscriber* will find this, and I dare say in perfection, at Cunliffe Lister Kaye's, Esq., Manningham House, near Bradford. I had a small root-sucker from there upwards of three years ago, which fruited with me, but only produced a deformed fruit, from water having accidentally dropped in the heart of the plant in winter. It produced five gills and crown, which are promising plants, but not fruiting here until next year. Mr. Kaye told me himself it was the true Trinidad or Pitch-Lake Pine.—*James Roberts, Ashton Hall.*

WORN-OUT GARDENS.—*Subscriber.*—Can't you get cow-dung? If not, you may employ guano; and as the soil is entirely worn out, it will be better to do so at different periods of the year—say ½ cwt. before cropping, to be thoroughly incorporated with the soil, and then left for a week or two till rains have mixed it; more afterwards, when the crops are up and growing; give them frequent small doses in a liquid form, not over the leaves but between the rows. Mind that your guano is of good quality; a great deal of rubbish is in the market.

VINES.—*Guichenet.*—Inarching may be performed at any time after the Vines have started so far as not to bleed.‡

MISCELLANEOUS.—*Clouden.*—We have been paying 10*d.* per bushel for refuse charcoal; but it is much too dear. We know nothing about faggots. A Hatch load of English bark weighs 45 cwt. Foreign is always sold by the ton. 2 ton 5 cwt. being an English load, therefore if Foreign bark sells at 7*s.* 4*d.* per cwt., English will be 16*l.* 10*s.* per load, and so on. There are many ways of selling bark. In the rough, 50 ells make a load. A Hatch-load of Oak bark is, the bark stripped from the timber, as felled in April and May, set up to dry in the open air, put under cover, and "hatched"—that is, the moss and outside rough bark are shaved off, and it is chopped into pieces from 2 to 3 in. long; it is then ready to go through the mill in the tan-yard.—*Anon.*—If your Pear-trees bloom and do not fruit you must protect the blossoms.—*B. F.*—Chimonanthus may be propagated from cuttings of the just ripe wood struck in heat under a bell-glass; it is now commonly raised from layers, which, however, root unwillingly; the best way is to get the seeds, which are always found on old plants after a mild winter. It is not particular about soil.—*Farnham.*—Cuttings of the roots of Glycine sinensis may be struck in a little heat; it will also root freely from layers.—*W. F.*—If a lady cannot buy the seeds she wants, there is nothing to be done but to save them herself. No instructions are required, as they will be saved in the usual way. In sending them to New Zealand they must be packed loosely in a coarse canvas bag, which must be suspended in some well ventilated part of the ship. All European seeds are useful in New Zealand.—*Boulogne.*—There is no objection to a south-east aspect for a small greenhouse. Many plants will thrive very well in it.—*M. C. M.*—Next week; the question is referred to one conversant practically with such questions.—*Argo.*—The cause of the young bulbs of Orchidaceous plants damping, is no doubt owing to their being kept too wet. The suckers may be taken from Musa Cavendishii before it fruits.‡—*Exhibitor* is answered at p. 104 of this year.‡—*P.*—See last vol., pp. 303 and 335, where a full account of the method of burning clay is given, and also at p. 85 of the present year.‡—*Amicus.*—Currants will bear grafting very well.‡—*A Beginner.*—Calico done over with Whitney's composition dries in a few days; the Beechwood is a better Melon than the Green Rock; the plants should be turned out of their pots and planted into the mould in the bed.‡—*B. D.*—The management of "Couve Tronchuda" is given at p. 120 of this year.‡—*D. G.*—A list of herbaceous plants may be found at p. 681, 1843.‡—*Rambler.*—We do not know it. Walcheren Brocoli is like a good large Cauliflower. It is reported to be hardy, and requires the same treatment as other varieties.‡—*W. J.*—A Pansy for showing should not be less than 1¼ inch across.*—*W. J.*, and *W. J. and Co.*—Flowers may be sent packed in tin cases with moist moss.*—*W. J.*—Shape and habit of male, and colour of female, and colour of male parent.*—*W. J.*—The "Florists' Journal."*—*A. R. Z.*—See p. 197, in to-day's Paper.‡

SEEDLING FLORISTS' FLOWERS.

AZALEAS.—*C. M.*—Your seedling presents no improvement either in colour or form, and the petals in the centre are a decided defect.*

CINERARIAS.—*Winton.*—Your seedling is a bold and showy variety of good colour in the specimens received; the edges of the petals curl back, which make them look narrow and irregular; if this fault is not apparent on the growing plant, it is a handsome flower.*—*T. B. Y.*—No. 2 is a flower of good form and substance; the colour with which the petals are tipped, is rather too faint, which gives it a faded appearance, but from its other good properties it makes a desirable variety.*—*E. J. L.*—Rookwood is not worth preserving, on account of its colour being weak, and the petals thin and small.*—Alice is a very good flower in colour, form, and substance, but there are others in cultivation similar to it.*—*Z. Z. Z.*—Formosa elegans, a very lively-looking variety, surpassed by one similar to it in appearance, already in cultivation, named the Dowager Queen. Rotunda, compact and pretty flower, but no improvement, and we have similar varieties to Venus Victrix and Rosea alba, which are both pretty, compact varieties.—*A. B.*—A large and very finely-coloured seedling, of an azure tint; the petals appear rather too long for their substance, as they hang about rather too much; no doubt part of this irregularity arises from the faintness produced by travelling. We are glad to see these splendid colours gradually getting into larger flowers; this specimen measures 1¾ inch in diameter.*

FUCHSIAS.—*Z. Z. Z.*—Alba coccinea. We have the same delicate colours in larger, stouter, and better flowers.*

*** As usual, many communications have been received too late.

IMPORTANT TO AGRICULTURISTS AND OTHERS.
ANALYSES OF SOILS, MANURES, &c., are conducted by Mr. MITCHELL, Analytical Chemist (late of the Royal Polytechnic Institution), No. 5, Victoria Cottages, Hawley Road, Kentish Town.
A vacancy now occurs for one house or outdoor Pupil, for the study of Chemistry as applied to Agriculture. Apply as above.

FARMERS' CLUBS.

April 1 . { Yoxford. / Wenlock. / W. Firle.
April 2 . { Framlingham. / Rayleigh.
April 3 . Harleston.
April 6 . Collumpton.
April 8 . { West Hereford. / W. Market.

We have received from a correspondent who signs himself "Alpha," the following interesting communication, commenting upon our remarks in a late Number of the *Gazette*, on the filthy state of the Water in Horseponds :—

"Though I admit the impropriety of allowing the drainage of the yards, or urine from cow-houses and stables, to get into the ponds from which water is supplied to horses and cattle, as demonstrated in your leading article of the 9th inst., yet in establishing the principle thus laid down, an important circumstance seems to have been overlooked. The practice so justly reprobated in that article is impolitic, not only as rendering impure and unwholesome the beverage of the domestic animals, which it is especially important to guard against, but also as allowing this to be done through the agency of matters which are in themselves of great value when properly managed. The conclusion, then, arrived at—that 'there is no case in which food of an organic character in a condition of usefulness for vegetables can be safely administered to animals,' must, we fear, be taken with some grains of allowance. It is well known that the putrefactive process must have proceeded a certain length before animal matters can be rendered available as food for plants; but the circumstance was overlooked by the writer, that a certain class of animals are almost entirely supported by food which is partially and often to a great extent decomposed. That such is a wholesome article of diet I do not mean to assert, yet that it is *decidedly poisonous* is controverted by the circumstance of its being so extensively used. Animal matters constitute the food of the class of animals to which reference is now made, and it may be said the case of such is not analogous to herbivorous animals, which are those referred to in the article in question. With certain exceptions, however, all animal matters are affected by the same laws, and the cases are rare indeed in which any substance proving decidedly poisonous to one class can be partaken of with impunity by another. Instances are not uncommon in which even herbivorous animals have been trained to partake freely of animal food; and although such in a decomposing state might be more injurious to them than to carnivorous animals, yet it does not by any means follow that it would be poisonous. No doubt 'a little leaven added to a batch of dough will spread, and the whole lump acquire the condition of the small quantity added to it,' but the inference drawn from this circumstance, 'that a small quantity of matter, if in a decomposing state, whose elements may be identical with those of a living animal, may yet prove the cause of its death if it be partaken of,' cannot, as it appears to me, be established. The *practice* which the article referred to condemns, is unquestionably deserving of the most severe censure, but the *principle* sought to be established appears to have been too hastily adopted."

We take advantage of this opportunity for recurring to this subject, to direct the attention of our readers to a case bearing directly upon it—a statement of which occurs in the 89th page of Dr. Pereira's work on "Diet." Dr. Pereira writes as follows:—

"At the Nottingham Assizes in July 1836, it was proved at a trial on which I was a witness, that dysentery in an aggravated form was caused in cattle by the use of water contaminated with putrescent vegetable matter, produced by the refuse of a starch manufactory. The fish (perch, gudgeon, pike, roach, and dace), and frogs in the pond through which the brook ran were destroyed. All the animals (cows, calves, horses) which drank of this water became seriously ill, and in 3 years the plaintiff lost 24 cows and 9 calves, all of a disease (dysentery) accompanied by nearly the same symptoms. It was also shown that the animals sometimes refused to drink the water; that the mortality was in proportion to the quantity of starch made at different times, and that subsequently when the putrescent matter was not allowed to pass into the brook . . . . the fish and frogs began to return, and the mortality ceased among the cattle. The symptoms of illness in cows were as follows: — the animals at first got thin, had a rough staring coat, and gave less milk (from two to three quarts less every day); they then became purged, passed blood with the fæces, and at length died emaciated and exhausted. On a *post mortem* examination the intestinal canal throughout its whole length was found inflamed and ulcerated."

Now, here we have proof to the great loss of their owner—proof that cattle (horses, oxen, &c.) are liable to disease and death, from drinking water containing putrescent matter. It must be admitted, from the circumstance mentioned by "Alpha" above, that the proposition of organic matter in a decomposing state being poisonous to animals, is not universally true; the vulture among birds, and many other animals, live almost wholly on carrion and half-rotten animal matters; but, believing this proposition to be true, so far as the farmer is concerned in the matter, and that the putrid state in which many horse-ponds are to be seen is not only disgraceful but dangerous, we were glad to meet with the above passage so entirely corroborating this opinion.

SALT AS A MANURE.

Owing to Mr. Edward Solly's valuable observations on this subject in our Paper of last week, having by an oversight been printed without the author's corrections, we are under the necessity of reprinting two of the paragraphs:—

"When concentrated solutions of common salt and common carbonate of ammonia are mixed at low temperatures, they decompose each other to a considerable extent, and a quantity of bi carbonate of soda and muriate of ammonia is formed, whilst a portion of ammonia is set free. The bi carbonate of soda being almost insoluble in the solution of muriate of ammonia, may be separated and obtained pure, whilst the muriate of ammonia may be obtained by evaporating the solution and separating it from undecomposed common salt, and free ammonia. But if, in place of separating the two substances, a quantity of water is added, the bi-carbonate of soda dissolves, and the two salts redecompose each other, common salt and carbonate of ammonia being again formed. In the same way, if solutions of carbonate or bi-carbonate of soda be mixed with solution of muriate of ammonia, they mutually decompose each other, and form carbonate of ammonia and common salt.

"It is perfectly true that very strong solutions of bi-carbonate of ammonia and common salt decompose each other, and that common carbonate of ammonia decomposes solution of salt, when carbonic acid is passed through it; but it is equally true that this only holds good when the solutions are concentrated, depending, as it does, on the insolubility of the bi-carbonate of soda, in the solution of muriate of ammonia; if dilute, no such change takes place. When salt is employed as manure it is exposed to the action of a very dilute solution of carbonate of ammonia, for dew and rain-water contain a minute quantity of that salt; under these circumstances it is not to be expected that the salt will be decomposed; for it is not reasonable to compare what takes place in strong solutions in close vessels, with what occurs in the open air with abundance of water. We can only compare the action of rain-water on salt, to the action of very dilute solutions of salt and carbonate of ammonia, and such solutions do not decompose each other. Although chemical facts are certainly against the decomposition of salt by carbonate of ammonia, or the fixation of ammonia by common salt, yet this in no way diminishes the value of salt applied as manure."

There are also the following errata:—

Line 27, from the bottom, *after* nia omit the comma.
" 14 " *for* in organic *read* inorganic.
" 4 " *for* process *read* forces.
" 3 " *after* and *insert* of.

FARM BAILIFFS.

The national importance of the Commission now acting in Ireland, under the presidency of the Earl of Devon, to inquire into and report upon the relative positions of landlord and tenant, has naturally attracted my attention, and I entertain sanguine expectations that much practical benefit will result to the country in consequence of its investigations. That there is great need of improvement in the social and Agricultural state of Ireland is indisputable; but the question is, By what means the objects sought will be most easily attained? I do not presume to meddle with the political part of the subject, but I may hazard a few observations respecting the Agricultural bearings of the matter. That a considerable impulse will be given to the development of the resources of the country in different ways, I have sanguine expectations; that good landlords will be led to persevere in their humane and rational efforts to ameliorate both the moral and physical condition of their humbler tenantry, and to promote those Agricultural improvements which common sense must show to be conducive also to their own advantage, I fervently hope; and that many bad landlords may be compelled, from the shame of exposure, or the stringency of legislative enactment, to be just, if not generous, to the occupiers of their land, and stimulated to some laudable exertions, through the awakening interest on the subject, I also anticipate. The machinery of our National Agricultural Society, with its numerous auxiliary branches, may be worked with effective power, in combination with other forces, and model schools and farms will contribute in their respective departments. But one of the chief wants—assuming that an extended system of draining, subsoil-ploughing, and spade-trenching, &c., were set in motion—would be that of a sufficiency of intelligent, well-informed, and hard-working Bailiffs, or Stewards, as my countrymen choose to call these dignitaries.

Now, there is a vast difference in England between the sporting-looking bailiff, dressed in a knowing kind of shooting-jacket, mounted on his smart cob, and enjoying a snug salary of from one to two hundred a year, and the plain working bailiff, who in return for his weekly wages of from 12*s*. to 18*s*. a week, and perhaps some extra perquisites of milk, or the keep of a pig and poultry, is thankfully content to take his share in the daily operations of the farm; who, from his own manual acquaintance with the plough and the spade, can not only set a job to a labourer, but can and will show him how to execute it in the neatest and best manner; a man, in short, who considers that his hands, as well as his head, ought to be engaged in the service of his employer. The introduction into Ireland, from time to time, by the land proprietary of first-rate bailiffs from England and Scotland, has been the means of establishing, on numerous demesnes and estates, a highly improved system of Agriculture; and among those bailiffs many admirable men have been found, to whom our country is much indebted for the information they have communicated, and the practice they have exhibited for the imitation of the higher order of our farmers; but since the great majority of Irish landlords and farmers, living by husbandry, cannot afford to pay high salaries, with *et ceteras*, they must either personally superintend their farm-labours (if they know how to do so effectively), or in most instances be content to employ the common working bailiff, whose wages do not greatly exceed those of the labourer.

In referring to the extreme classes of bailiffs, I have passed over some intermediate varieties—very good ones, too—in which efficient and trustworthy men are to be found, who are content with salaries far lower than the maximum point, yet considerably above the wages of the labourer; because the essence of the observations which I would make, is confined (in my own mind, at least), to the humblest description of bailiffs, which I believe to be the most useful, yet the least easily obtainable in Ireland. If men of this low class were a little elevated in their grade of life, and a good deal advanced in acquirements and skill, we have the description of persons critically suited to our ordinary circumstances. A humble person, who is honest, will be more cautious in the first place in the expenditure of his employer's money, more alive to profit, and therefore less disposed to speculative operations than a more consequential sort of personage; and from his personal association with the workmen whom he leads, he will be more likely to acquire their confidence than one much elevated above them; and without a cordial feeling between the confidential manager and the labourer, (I admit, however, that this very confidence may operate very unfavourably, without a sufficient distinction between them) there is danger of those acts of atrocious outrage which so often paralyse the most promising efforts of the patriotic and good of all parties.

But it is difficult to provide in Ireland such a supply of practical and inexpensive native superintendents, as an improved and extended state of her Agriculture may require. I have used the expression native, for, while I most readily acknowledge the superior skill of the imported British bailiff, a feeling of jealousy unfortunately exists, more or less among Irish labourers, against any stranger who may be placed over them. The alterations and improvements which our modes of cultivation so generally call for, would, when suggested and applied by Irish heads and Irish hands, be received and adopted with a cordial interest in their success, instead of being obstructed by that sentiment of distrust which would be entertained to a considerable degree towards what would be designated the innovations of a foreigner. If, then, we hope to effect any great change with an uneducated class of land occupiers, we must begin with soothing their prejudices before we appeal to their reasoning faculties—of which no people possess a greater natural share than my countrymen; but we all know how constantly, even in the most intellectual classes of society, the truth of the old adage is illustrated—

"A man convinced against his will,
Is of the same opinion still."

Now, the difficulty in Ireland—where farming is so defective—is to find the nurseries in which young men can be sufficiently trained, even in practical matters alone. In England there are excellent bailiffs, of every rank to be obtained, from that of the gentleman bailiff (all these matters are relative), who has been highly educated in his profession, to the working manager, who acts in obedience to the orders of the experienced farmer, who knows no superior, and requires no instructor. In Scotland the great farmers, who are their own head bailiffs, could find among some of their hinds, men competent, on emergencies, to work the machinery of a farm—long experience, and familiarity with the details of husbandry, qualify them in a great degree; but in Ireland, our perfect models are very few indeed, whether in agricultural seminaries, or on the private farms of the land proprietary. The proportion of good farmers living by husbandry is small, and it is among them that the most practical bailiffs ought, in altered circumstances, to be looked for and found. The farmer's house and establishment is the true nursery for the class of men in question. Why does the emigrant to Australia, or the Cape of Good Hope, or any great sheep country, seek in Scotland for an intelligent and experienced shepherd? Because sheep-farming, in all its branches, is perfectly understood in that country. The Highland and the Lowland shepherd have their distinct habits and practices, and there is no district in which a suitable shepherd may not be found, fully trained in his vocation by the sheep-farmer in whose service he has been, perhaps, from boyhood.

Again, for illustration.—In the north of Germany, a young man who is to be trained as a bailiff of any class, is required to work on the farm of a practical husbandman for at least three years, as an apprentice, before he can gain admittance into an Agricultural seminary, in which he must pass four years, in every kind of labour; after that servitude he may obtain the situation of the lowest

kind of bailiff on the farm of a land proprietor, or of a farmer who rents his land; or, what is very common, if his means do not permit him to enter one of the admirable Agricultural schools, which have been many years in active operation there, he binds himself—after his first three years' drudgery—on his father's farm, or that of some other person, to a more eminent agriculturist, in a capacity which may be considered that of a principal labourer; for no prudent farmer would think of employing him in a higher rank until he had obtained much more experience, and the scientific information also which the seminaries and model-farms are designed to afford. In short, seven or eight years of patient industry must be passed by these men in Germany before they can presume to expect employment, even in the humblest capacity of superintendence, and many more of practical occupation in this lowest grade, before they can reasonably hope to fill either of the two higher ones. And their expectations as to amount of wages are moderate in a corresponding degree.

These then are, I conceive, the true models for us, and no efforts should be spared by our land proprietors to encourage the discipline of their tenants' sons in this way. The pupils hitherto instructed in our schools have been, for the most part, too much above the peasant class, and filled with exaggerated notions of their own acquirements, and very sublime opinions on the subject of salary,—impressed with the mistaken idea that a smattering of scientific education, neatness of execution in drawing maps, correctness in book-keeping, acuteness in solving problems, and such qualifications, important and essential though they be—are of themselves sufficient qualifications for the situation of land-bailiff, which requires so much experimental knowledge, and so much experience. That numerous model-farms may be so organised, and schools so conducted as to educate the peasantry in a generally useful and practical way, is my anxious wish.—*Martin Doyle.*

ON THE SOIL AND CLIMATE OF THE SHORES OF THE MORAY FRITH.—No. II.

(*Continued from page* 154.)

Distribution of the Secondary Rocks.—The prevalence of one or other of the members of the great sandstone series now described, influences much the agricultural characters of the different districts. Thus, in Morayshire the upper silicious beds of the deposit proponderate, and hence that district is distinguished for its light, sharp, sandy soils; enriched, however, in very many places by the lime or cornstone formerly alluded to, and by the debris (especially towards the Loch of Spynie and the Laigh or low grounds of Moray) of the lias shale, and by rich modern alluvial deposits.

Protected on the east and north by the high mountains of Banff and Aberdeenshires, and on the west by those of Inverness-shire, which attract and break the great volumes of watery clouds passing over the island from the German and Atlantic Oceans, the district of Moray has always been regarded as possessing a kindly soil and a genial climate; and farther back than the days even of George Buchannan it was described as a favoured spot, and as the granary of Scotland.

In Nairnshire, the silicious beds so greatly predominate and are so near the extensive granitic and primary mountains, intervening between the rivers Nairn and Findhorn, that the whole upper covering of that county consists almost exclusively of a fine loose sand, whence the soil is exceedingly light and porous, and the coating of vegetable mould extremely thin.

As we approach Inverness, the upper and middle schists and freestones of the secondary series, thin out and almost disappear, their line of bearing being prolonged across the Frith into Ross-shire. And accordingly for several miles to the east and west of our Highland metropolis, the fundamental or most characteristic members of the old red sandstone formation are alone to be seen, namely, a chocolate or brick-red compact rubble-stone and huge imbedded masses of a granitic and quartzose conglomerate; the latter presenting themselves chiefly in mural escarpments, or forming the rough summits of the hills. The sandstone penetrates far inland into the Great Glen, composing the beautiful and fertile valley of Urquhart, on the north side of Loch Ness; above which it has been tilted up by the subjacent granite, into the mighty dome of Mealfourvoney, an enormous rounded mass of conglomerate, overhanging a stupendous precipice of granite. The same structure extends around the inner basin of the Moray Frith, called Loch Beauty, along the top of which a beautiful and varied chain of sandstone-hills extends in a curved line; thence deflecting boldly off into Ross-shire, and skirting along the southern flank of the great mountain Ben Nevis. In the fine valleys of the Conon, Strathpeffer, Ferindonald, and Easter Ross, this belt of old red sandstone is covered to a great depth by the soft argillaceous shales of the middle division of the series, so highly charged with bituminous matter as in some few places to contain small inflammable portions, and so much up-heaved and dislocated by the granitic masses below, as to present their strata at every possible angle of inclination, and so broken as to be readily decomposed by the rains and frost. Hence, the surface is beautifully varied and undulating, and the rocks being seldom horizontal, the water easily percolates between their joinings, so that the drainage is good, and the ridges gently sloping, except along the sea-shore, where there are occasional flat fields of rich clayish loam.

The Agricultural zone in Sutherlandshire is confined to a narrow strip along the coast, seldom exceeding a mile in breadth; but it is a beautifully sloped acclivity, rising up along the front of the red sandstone conglomerates, which here rest immediately upon granite, and next the sea there are a few slight remains of the lias and oolitic shales and grit, which anciently extended far out, if not across, the trough of the Moray Frith; and in addition to these, the soil is enriched by the cornstone and other limestones, which are plentiful, especially near Brora and Helmsdale. An enormous protruding mass of granite composing the Ord of Caithness, over which the public road ascends to a height of 1200 ft., interrupts the continuity of the secondary strata; but behind it the old red sandstone and its coarse conglomerate re-appear in the high chain of prominently-marked mountains, which form the boundary betwixt Sutherland and Caithness, and which, observing a north-westerly course, fall into the Northern Ocean at the fishing-station of Port Skerry. From this elevated silicious platform the county of Caithness falls rapidly towards the north and east, composing one enormous undulating inclined plain; the rocks at the further ends dipping into the sea in low horizontal ledges, or cut up by it into long lines of beetling cliffs and headlands. The mass of the Caithness schists has not been disturbed by granitic or trapean action from below, and hence the rocks are nearly horizontal and impervious to water, and the surface is in consequence disfigured by an immense number of stagnant lochs and marshes, and by vast accumulations of peat and bog, rendering the climate cold, and the drainage difficult. Yet even here, though totally devoid of trees and shelter, the persevering industry and intelligence of the proprietors and tenants have reclaimed and brought under the plough a large extent of land, and the fat stock now reared in Caithness are not surpassed in size or beauty in any part of the north of Scotland. These spirited exertions are no doubt much favoured by the circumstance that in Caithness there is an immense development of the mid-calcareous and bituminous shales which are extensively quarried as fine paving-stones, and which everywhere abound with the traces of extinct races of vegetables and fishes; and also that the outer promontories are formed of members of the highest sandstone series (similar to those of Moray and Tarbet Ness in Rossshire), which are more easily cultivated and more clayish in their texture than the hard dark-red beds of the inferior sand-stones next the primitive mountains. Those middle schists of Caithness are likewise prolonged across the Pentland Frith, into the Orkneys, where an exactly similar arrangement exists as on the mainland; there being first a central nucleus of primitive gneiss rocks near Stromness, on which rests a great pavement of old red sandstone, having over it deep beds of calcareous and bituminous shales and grits, and these finally surmounted (especially in the island of Hoy), by an enormous deposit of lighter coloured and variegated freestones, but all banded together into one great formation, by the dissemination throughout the layers from top to bottom, of the same or similar tribes of organic remains. In Orkney also we have the further addition, which is rare in the other districts we have been considering, of extensive dykes and veins of secondary traps and porphyries, the decomposition of which adds considerably to the Agricultural value of the soil.—*G. Anderson, Inverness.*

ON MINERAL AND INORGANIC MANURES. No. XII.

By PROFESSOR CHARLES SPRENGEL.

(*Continued from page* 187.)

On very fertile soils, marl will avail little or nothing, which is easily explained by such soils being already possessed of all mineral substances which are required for luxuriant vegetation. Such a soil requires but good care to yield abundantly, and thus marl is superfluous.

It is often the case that a marly soil is considerably improved by the application of marl. This is easily explained by the former not containing in sufficient quantity all the mineral substances required for vegetation; it may be deficient in gypsum or magnesia, which the other sort may supply it with, and thus make it more fertile. And this fact affords (so it seems to me) an additional proof that these mineral substances are a real food of plants.

In places where marl manure has been used for some time, people have observed that the land which once got marl, cannot be kept any more in a good condition by merely manuring it with dung: it must be marled from time to time, in order to make it yield good crops. On this account people are very cautious in such places not to manure a field with marl, the produce of which has been hitherto satisfactory. Without doubt this phenomenon rests on the fact, that dung does not supply the soil with a sufficient quantity of certain mineral substances, especially not with lime, magnesia, phosphoric, and sulphuric acids. The accuracy, however, of the opinion that a soil is not to be made accustomed to marl, is much to be doubted, because if better crops have repaid twice or thrice the expenses of the one application of marl, why should this process not be repeated?—the expense is repayed by abundant harvests.

Very often the 1st application of marl has a greater effect than the 2d, 3d, or 4th. Nothing is easier to be explained than this; for in a soil never before marled, the lime of the marl will find much of the coal of humus to dissolve, and thus bring powers into play which were hitherto slumbering. Subsequent applications of marl will therefore find less of carbonic humus to dissolve, for a very long time elapses before a new portion will be formed. The greater, therefore, the intervals at which marl is applied, the more striking is the effect. Still, our readers must not believe that we ought to wait the whole interval till the soil again acquires a large amount of coal of humus; on the contrary, it ought to be made a general rule to repeat the marling as soon as the soil is deficient in those mineral substances with which the marl at our command may supply it. It is easy to ascertain, by the condition of the crops, whether the soil is thus deficient. There is certainly a means of obtaining from every marling a similar good effect, viz., to manure the soil not only with dung, but at times also with mould or vegetable earth, as it will thereby receive back that humus which the last marling has decomposed. Large quantities, however, of this mould are thus required; because, if the soil previously contained only 3 per cent. of humus, this will amount, in a furrow-slice six inches deep, to 40,000 lbs. in the Magdeburg acre of land; and it is impossible (even if it were to be useful in other respects), to supply the soil by dung alone with such a large amount of humus, 20,000 lbs. of dung yielding scarcely 2000 lbs. of humus. It is on this account that it is so difficult to replace the humus once taken from the soil, and the greatest caution is therefore to be taken as well in the application of marl as of lime, for a hundred years may not suffice to remedy what has been spoiled in a dozen.

It has been further observed, that the better the crops succeed after the application of marl, the sooner the exhaustion of the soil takes place. In order to explain this phenomenon we must observe, that a greater mass of vegetation encroaches upon a greater amount of the mineral substances of the marl. The weight of any crop is always in a direct proportion with the weight of the mineral substances which the soil has yielded towards its development; because in 1000 lbs. of Clover there is always twice as much potash, phosphate of lime, sulphuric acid, &c., as in 500 lbs. Even the carbon of the soil is more encroached upon by 1000 lbs. of Clover than by 500 lbs., and if we observe that after luxuriant Clover, corn will grow better than after one of a poor extraction, this results from the former always leaving a larger weight of roots behind in the soil. As it may well be supposed that by marl more coal of humus may be decomposed and converted into vegetable nourishment than the plants may be able to consume at the time, we must take care not to use too much of this mineral, as that humus which has been decomposed and is not used by the plants, is liable to loss by volatilisation and extraction by water, and the coal of humus is to be considered as a treasure not to be drawn upon but by necessity. It is, indeed, one of the most important substances for vegetation, because through its instrumentality Nature has guarded plants against being deficient in nourishment; in it many nutritive substances for plants are stored up. Notwithstanding this, however, it is often considered as a useless ingredient of the soil, and every one tries to get it decomposed as fast as he can. It is the coal of humus which chiefly heats the soil, by its detention of the rays of the sun; it is this, also, which loosens the soil, and supplies it with moisture, as it possesses great hydroscopic power: its value is rarely sufficiently appreciated. If, however, marl is used with discretion, we never need apprehend that the soil will be deprived of its strength, because, even if the plants growing more luxuriantly should deprive it of more mineral substances, yet the greater amount of vegetable matter will furnish us with the means to prepare more manure, and we can thereby return what has been taken from the soil.

(*To be continued.*)

MECHANICS AS APPLIED TO AGRICULTURE.

[THE following is an abstract of a lecture on this subject delivered by Mr. Cottam, on March 8th, at the Royal Institution—the President, Lord Prudhoe, in the chair.]

To state that within the last few years the character of English Agriculture has materially changed is, perhaps, superfluous. The great problem that we now attempt to solve is, how to draw from the land the greatest possible product at the least possible expense; and this not for one year or for two, but for many years in succession. In this consists Agriculture as an art. Subordinate to this, however, each in different degrees, but all more or less subordinate, is a long range of subsidiary sciences. It is the recognition of the importance of these subsidiary sciences wherein consists the improved character of the Agriculture of the days we are living in. It is not enough at the present time to cultivate our lands as either empirical experimenters or as the indolent followers of established practices. Of science, in more than one shape, we call in the aid and assistance. The value of the particular science of chemistry, and its bearings upon the all-important subject of artificial fertilisation and manures need scarcely be pointed out. The labours, first of Davy, afterwards of Liebig, have not been expended in vain. The importation even of foreign manures has become a large element of English commerce. We fetch bones from the continent of Europe, and guano from the islands of America; and doubtless in this department of traffic new sources will be discovered and made available. In the desert between Egypt and Syria the bones of unnumbered horses and camels that have whitened and accumulated during the lapse of centuries afford a supply that, according to the report of eye-witnesses, is inexhaustible. Over and above the importance of geology in all matters of drainage, that science has discovered the manures that chemistry has indicated. Liebig had scarcely shown the importance of the phosphates when Professor Buckland indicated an indefinite supply in those remarkable fossils called coprolites, which analysis has shown to be rich in the phosphate of lime. Beds of coprolite underlie whole areas of the counties of Huntingdon, Bedford, and Cambridge, which a subsoil plough could reach, and may be brought to the surface and exposed to the decomposing influence of the atmosphere. In the Spanish province of Estremadura, a whole stratum of phosphated rock has been discovered. A part equally conspicuous with that of chemistry and geology,

is played by the sciences of botany, zoology, and physiology. These determine the choice of seed; the culture of artificial grasses; the value of stock; merits or demerits of particular breeds of cattle; the methods of feeding and fattening; and thus, in a manner too direct to be overlooked, influence the great question of economical agricultural production. The points of agriculture that bring us in contact with the exact mathematical sciences, and with natural philosophy, are numerous, varied, and dissimilar. The method by which we lighten the draught of plough or carriage, and the plan by which we convert by means of drainage whole areas of unproductive moss into fertile soil, are alike subject to the exact calculations of mathematics, and alike involve the science of the mechanical philosopher, the skill of the engineer, and the practical ingenuity of the mechanist. It is upon the latter subject that I have this evening the honour of addressing you; and I feel certain that in the points which I shall attempt to illustrate, viz., the Improvement in Agricultural Implements and Machinery, we have not only a department of agriculture far from unimportant, but also one wherein the progress made in late years is quite on a par with the advancement made in the other sciences, applicable and subsidiary to the art of agricultural production. The agricultural engineer has to contend against difficulties unknown to all other branches in the whole range of manufactures. In manufactures you have everything at command. If you require a high temperature to spin cotton in, it is easily obtained; if a moderate one for silk, it is as easily to be had. If you require a very moist one for flax, or as it is found now to be better spun in water, it is easily accomplished. If a difficulty is met with, once removed, it is wholly removed. Not so with Agriculture: in this we must take wet or dry, hot or cold, as the season may happen to be.

(To be continued.)

ON THE APPLICATION OF CHEMISTRY TO AGRICULTURE UPON RATIONAL PRINCIPLES.—No. XII.

(Continued from p. 186.)

I HAVE stated above that the carbon of plants is derived from the atmosphere. This is the opinion of Liebig, who confines the use of humus (which by its decomposition sets free carbonic acid), to the young plant, before its leaves are sufficiently matured to absorb it from the atmosphere. But I do not think this question by any means settled; and we yet want a series of sound experiments to decide the point.

The effect produced by carbonised manures, such as rotten straw, on the crop of Corn, or on tubers, as Mangold Wurtzel, Potatoes, and Turnips, is sufficiently striking to throw a strong doubt upon such effect being entirely due to the ammonia and inorganic constituents. If the amount of starch in Wheat were found the same in a crop manured with urine, and that treated with rotten straw, the inference would be just—*cæteris paribus*—that the carbon of this starch was derived from the atmosphere. If the difference were in favour of the rotten straw, it would be fair and rational to assume this as the source, and to conclude the opinion of Liebig to be erroneous. But Liebig affirms that if we supply a plant with nitrogen we enable it to attract more carbon from the atmosphere.* If this opinion is correct, we may fairly arrange the food of plants into two classes, direct and indirect nutrients. Thus, if, according to the opinion of Liebig, we supply a plant with a certain amount of nitrogen, this nitrogen will fix a certain amount of carbon in the organism of the plant. Every 15 parts of nitrogen requires 55 parts of carbon to convert it into gluten or albumen, which according to the above supposition is drained from the atmosphere, and thus the nitrogen becomes the indirect means of supplying the plant with carbon. If this fact be established by sound experiment, it is very important, because it adds another element to those supplied by the urine—it would render the use of straw-manure less necessary in soils abundant with the inorganic constituents of plants, and infinitely increase the already great value of urine as a manure.

But Liebig's view of the use of nitrogen as a fixer of carbon, it is clear, can only apply to azotised crops. In Turnips and Potatoes the proportion of nitrogen to the carbon is as 1 to 10 or 15. Here the carbon is in much greater proportion than could have been produced by the union of nitrogen with it to form gluten or albumen. Whence, then, is the excess of carbon? If we increase the weight of a Turnip by a pound, by adding rotten straw and dung manure, and we find the increased amount of nitrogen insufficient to fix the additional carbon, we naturally infer that it must have derived it from the decomposition of the manure. But this and other important questions can only be decided by experiment—mere inferences may lead us to inquire, but they are useless in application to practice, unless confirmed by experiment.

What I have just said, however, will prepare us for considering a very important point, which has hitherto been much neglected in performing these experiments,—I mean the necessity of adapting the manure tried to the crop grown. Thus, if Liebig's assertion is right, that plants derive their carbon from the atmosphere, and that a supply of nitrogen increases their power of absorbing it to the extent necessary to form albumen; then if we apply urine or guano to Turnips, or Potatoes, or Beet, much of the azote must be lost to the crop, which only contains one part of albumen to every nine of unazotised matter; whereas, if we apply the same manure to Beans or Peas, one part of albumen is required for every two of unazotised food! It thus requires no illustration to prove that to test the value of urine or guano as a manure, it should be tried upon Beans, Peas, Wheat, or Barley. I do not wish to be misunderstood. I do not mean that guano or urine will have no effect upon the tubers, but that different results will be obtained if they are applied to the Corn crops; that an azotised crop is the proper one to test the real value of an azotised manure. The weight of grain is increased by the deposition of gluten; that of the Turnip, by sugar or starch. In the former case, the action of the azotes may be said to be almost unlimited; in the latter, it is confined within certain limits.

But it may be asked, Does not an azotised manure, or any other manure, act as a stimulant to the roots of plants, and thus increase their growth? The question is important, and deserves inquiry; for it is one upon which the minds of nine out of ten are made up in the affirmative. Our notions of a stimulant are formed from the effect produced by certain substances upon the nervous and circulating systems of animals. If a man drinks a glass of brandy, it extricates nervous influence in the heart and arteries, and produces increased action in them. Thinking of this, we are apt to assume that a strong application of manure has a stimulating effect upon plants. But, whatever the effect of this upon plants may be, we must entirely reject the notion of its being similar to that upon animals. In the first place, plants are destitute of a nervous system; and I know of no proof that their circulating fluid—the sap—is increased in the velocity of its ascent or descent by the application of manure. Does it cause the roots to penetrate further into the soil in search of proper food, and thus act as a stimulus to them? We are again met by the same difficulty—the want of a nervous system; but we have a still greater objection to this notion in the statement of Liebig, that the carbon of plants is derived from the atmosphere, and therefore the search of the roots, to which they are assumed to be stimulated, would be useless. If, however, we carefully observe the action of manures, we shall not fail to reject entirely the notion of stimulants, and attribute their effect to the simple supply of abundance of food by which their rapid growth and increase in bulk is occasioned. Thus, nitrate of soda, or potash, will give a green, rank appearance to the blades of Corn. We have shown the alkali to be one of the constituents of the stalk; and being supplied with abundance of material, an increased size of the fabric results. The green colour is a well-known effect of the addition of alkali to vegetable matter, as every cook who adds soda or potash to the water in which she boils her Peas or Kidney-beans well knows.

Again, the effect of stimulants is not that of increasing the bulk of the animal. Some men, who drink hard, certainly accumulate fat, but this is not the result of eating more, for the converse is generally the case: it is caused by the elements of the alcoholic fluid producing a superabundance of carbon in the system, which is converted into, and deposited as fat. But if a stimulant, properly so called, were applied to the roots of plants, it would destroy their vitality, and the plant would die.

We must, then, altogether reject the notion of any manure or application to plants acting as a stimulant. The effect of strong manures in making plants grow is owing to the supply of abundance of food. Potash will not make the roots take up azote, nor azote potash; they are each taken up by the roots, and appropriated to the peculiar part of the plant they are destined to form or increase, and azote can only enable a plant to fix as much carbon as is necessary to form gluten, albumen, or fibrine. This digression will be excused, as the subject is very important in deciding the *modus operandi* of manures.

Having said so much about the theory, let me now make some remarks upon the confirmation which the principles I have advocated receive from the observations and experiments of others.—*C. R. Bree, Stowmarket.*

(To be continued.)

Home Correspondence.

Transplanting Swedes.—I attended the Show of the Royal Agricultural Society at Liverpool, and the evening after the great dinner joined a party of farmers at the Angel Hotel, and was induced, after discussing various subjects, to detail to them my practice and success in transplanting Swedes, which was listened to with great attention, and one of the party said—"I have travelled many miles from the north to this great meeting; and I thought I should return home without 'gaining a wrinkle;' but I discover that what you, Sir, have said about transplanting Swedes, is the best information I have obtained." Several expressed themselves to the same effect, and requested me to repeat the subject. The recollection of that circumstance, and the uniform success that has attended my plan, induces me to send it to you for publication. The land I have always appropriated to the purpose has been that which has borne a crop of winter Vetches, and which is in general cleared by the middle of July. It must be prepared by ploughing, rolling, &c. &c., as it would be for seed; also by cutting out the ridges, laying in the manure, and spreading it, and all is ready for planting. The plants having been drawn from the seed drills, and placed at convenient distances for the planters (women, girls, or boys), the length of the land is to be divided into as many equal distances as you have planters, the ploughman then turns one furrow on the manure, and the planting begins. The row finished, the plough returns, and, with a lighter furrow covers the plants. Each planter should be directed to follow the plough, watch the covering of the plants he has laid down, draw out any plant too much covered, or cover any displaced by the feet of the horse. Whilst the plough is returning in the next furrow, the planters will supply themselves with plants, and take their places as before, to be ready to lay them down so soon as the plough has passed. In windy weather, and when the plants are large, it is better to direct the planters to lay a handful of soil on the roots to prevent their being displaced. The planters must be urged to quickness, &c.; and those who may be induced to try this plan will be surprised how very fast the work will be performed; and when a sufficient number of hands can be procured, two or more sets can be employed in the same field. The after-work is very little—drawing the soil from top to root, from between the plants, and cutting up the few weeds that may appear, is all that is necessary. I planted Swedes one remarkably hot and dry summer, when the soil was "as dry as the dust on the turnpike-road." The leaves were in two or three days so completely dried, that they could be rubbed to powder. However, two-thirds of them grew, and produced a fair crop. The Swede plant is not easily killed; and I prefer the soil rather dry than otherwise for transplanting. The advantages are these—you are sure of a crop—the expense is less—and the weight per acre is greater than that raised from seed. My seed-crop last year was so much destroyed by the fly, that I could not draw a plant further than to fill up vacancies, and I was "put to my shifts" to plant my ground. I purchased 10,000 plants, at 1s. per 1000, of a gardener, whose foreman had sown Swede instead of Cabbage seed. They were seven or eight inches long, and like sticks, and queerly-shaped bulbs they made; but the weight per acre was much greater than that from the seed crop, and would have surprised anybody. I am so thoroughly convinced that a more equal and better crop can be raised by transplanting, that I fully intend to transplant my main crop, and shall sow seed to grow plants the first week in May. I hope that some of those gentlemen who may be induced to try my plan will give the result through your Paper next autumn.—*W. S.*

Yew poisonous to Animals.—Seeing an article on this subject in your last *Gazette*, I send you the following extract bearing upon it from Anderson's "Rural Economy," published in 1798. No plant in Britain is a more certain poison to domestic graminivorous quadrupeds than the common Yew-tree, and many are the instances of cattle, horses, and sheep being killed, which have accidentally tasted of its leaves and young twigs. Yet it is a very surprising fact that in the province of Hesse, in Germany, where hedges of this tree abound, the peasants feed their cattle through the winter with its tender shoots, which they find a very excellent and nourishing food, at a season of the year when other sorts of succulent food cannot be easily obtained. Prof. Wiborg, of Copenhagen, hearing of this, was at first inclined to think that the common opinion that the Yew-tree is a poison to animals was unfounded; but experiments soon satisfied him, to his cost, that it certainly was so. He then suspected that the tree called by that name in Hesse must be something else than the common Yew, and he determined to take a journey thither to ascertain the fact. He found it was the common Yew-tree, and by experiments he then made he also found that it proved equally poisonous to beasts in Hesse as it had been in Denmark. He then suspected that he had been misinformed in regard to its being there used as a food for beasts in winter; but here also he was soon satisfied he had been told only the truth, as the peasants readily allowed that they used it for that purpose every year, and that it made a valuable part of their winter provender. Surprised at these facts, he then inquired what were the means they employed to destroy its poisonous quality; but to this they could give him no satisfactory answer. All they knew of the matter was that they found it necessary, at the beginning of each season, to use it sparingly at first, and to give it to the beasts along with their other food; that they gradually increased the proportion of Yew twigs, which at last came to be a principal part of their food, but that they never kept their beasts entirely on that food alone. At the first he suspected that in this case, as is experienced by man in regard to opium, the animal frame gradually became habituated to this drug, so as to admit of its being taken in much larger doses, in time, with safety, than could have been practicable at the beginning; and it seemed to him probable that its deleterious effects were counteracted merely by the operation upon the animal economy of other food that was administered along with it. Convinced of this, he ventured to give at once to a horse eight ounces of green Yew twigs, (which he had previously repeatedly found was sufficient to kill any horse, when given by itself,) chopped small and mixed among 20 ounces of Oats. This mixture the horse readily ate up at the first, nor did the smallest symptoms of any disorder appear. This experiment he so often repeated as fully to ascertain the fact that, when administered in this manner, the Yew-tree was perfectly innoxious, and that it is solely to the circumstance of its being always administered along with some kind of dry food in Hesse, that it proves there salutary instead of hurtful.—*M. S.*

Gorse.—"Vijora's" remarks on preparing Gorse as food for cattle, remind me that when a boy we used it as food for horses (in Forfarshire); and as at that time machines for those purposes were not so common, the means used was to place the Gorse on the barn floor, and thresh it well with the flail; and this was found to answer well, and the cattle to improve by its use. As every one may not be in possession of a machine for bruising it, perhaps it may be useful to know that the above method will answer until such time as they get a better.—*A. C.*

Allotment System, and Liquid Manure.—I beg to submit to the judgment of your readers a few observations, in order to draw public attention to the importance of this subject; and in doing so, I shall simply detail my own practice, and take especial care to advance no opinions which I have not tested by long experience. To the labourer who keeps a pig in the sty, I would say, the inner and outer yards should have a paved bottom, with a

gentle slope to one point, at which point a hole should be made, if the subsoil be an impervious clay; or, what is better, a tar-barrel, or something of that sort, should be inserted in the ground, with its top on a level with the surface, and covered with a lid of some sort. Into this hole, or tub, all the drainings will run; and into it should daily be poured, when there is any, all the waste wash, soap-suds, &c., that the cottager's wife can command. Whenever the hole, or tub, is full, it must be emptied with an old bucket, or watering-pot, not used for other purposes, and carried into the garden, either to the different crops, or when they do not require it, to some vacant place before cropping, for which it will be an excellent preparation. It may be applied with great advantage to the roots of Gooseberry, Currant, Raspberry, or other fruit-trees, not merely to the stems, but at some distance from them. I dare say it is often out of the power of many respectable labourers to procure a tar-barrel. If his own resources be inadequate, let him state his case and his intentions to his landlord, or neighbours, and they, one would hope, would readily aid him in such a laudable object. To the owner of a cow, or a horse, &c., and who is generally the occupier of more or less Grass-land, this subject is also important. In this case there will probably be a stable or cow-house, and, if of a good size, the tar-barrel will, in my opinion, make a cistern large enough for a cottager who keeps two cows, or a cow, horse, and pig. If he also have a fold-yard, the draining from that, as well as from the pigsty and eaves of his house, should all run into it. The waste of the house, too, must help to fill it. The cottager must also see that all the dung his cattle drop in the field or near his house is carefully collected, and put into the tub, and stirred well up before using it. I believe that to be the best way of using out-door manure. Or he may collect it often, and throw it upon his manure-heap at his house; or do with it as recommended in a previous article. In disposing of the liquid the cottager must attend to his Grass-land; and if it be close to his house—as it always ought to be—he will easily apply it by means of a bucket or watering-pot, which should be emptied all at once with a jerk, to spread it, taking care to select the barest places on which to apply it. Nor must he forget the claims of his garden. I have been in the habit of applying this liquid manure at all seasons of the year. I have manured, the last dry summer, a great deal of close grazed land in this manner with the best effects, and I never observed any burning or scalding from it when applied in any state, or at any time. In a very short time after applying it the herbage springs up luxuriantly, and is greedily eaten by cows, horses, and pigs. This plan of managing liquid manure is much better for the cottager and small occupier of land than catching the drainings, and returning them again upon the dung or compost heaps, as recommended by some popular writers. The benefit is immediate, sure, and without waste.—*W. Billington, Oswestry.*

Foot-rot in Sheep.—Caution.—While your readers' attention has been turned to the disease of foot-rot in sheep, when either house-fed or kept in a damp situation for any length of time, I would beg to offer a caution to shepherds, and others looking after the animals, when so affected. If any of the matter of foot-rot come in contact with a sore or abraded surface on the hand or other part of the body of a person tending the animal, it is apt to produce a violent inflammation and rapid mortification of the part,—a disease termed by medical men gangrenous inflammation. A shepherd in this neighbourhood nearly lost his life from this cause lately, and the disease was only arrested by burning out the whole affected part. The mode of treating sheep when labouring under foot-rot here, is to clean the parts diseased, and apply the strongest nitrous acid carefully with a straw, or glass rod. This very soon conquers the disease. Those animals affected with the complaint should be immediately separated from the rest of the flock, as treading in the same footsteps will spread the disease from the tainted to the free.—*J. L., Newburgh.*

Fieldbeet v. *Mangel Wurzel*, alias *Mangold Wurtzel.*—In the last Number of the *Agricultural Gazette*, your correspondent "S." comments upon "the barbarous mode often adopted of spelling this name Mangold Wurtzel," and pretends to show that it should be called Mangel Wurzel. This is decidedly exchanging bad for worse, as will be seen from the following explanation:—The word Mangold signifies Beet, and is applied in Germany to Leaf-beet (Beta cicla, L.), which is grown in gardens for the sake of its leaf-stalks, which are eaten like Seakale. Wurtzel, or more correctly, Wurzel, signifies root; Mangold Wurzel, therefore, is literally Beetroot, a name given to a variety of Beta vulgaris, L., of which the Field-beet and Sugar-beet are also varieties. As for Mangel Wurzel, which literally means root of scarcity or deficiency, it is ridiculous to suppose that this root should be abundant when other crops have failed. If your correspondent "S." is not content with the proper name of Fieldbeet (however generally adopted that of Mangel Wurzel may be), and if he should have a predilection for foreign names, then let him import those of "Runkelrübe," "Knollrübe," or "Dickrübe," by which the Fieldbeet really goes in Germany; as for that of Mangel Wurzel, he may in vain ask for it in the seed-shops on the Continent. How the word Mangel Wurzel came to be received in English I am not prepared to say, unless we allow the usual dose of distortion in adopting foreign names. With regard to consulting dictionaries for the proper translation of technical or scientific terms, the following example will show how far such authorities can be depended upon:—The word Melocoton is applied in Spanish to a yellow-fleshed clingstone Peach; in some fruit-catalogues I find it changed to Mélecoton and Mallacoton; in an English and German dictionary, I find the original pure Melocoton, but for an explanation I must turn over to Melicotony, where I see it translated "a Quince," "a Peach." Not satisfied with this information, I refer to a Spanish and English dictionary, where, in the mean time, it had grown into "a Peach-tree ingrafted in a Quince-tree!"—*A German.* [Melocoton is evidently the Malum cotoneum of Pliny, which was our Quince, whence the Melacotogna of the Italians; it has been applied to the woolly clingstone Peaches on account of their resemblance to Quinces.]

Remarkable Heifer.—Mr. Matthew Bailey, of King's Cliffe, Northamptonshire, killed, on the 7th of March, a Short-horn heifer, in which the left kidney with the fat attached to it weighed six stone and a half, 14 lbs. to the stone. The suet was extremely compact and white, and of the very best quality, and there was not the slightest adhesion to any of the adjacent parts, or the least appearance of disease. The heifer had been in the field without any hay during the winter, till the middle of January, when it was taken up and fed with oilcake and hay by Mr. Boughton, of Fotheringhay. The weight of fat on the kidney is very extraordinary, especially in a beast which had been fed so short a time, and weighed only 58 stone. The other kidney had the usual quantity of fat upon it, and the beast altogether was in excellent condition.—*M. J. Berkley.*

Manure.—The necessity of bringing land, which now lies fallow, into cultivation, becomes daily more pressing as the population increases, and the demand for food is greater. The reason for allowing arable land to remain unproductive, is the want of manure. Cropping the soil where it is well fed is an advantage, as it tends to keep it clean and healthy; whereas the best fallows are often, during part of the year, covered with weeds, which require sustenance, and are stealing that which would enrich grain, and by so doing impoverish the land. To obtain a cheap and lasting manure should be the grand object of the landlords and farmers. The greatest part of household refuse in towns and villages is now thrown away (forming the very essence of food for vegetation), all drains are being led into some neighbouring stream, by which thousands of pounds' worth of valuable dressing is carried into the sea, and lost to the present inhabitants of the country. The fertilising power of night-soil is extraordinary, being too strong for any plant excepting Tobacco, for which it is much used in France. The question arises, How can the off-scourings of towns, &c. be judiciously collected for beneficial use? It is not perhaps possible to save the whole drainage of a populous district, in consequence of the manure being in a liquid state; yet by constructing a succession of reservoirs, of a certain depth, the fluid passing through these would deposit a valuable portion of matter in each; and they might be so connected that any one might be cut off from the rest, to admit of the solid substance settled on the bottom being cleared out for agricultural purposes. These receptacles would answer also for liquid manure, which might be pumped out for watering the land. On examining into the results of experiments tried with various composts, it appears that, in almost every instance, good farm-yard dung carries the palm in giving heavy crops, and afterwards in essentially benefiting the soil more than what may be termed the new manures. Such being the case, it is most important not to discard that which is even more powerful than the common muck-heap.—*Falcon.*

Turnip Seed.—As the following method of treating Turnip seed has proved very successful in preventing the ravages of the flea, I have taken the liberty of sending it to you. A day or two before sowing, put the seed into a sieve and tub of clean water, and rub it quite clean through the sieve, changing the water once or twice; dry it in the sun under a wall or glass, or before a fire. A little flour of brimstone may be mixed with the seed while still damp. If the egg of the Turnip flea is committed to the soil with the seed, this is an effectual preventive.—*A. B.*

Mr. Booth, in the article "Experiments with Manures," states that "the soil is a free light loam, averaging about a foot in depth on a yellow clayey subsoil, interspersed with spar." Perhaps it would have been more satisfactory to the readers of the *Chronicle* if he had told them what sort of spar it was—whether it was calcareous spar—carbonate of lime, gypsum—sulphate of lime, or heavy spar—sulphate of barytes, &c. If it was either of the latter—barytes perhaps—it might have some effect upon the other sulphates which he used.—*Peter Mackenzie.*

British Guano.—I have just received a bag of sea-birds' dung from the Flamborough Cliffs, on the Yorkshire coast; it is like the dark guano. There are recesses in the rocks, where it is a great many feet deep, where this was got; there were a great many tons got up last autumn by the farmers, who were going to try experiments with it, but the time has not come to know the results. If you would like to see a little of it, I will send it you. As there are so many different opinions about guano, you would have a chance of comparing the two together, as we know this to be the real dung of sea-birds.—*A Yorkshire Subscriber.* [We should be glad not only of a specimen, but of the results of its application when they are known.]

Rooks.—Your correspondent "S." suggests that sportsmen should shoot these birds for the purpose of examining their crops, to ascertain the good or evil which they do. I have frequently requested farmers to examine the crops of every Rook which they cause to be killed; some of them having done so, have declared that they would never destroy another. These trials, however, may not be fully decisive, because they will generally be made when the grain is most exposed, whereas the birds must feed all the year. Besides, we have a simple remedy against any evil which they may do, by watching at seed time, or near harvest, when corn is laid. I believe it will be found that they will never touch corn when they can procure grubs, &c.; that is, in moist weather. Similar observations will show that pigeons do not so much harm as many suppose. They will sometimes be found full of Charlock seed, &c. when the farmer shoots them for destroying his Barley; and the grain which they may eat occasionally is only what is left on the surface (and would come to very little), as they cannot move the ground.—*B. W.*

Moles.—I recollect seeing many years ago, that the tenants of the Duke of Buccleuch had resolved to destroy no more of these hard-working animals. Can you tell whether they persevered in their experiment—and with what success? In high farming, without summer fallows, we should take every precaution against destroying our best allies. At least, let us try to distinguish friends from foes.—*B. W.* [Can any one answer "B. W.'s" question?]

Nettles as a Fodder for Cattle.—Some of your readers will perhaps think we are jesting when we assure them that such a common weed as the Nettle may be used with advantage as a green and dry fodder for their cattle. It is much used on the Continent, particularly in Holland, where whole fields are cultivated for this purpose; it is cut five or six times a year. In Holland the horse-dealers give the seeds to their horses to make them brisk, and to give them a fine skin; the roots are also extensively used for dyeing yellow. Nettles either eaten green or dried are considered by the farmers of the Continent to promote the fat of horned cattle, as also sheep and pigs, and the seeds when mixed with Oats are considered excellent for hard-working horses; it is a good food for poultry, and the fibres are manufactured into cordage. In our own country the tender shoots are often used as a pot-herb, and they are said to relieve consumption; it is also much used on the Continent as a salad, for which purpose it is sometimes forced in gardens, when other salads are scarce. If any of your correspondents have made use of this plant as above, we shall feel obliged for the results through your pages.—*J. McI., Hillsborough.*

Steeping Seeds.—I have been not a little amused on perusing the article on Steeping of Seeds, by the Rev. Mr. Huxtable, in page 170 of the *Agricultural Gazette.* It is to be expected, however, that failures will happen on a first trial of the process, as there are many contingencies that will affect the success or failure of it. In many instances, at first, I destroyed the vitality of seeds in endeavouring to ascertain the precise limits of quantity, strength of solution, &c., that are necessary to obtain the maximum of fertilising effect. I expect, however, if in health during the course of this spring and summer, to do so; but, as yet, I must confess that I have not satisfied myself on these points, although my experiments have in this respect been eminently successful. Being the first, in this country at least, who has turned his attention to this subject, I have entered a *caveat* for England, Scotland, and Ireland, in order to secure to myself the right of manufacture, for sale, of all fertilising solutions from salts of ammonia, soda, potass, alumina, silica, magnesia, liquefied guano, &c.; but, at the same time, I should be very glad to hear of other experimenters among Agriculturists who are trying by similar means to increase the productive powers of their own properties or farms. I may soon, perhaps, write you more fully on this important subject; but, at present, I have with difficulty found time even to write you these few lines.—*James Campbell, Dundee.*

Waste of Manure.—In these times of low prices, unusual exertions must be made, and an improved system of cultivation adopted. The soil undoubtedly, were it cultivated aright, would send into the market a third more of the staff of life than it does at present. To attain this desirable object, nothing should be wasted. The dust from the house, ashes of every description, soap suds, the wash not used for the pigs,—indeed, anything tangible either solid or fluid, should go to the general mass of fructifying materials; not, however, placed in a heap in order to allow the most nourishing parts to escape, but cast into a large tank formed out of the soil, if stiff and clayey; and if sandy or loose, the sides and bottom must be bricked. Nitrate of soda on Grass land answers remarkably well every other year, and brings up heavy crops. Grazing the land, or a dressing from the dung-hill on alternate years, keeps the field in good heart, provided it is judiciously drained; without which precaution the expenditure of rich dressings, in anticipation of remunerating crops, is labour in vain. Companies established in all large towns for the purpose of collecting the refuse, &c., and applying them to Agriculture, offer excellent speculations to an overflowing money market, promising a certain and large per centage. It must be acknowledged that a manure composed of a great variety of substances, is more beneficial on any kind of soil than one particular ingredient; this must continue to be the case until a simple mode of analysis can be discovered, by which the component parts of the land may be annually ascertained. The object of these remarks is not to depreciate the value of many excellent preparations lately introduced into this country, but to show that a superior manure exists within the reach of all farmers and gardeners, which is now permitted to waste its fragrance uncared for.—*Falcon, Cheltenham.*

Guano and Turnips.—On reading, at page 174 of the *Agricultural Gazette*, the statement made by John Henry Vivian, Esq., M.P., as chairman of the Swansea Farmers' Club, respecting the failure of his Turnip crop that had been manured with guano, it reminded me of a similar occurrence which happened to a friend of mine in this neighbourhood, and of which I was an eye-witness. Hearing so much about the wonderful effects of

guano as a manure, induced him to make trial of it for part of his Turnip crop; and not knowing anything of its nature, or of the mode of using it, he thought the best plan he could adopt was to sow the guano and Turnip-seed with the Turnip drill, in the same way as when bones are used. He accordingly did so; and after waiting for some time, he wondered why no Turnips made their appearance, as they were doing in other parts of the field. On examining the drills, he was surprised to find that some of the seed had chipped, and made an effort to grow, but had afterwards shrivelled up. Others, again, looked as if they had been kiln-dried, and lost their vegetative power. As a matter of course, the guano was blamed as the cause of the failure, and most heartily was it and every other new kind of manure abused. Nothing, in his opinion, would ever surpass good old farm-yard manure, and anybody might have his share of guano for what he cared about it. Happening to ride past at the time my friend had made this unfortunate discovery, I recommended him to have the part of the field harrowed afresh and sown again, by way of experiment—for I ought to observe, he had applied the guano at the rate of rather more than 3 cwt. per acre. He adopted my suggestion, and, singular enough, in the course of some days, the Turnips which had been sown broadcast made their appearance in rows from one end of the field to the other, marking as distinctly as possible the lines where the drill had deposited the guano in the first sowing. In due time, the intermediate spaces were horse-hoed, and the Turnip-rows thinned to a proper distance. Nothing could exceed their luxuriance. Although sown nearly three weeks later than the main crop, they soon overtook them, and became far superior in every respect—so much so, indeed, as to be the subject of general remark in the parish. Hence I think it may be safely laid down as an axiom in the use of guano, and which has been already mentioned in the *Gardeners' Chronicle*, Vol. iii. p. 383, *that it should never be applied in contact with seeds, as it kills the embryo in germination.—M. E. H.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Weekly Council was held at the Society's House in Hanover-square, on Wednesday last, the 27th of March, present, T. R. Barker, Esq., in the Chair; Col. Henderson (Mayor of Southampton), R. Westbrook, Baker, Esq.; J. R. Barker, Esq.; J. Benett, Esq., M.P.; W. R. Browne, Esq.; F. Burke, Esq.; J. W. Bury, Esq.; F. C. Cherry, Esq.; L. Cooke, Esq.; C. Cure, Esq.; E. D. Davenport, Esq.; A. E. Fuller, Esq., M.P.; B. Gibbs, Esq.; T. Mainwaring, Esq., M.P.; R. A. Slaney, Esq.; Prof. Sewell, and J. Spencer Stanhope, Esq. The following gentlemen were elected members of the Society:—

Child, William, Vernham Manor, Andover, Hants.
Fletcher, Alexander, Milbrook, Southampton.
Coupland, J., Southampton.
Perry, John Watlington, Moor Hall, Harlow, Essex.
Perry, Richard, 18, Chester Terrace, Regent's Park.
Hussey, Edward, Scotney Castle, Lamberhurst, Kent.
Kerrison, Edward Clarence, Stanhope-st., Mayfair.
Holloway, Horatio, Marchwood, Southampton.
Spearing, John B., Chilton, Hungerford, Berks.
Kitson, Rev. Robert, Dean Vicarage, Ashburton, Devon.
Bent, Major John, Wexham Lodge, Slough, Bucks.
Milner, William, Nunappleton, Tadcaster, Yorkshire.
MacNiven, Charles, Perrysfield, Oxted, Surrey.
Newbery, Charles, Godstone, Surrey.
Beardmore, John, Uplands, Fareham, Hants.

The names of 15 candidates for election at the next meeting were then read.

Tussac Grass.—Sir William Jackson Hooker, K.H., Director of the Royal Botanic Gardens at Kew, in reply to an application which had been made to him on the part of members of the Society, who, in consequence of the publication in the Journal (vol. iv. part i. page 17) of an extract from Governor Moody's Despatches to Lord Stanley, having reference to the Dactylis cespitosa, or Tussac Grass, growing on Peat bogs in the Falkland-Islands, were desirous of obtaining small portions of the seed for trial, favoured the Council with the following communication on the subject:—"I should be but too happy, were it in my power, to send you seeds or plants of the Tussac Grass. Some of the latter were living on their arrival in England, but they soon sickened and died. The seed, to a great extent, has been given away and sown in the Royal Gardens, in all kinds of situations, but not a single grain has germinated anywhere. Indeed, I have reason to believe that, in such a climate as that of the Falklands, and with a great disposition to increase by the roots, the Tussac seldom produces perfect seeds; not always, certainly, because while my son was with the Governor there, he raised seeds in the Government garden. I do not despair yet of introducing it. I have a Ward's Plant-case now in the Falklands, and have given instructions to have good tufts of the Grass with roots planted in this case, and *established* before the box is sent home. Should I be successful, you may rely upon it I shall not forget the Royal Agricultural Society." The Council ordered their best thanks to be returned to Sir William Hooker for this communication.

Bone Sawdust.—Messrs. G. W. Lees and Co., of 47, Fleet-street, transmitted to the Council a box of sawdust obtained from bone by means of the lathe, in the ordinary process of button-making. The soundness of the material necessarily employed for that purpose, and the favourable state of division into which it was reduced by the operation of turning, led them to infer that a greater uniformity would attend the application of bones as a manure under these conditions, and a greater produce result from their action, than when employed in their impure or imperfectly reduced state: and they accordingly had received from members of the Society residing in Hampshire and Hertfordshire comparative results of experiments which fully corroborated their opinion. Mr. Fowlie, agent of Sir William Heathcote, Bart., M.P. of Hursley Park, near Winchester, had found the bone saw-dust applied to turnips far superior to any other manure he had made use of for that purpose; and Mr. Heard, of St. Margaret's, near Ware, states: "Two tons and a half of the bone saw-dust were applied upon 10 acres for turnips. The crop was excellent. The "rest" part of the field, 15 acres, was manured in the usual way with farm-yard manure, and the crop was an entire failure, after sowing even a third time. The fly did not attack the part done with the bone saw-dust, but totally destroyed the plant where the farm-yard manure was used."

Bones, Guano, and Ashes.—Mr. Slaney, of Walford Manor, near Shrewsbury, communicated to the Council the results obtained by Mr. T. C. Eyton, a member of the Society, residing at Donerville, in the county of Salop, in his experiments on artificial manures, especially on bones dissolved in sulphuric acid, embodied in a lecture delivered by that gentleman to the members of Wellington Farmers' Club, and at their request printed and published at a small nominal price by Simpkin, Marshall, & Co., London. Mr. Eyton having detailed various experiments made by other parties, proceeds to those instituted by himself, and which are of a very interesting character. "The manures and mixtures of manures I tried," says Mr. Eyton, "are calculated per acre. The Turnips, which were Skirving's Swedes, were mildewed, or probably the crops would have been larger. The largest crop is that raised upon guano and wood-ashes, at an expense of about two pounds four shillings, per acre, or at three half-pence for each bushel of Turnips; the cheapest, that raised upon bone-dust dissolved in sulphuric acid, at an expense of eight shillings and five-pence half-penny per acre. Both guano and muriate of ammonia were tried by themselves, and also mixed with gypsum, at the rate of 220 lbs. to the acre; where the gypsum was applied with muriate of ammonia, the crop was worse than where the muriate of ammonia was applied alone; where gypsum was applied with guano, the crop was only better by six cwts. in the acre than where none was applied, which may have been caused by the vicinity of a drain. We may therefore, I think, fairly conclude, that gypsum is no manure for Turnips, whatever it may be for Clover and other crops. I confess, I am much puzzled by this result, as from an analysis of the subsoil of the field, by the Messrs. Blunt, of Shrewsbury, it appears that it contains merely a trace of sulphate of lime, or gypsum; from which I should, until these experiments were tried, have supposed that gypsum would have had a powerful effect. Muriate of ammonia does not appear to answer well in the quantity used, and if larger quantities were applied, it would be too expensive for the farmer.

No. of Exp.	Description of Manure.	Cost per Acre.	Weight of Crop per Acre.	Measure per Acre.	Cost per Bushel.
		l. *s.* *d.*	Tons Cwt.	Bsh.	*d.*
I.	165 lbs. of muriate of ammonia; 220 lbs. of gypsum	1 10 11	7 1½	154	2½
II.	330 lbs. of guano	1 13 0	15 1	308	1¼
III.	165 lbs. of muriate of ammonia	1 6 6	8 16	192½	1¾
IV.	330 lbs. of guano; 220 lbs. of gypsum	1 17 5	15 14¾	346½	1½
V.	330 lbs. of guano; 11 bushels of wood-ashes at 1*s.* per bushel	2 4 0	17 7¾	423½	1¼
VI.	165 lbs. of muriate of ammonia; 11 bushels of wood-ashes	1 17 6	14 19¾	385	1¼
VII.	1322 gallons of liquid manure (consisting of urine and soapsuds)	..	11 9½	269	..
VIII.	66 lbs. of bones; 8¼ qts. or 33 lbs. of sulphuric acid; 550 gallons of water	0 8 5½	14 6	346½	0¼
IX.	484 lbs. of bone-dust	1 1 7½	14 19¾	308	0¾

"In the above calculation, fractional parts are not included: the following is an analysis of the subsoil. I was told by a former tenant of the field, that it would not grow Turnips; it was, however, drained shortly before the Turnips were sown.

One hundred parts of the soil were found to contain:

Water	11 parts
Silica (or sand)	70 ,,
Alumina (or clay)	15 ,,
Red oxide of Iron	1½ ,,
Carbonate of Lime	1½ ,,
(Loss)	1 ,,
A trace of Sulphate of Lime, in weight not appreciable.	—
	100

"The proportion of silica is that yielded by the soil after the largest stones or pebbles had been removed from it. The seed was sown on the 17th May, 1843, and the Turnips pulled and weighed on the 22d of November. The plants all came up together; nor was there any perceptible difference in their appearance on the 27th of May; on the 14th of June, No. II. appeared to take the lead; I., VII., VIII. looking the worst, and being more backward than the others. On the 20th of June they were horse and hand-hoed; Nos. IX., X., VIII., IV., and V., were equal in appearance to No. II.; on the 21st July, No. V. looked best, and No. I. worst of all." Mr. Slaney then proceeded to call the attention of the Council to the comparative cost of the different manures tried by Mr. Eyton, and stated in the Table just read to them, from which it appeared that the bones and sulphuric acid cost only one farthing per bushel on the Turnips grown; whilst the other manures cost from three to ten times as much. The soil on which they were raised was a tolerably light loam, and, as Mr. Eyton stated, had been recently drained. The bones used were ground into powder, and were the fine siftings from collections of bones. This bone-powder being put into an earthenware vessel, a small quantity of water was first poured over it, and the sulphuric acid then added; when the whole mixture was stirred with a stick, until the bone-powder was entirely dissolved, and the solution being diluted with more water, was ready for use. It was applied to the land as liquid manure, either by means of a common watering pan, or the distributing trough of a liquid-manure cart, care being taken that the liquid should fall on the rows of Turnips just sown. This process, Mr. Slaney understood, was repeated after the plants came up; and in submitting this brief statement of Mr. Eyton's experiments to the Council, he trusted that the interesting results obtained might stimulate other members of the Society to extend the inquiry to other artificial manures, with a view to the determination of their economical application and practical value.—Mr. Davenport, of Capesthorne, near Congleton, Cheshire, fully corroborated the statement made by Mr. Slaney, in reference to the mode in which the mixture of sulphuric acid and bone-dust should be conducted; and as some danger to the inexperienced operator was to be apprehended, from a different mode of proceeding, it was desirable that great care should be taken, not only to effect the solution of the bones, but also to add the sulphuric acid in so cautious a manner as to prevent its accidental ejectment from the vessel, in consequence of the violence of chemical action. With regard to the abstract value of sulphuric acid and bones as a manure, he adduced the opinion of Mr. Burness, of Manchester, a pupil of Professor Liebig, and who had been delivering a lecture or two in Cheshire on Agricultural Chemistry, as unfavourable to its exclusive use; for, although it was no doubt a powerful and excellent restorer of land, it could not be considered as a permanent and efficient manure for rotation of crops, unless combined with other substances.—Mr. Davenport preferred bone manure in a dry concrete form to its being in the state of liquid solution; and had found a mixture of half a ton of bone-powder, and two hundred-weight of guano answer extremely well. The African guano just imported was offered at 3*l.* per ton less in price than the Peruvian guano, but he understood that it contained a correspondingly greater amount of water in its composition. Mr. Townshend Mainwaring, M.P., of Marchivial Hall, near Wrexham, Denbighshire, stated that with him the application of the sulphuric acid and bones had been attended with decided injury rather than advantage to his crops; a result, he had since learned, occasioned probably by the bones employed being left in fragments of too large a size, and consequently not in a state to be at once subject to the chemical action of the sulphuric acid as their solvent; his land having thus not only lost the advantage of the nutriment contained in the bones, but received, on the contrary, the injury of a strong, corrosive, and unneutralised acid.—Mr. John Raymond Barker, of Fairford-park, Gloucestershire, communicated the results of two experiments he tried last year on the effects of ashes, both singly and mixed with guano, on the growth of Swedish Turnips. The first experiment was made by applying a mixture of 40 bushels of coal-ashes, and 20 bushels of wood-ashes, per acre, to a bad piece of heavy land, sown with Skirving's Purple-top Swede, drilled in rows 18 inches apart. The Turnips, on being cleared of their tops and tails, were weighed, and found to give an average of 39 tons, 15 cwt. to the acre. The other experiment was made in a field of good light land, manured with 25 bushels of coal-ashes, and 1 cwt. of guano per acre, and sown with Skirving's Purple-top, in rows 27 inches apart. In this experiment the Turnips were much larger than in the former, and Mr. Barker expressed his regret that the result had not been weighed, as the crop was, without exception, the finest he had ever witnessed, the Turnips being of excellent quality, and of immense size.

Destruction of Insects.—Mr. Read, of Regent Circus, Piccadilly, had leave given him to submit to the inspection of the Council his garden syringes for throwing currents of aqueous vapour or narcotic fumes over the surfaces of trees and plants infested with noxious insects, without the slightest injury to their bloom or foliage. By an ingenious arrangement of the nozzles of the syringes, the currents could be directed to any given point without inconvenience to the operator; and water being introduced into the syringe in its liquid state, passed out through the nozzle as vapour or mist, settling on the plants as the gentle dew. Mr. Read had the thanks of the Council for the favour of this inspection.

Southampton Meeting.—Colonel Henderson, Mayor of Southampton, laid before the Council copies of the various engagements entered into by the Local Committee of the town and neighbourhood of Southampton, with the owners and occupiers of the various sites selected for the purposes of the meeting; along with a Surveyor's plan of the ground on which it is intended to erect the pavilion. These documents were received with thanks, and referred to the general Southampton Committee.

Prizes for Essays.—Mr. Burke gave notice that he should move, at the next monthly Council, "That Silver Medals should be granted to the authors of Essays not entitled to a first prize, but which are yet thought by the Judges to be worthy of commendation; all such Essays to remain the exclusive property of the Society, and to be made use of in such manner as the Society may think proper."

The Agricultural and Commercial Society of British-Guiana transmitted a copy of their proposed laws and regulations; Mr. Sproule of Dublin, copies of his "Essay on the Growth and Management of Flax in Ireland;"

and Mr. C. M. Willich, a copy of the annual Supplement to his "Tithe Commutation Tables:"—for all which thanks were ordered. The Council then adjourned to Wednesday next, the 3rd of April.

AGRICULTURAL IMPROVEMENT SOCIETY OF IRELAND.

Mar. 21.—At the meeting of the Council, the Secretary laid on the table the report of the sub-committee, on reclaiming waste lands in Ireland, relative to the essay or report of Wm. Steuart Trench, Esq., upon the subject, for the Society's medal. The report, which was prepared by Acheson Lyle, Wm. Sherrard, and Wm. Jones Armstrong, Esqrs., entered fully into the subject, and stated that they considered the claimant fully entitled to the medal, for the spirited and enterprising way in which he had executed the work, and also deserving of considerable praise for the mode in which the subject has been treated in the report itself. They felt, however, that it was deficient in some respects, particularly as regards the different items of expenditure; and for this reason the report, together with the observations of the sub-committee, were ordered to be referred back to Mr. Trench, to make such observations by way of notes and commentaries as he should desire, in order to make the work the more valuable for publication in the Society's Transactions this year. A letter was read from Thomas Butler, Esq., one of the sub-committee for perusing the Essays on Manures, stating that he had entered into correspondence with Mr. Blacker and Mr. Coddington, who were associated with him for the purpose, and that they were inclined to pronounce a verdict of "no merit" upon the different productions which had been submitted to them for their decision. It appeared that the Society had only hitherto offered a silver medal for essays and literary productions of the kind, which had completely failed in producing anything valuable or worthy of publication; and that it was most desirable, if the funds of the Society would allow it, that some more substantial prizes in money should be given, for the purpose of procuring valuable information upon the subjects more directly connected with Ireland, and of giving them general publicity among the farming classes.

FARMERS' CLUB.

Cardiff.—At the monthly meeting of this Club, held on the 3d inst., Mr. David in the Chair, the subject for discussion, adjourned from last meeting, was On Road-making, and the Advantages of Turnpike Roads to the Agricultural Interests. The chairman said that few farmers were fully aware of the amount of hauling required on a farm of moderate size, especially if it were an arable one; this item of labour is greatly reduced by having a good hard road to go over. He himself had not believed it was so extensive until he had made the calculation he held in his hand, which he should be happy to submit to the meeting, and should be glad to have it corrected, if they thought necessary. In the first place, he would suppose that a farmer had to lime—

20 acres, at 7 tons per acre	140 tons.
Lime-coal required	60
20 acres of Turnips dunged at 20 tons per acre	400
60 acres of Corn, of all sorts, to be harvested and stacked, at 4 tons per acre	240
40 acres of Hay, ditto, at 1 ton per acre	40
Half the Turnips to be consumed in the farm-yard, or hauled off the field—10 acres, at 15 tons per acre	150
5 acres of Potatoes, at 6 tons per acre	30
Corn to market, crop of 60 acres, at 1800 bushels, at 56 lbs. per bushel, 45 tons—just say only	40
Haulage of stones off Clover, also for draining, materials for repairs, artificial manures, &c.	100
Total	1200

Few of them, perhaps, had imagined that the operations he had stated required so much labour in hauling, and a moderate size farmer would have all these operations to perform; therefore, he believed he had made out that road-making was an object of importance to the occupier of land in general, yet the bye-roads in this country were, in general, in the worst condition possible—often almost impassable—and this in a country abounding in the best materials, most of our roads passing over a lime-stone rock. He believed he might safely say that more money was wasted on the small parish roads in this county than on any other operation connected with the farm.—Mr. Watson said that drainage was a most important point to be attended to. He had recently witnessed the beneficial effects of drains under a road in a very striking manner. The road, which was a very public one, was always wet in the centre. He had recommended an underground drain, and since this had been done it had been always dry and firm.—Mr. Evan W. David bore testimony to the good effect of drains through the centre of roads on swampy land, having seen a piece of road at Deanston, in Stirlingshire, which had been treated in that way under the direction of Mr. Smith. This was done as an experiment, the portion adjoining having been dealt with quite similar in other respects. When he (Mr. D.) examined the road there was a very great difference in the two portions. The part drained was sound and good, while the other was in ruts and pools.—*Abridged from the Cardiff Advertiser.*

Reviews.

Thorough Drainage in Principle and Practice, as applied to a Dead Level. By John Clarke. Simpkin, Marshall and Co. pp. 46.

This is a very neatly got up pamphlet, describing the present condition of the alluvial and free land in Lincolnshire, and the practical details of modes of drainage applicable to so flat a country. It is addressed to the landed proprietors and others connected with these districts, and will, we doubt not, be extensively read by them. It contains tables of the expenses connected with different kinds of drainage under various circumstances, and is also accompanied by a very accurate statement of the principles on which their efficiency depends. It is drawn up on a very complete plan, and seems well calculated to be an extensively useful little work on the subject.

Miscellaneous.

Trenching with the Spade.—An experiment, that was made in trenching last year, was attended with the following results. The field was about five acres; the soil a strong clay. The tenant had refused to plough it again, as he said it would not bear a corn crop. It was double-trenched in the manner mentioned. The price of the trenching was 10*d.* a rod of seven and a half yards, which amounted to 3*l.* 11*s.* 10*d.* the acre. A tolerable crop of Oats followed this management, perhaps from three to three and a half loads per acre. The grasses which have succeeded them are rich and luxuriant to a degree; and what the most striking circumstance is, that one butt, by some mistake, having been omitted being sown, the difference on this is most remarkable, there being scarcely the appearance of a good grass root upon it, and little else but thistles or the coarsest weeds.—*Rawstorne's Remarks on Lancashire Farming.*

Notices to Correspondents.

Rural Chemistry, By Edward Solly, Esq., F.R.S., Experimental Chemist to the Horticultural Society of London, Hon. Mem. of the Royal Agricultural Society, and Lecturer on Chemistry at the Royal Institution, has been reprinted from the *Gardeners' Chronicle*, with additions, and may be had of all Booksellers, price 4*s.* 6*d.*

Gas-water.—*Govyn.*—Next week.——*H. H.*—The quantity you may apply depends on its quality, which is various. Mr. Paynter, of Cornwall, spread 400 gallons per acre undiluted, with benefit. Apply it now.

Guano.—*A Young Farmer.*—Apply two or three cwt. per acre, according as it appears to be required, and mix it well with a lot of earth before spreading.

Italian Ryegrass.—*Govyn.*—Sow about 1½ bushel per acre.

Lime.—*A Nottinghamshire Subscriber.*—Apply the lime on the Wheat stubble in autumn. Thistles will ultimately die out if you cut them off whenever they appear.

Liquid Manure.—*Anglus.*—You had better put sulphuric acid, till effervescence ceases, into the tank, before throwing the water over the manure heap.

Mangold Wurtzel.—*Dr. B.*—Always use fresh, *i. e.* last year's seed. That of the year before will rarely sprout.

Nitrate of Soda.—*S. L. B.*—Apply to Mr. Fothergill, who reports for us the state of the manure market.

Old Mortar.—*Alpha.*—It will do very well to mix it with road scrapings and a small portion of salt.

Pigs.—*A. H.* is desirous of knowing where he can hear of a thorough-bred breed of Neapolitan Pigs.

Sheepskin.—*Economist.*—Soak the skin in tan-water in a tub for two months; and if you first dip it in lime-water for a short time, it will acquire a red colour. Your best plan is to send it to the tan-yard.

Tallow Refuse.—*An Improver.*—You had better break it small and moisten it in a heap. Decomposition will soon ensue, and you may then mix it with a quantity of farm-yard or other bulky manure. The compost will be valuable.

Whitfield.—*Querist.*—No Report for 1843 has been published. We will endeavour to obtain an account of the experiment you allude to.

*** As usual, many communications have been received too late.

Markets.

SMITHFIELD, Monday, March 25.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3s	8 to 4s	0	Best Downs & Half-breds	4s	0 to 4s	4
Best Short Horns	3	8	4	8	Best Long-wools	3	10	4	2
Second quality Beasts	3	0	3	4	Ewes and second quality	3	4	3	8
Calves	4	0	4	8	Pigs	3	4	4	0

Beasts, 2900; Sheep and Lambs, 25,240; Calves, 75; Pigs, 330.

The supply of Beasts continues good. The trade is heavy, and it is very difficult to maintain our highest quotations. The best Scots are, however, making 4s, but it must be a very good selling Short-horn to make 3s 8d—the more general price for this description is 3s 6d. We have several more Sheep to-day, and a consequent reduction in price; the best Downs sell heavily at 4s 4d, and for the most selling Longwools 4s 2d is the very top. We observe more shorn Sheep to-day, but trade for them is heavy, at from 3s 2d to 3s 6d per 8 lbs. Lamb is more in demand, at from 5s 8d to 6s 4d for small ones of good quality. Veal trade is very heavy, at lower prices. Pork also is lower.

Friday, March 29.

Since Monday, the trade at the dead markets has been so bad, that there are very few buyers here to-day. We have in to-day several that were left over from Monday, and a fair supply of fresh Beasts, but an exceedingly small demand; a great many cannot be sold at all; what sales are effected scarcely support Monday's prices. A prime little Scot is worth about 4s, but the very best Short-horns not more than 3s 6d. Sheep are tolerably plentiful, and the demand is so limited that a great many remain unsold; the very best Downs support Monday's price, but other qualities, in what few are sold, suffer a reduction of quite 2d per 8 lbs. There are several shorn Sheep; the trade for them is excessively bad. Lamb is the only trade in which there is any life, there being an increased demand, and rather shorter supply; small selling ones are making from 6s 4d to 6s 8d, large ones from 5s 4d to 6s per 8 lbs. Veal **trade is exceedingly dull, the very best scarcely makes 4s 8d. Pork is rather lower.**

Beasts, 724; Sheep and Lambs, 3780; Calves, 133; Pigs, 315.

41, West Smithfield.

HOPS, Friday, March 29.

The Hop Market is firm, and likely to continue so, as, beside the small stock on hand, the Parliamentary Returns just published show a decrease in the Hop-plantations of 564 acres, and an increase in the quantity of Malt made of 189,748 quarters in the year 1843, as compared with 1842. Present prices:—

Patterson & Smith, Hop-Factors.

MARK LANE, Friday, March 29.—There are no fresh arrivals of English Wheat, and the parcels left over sell at rather lower prices than on Monday. Free Foreign is a slow sale, and scarcely maintains that day's rates. In Bonded there is nothing doing.—Malting Barley continues in demand.—Beans and Peas are unaltered in value.—There is very little doing in Oats.

Kingsford and Lay.

COVENT GARDEN, March 29.—The weather during the week being fine, the market has, generally speaking, been well supplied; but trade is not brisk. Pine-apples are sufficient for the demand, and they are offered at nearly the same prices as mentioned last week. Hothouse Grapes continue to be supplied, but only in small quantities; they are selling at 15*s.* per lb. Good Apples are scarce, and have advanced a little in price since our last report; the best dessert varieties are offered at 28*s.* per bushel. Little alteration has taken place in the price of Pears. Oranges are abundant, and Lemons are sufficient for the demand; Chesnuts bring the same prices as last week. Vegetables begin to improve; Broccoli is good, and continues to get cheaper. Savoys are becoming very scarce, as are also Brussels Sprouts; the former has slightly advanced in price. Greens are still sufficient for the demand. Carrots and Turnips, of excellent quality, are abundant; they are not altered in price. Seakale and Asparagus are well supplied, and are good in quality; the latter is a little reduced in price. French Beans are sufficient for the demand. Rhubarb is good in quality, and very plentiful. A good many of the Syon-house Cucumber have been brought to the market lately, but they do not sell so well as either the Black or White Spine, which meet with a ready demand. Strawberries are good, and are becoming more plentiful. Frame Potatoes are offered at 3*s.* per lb. Cut flowers chiefly consist of Erica Willmoreana, E. Westcotii, Euphorbia jacquiniflora, Gardenias, Azaleas, Camellias, Pelargoniums, Cinerarias, Fuchsias, Primulas, Lily of the Valley, Mignonette, and Roses.

FRUITS.

Parsley, per doz bunches, 3*s* to 5*s*
Tarragon, Green, per bun. 3*d* to 5*d*
Endive, per score, 1*s* 6*d* to 3*s*
Green Mint, 4*d* to 9*d* per bunch
Marjoram, p. doz. bun. 1*s* 6*d* to 2*s*
Chervil, per punnet, 2*d* to 3*d*
Salsafy, per bundle, 1*s* to 1*s* 6*d*
Scorzonera, per bundle, 1*s* to 1*s* 6*d*

POTATOES.—Southwark Waterside, March 25.

The heavy gales of wind the early part of the week prevented the arrivals anticipated, and the cold north-east winds checked vegetation, which caused an extra demand for Potatoes, and a further advance on some samples was maintained. The Farmers having been fully employed with their field operations, they have not had time to ship, and our market still feels the hindrance to the shipping caused by the late snow-storm in the north and some the roads have been opened, many cargoes have been shipped to Yorkshire for plants. Several cargoes arrived from the northern districts the end of the week, yet the supply is moderate, especially for this season of the year. The weather became more genial the last two days, and the dealers only purchasing for present use, sales were languid at the annexed quotations:—

York Reds - - -	80s	to 90s	Kent and Essex Whites -	60s		70s
Perth - - - -	80	85	— — Kidneys -	80		85
Early Devons - - -	—	—	Wisbeach Kidneys - -	80		85
Late Devons - - -	90	—	— Blues - -	—		75
Cornwall - - - -	85	—	— Whites - -	65		70
Jersey and Guernsey Blues	80	—	Prince Regents and Shaws	65		80

WOOL.—British, Friday, March 29.

Our Wool Market continues quiet, and there appears a disposition to quit stock whenever it may be done at late quotations; but we do not think any reduction in price since our last can be quoted.

	per lb.			per lb.

Expenses of shipping about 5s to 7s per ton, according to quantity.

Mark Fothergill.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks, which are ornamental in appearance, can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. MR. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

BURBIDGE AND HEALY beg respectfully to inform the Horticultural world that they are quite ready to supply their new BOILER, of every size. They have now fixed a sufficient number to warrant them in stating that what they put forth as the qualities of their Boiler and Furnace arrangement may be perfectly relied upon: they have put up one at the Horticultural Gardens, where B. and H. believe it is considered to answer as represented; they have also fixed it in connection with a new description of Iron Tank, which combines the qualities of the round pipe and the open tank, which may be pronounced the perfection of a Heating Apparatus for Horticultural purposes, particularly for Graperies, Epiphyte-houses, Melon-pits, &c., &c. The arrangement is such that any gentleman or gardener may have the whole constructed so as to be put together with the greatest facility by the gardener, first sending a correct plan to 130, Fleet-street. A Prospectus may be had detailing the prices, &c.

COTTAM AND HALLEN, ENGINEERS, IRON-FOUNDERS, &c. &c., No. 2, WINSLEY-STREET, OXFORD-STREET, LONDON, and at CORNWALL-ROAD, LAMBETH.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices, in consequence of the present depressed state of the Iron Trade.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public, or Private Buildings, &c., with COTTAM'S PATENT, or ROGERS' BOILERS. After 15 years' experience, and having fixed upwards of 1500 Apparatus for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale. For the convenience of those who wish to fix their own Apparatus, they have affixed the following low prices:—

Cottam's Patent Boiler, 18 inch	£2 15s. 0d.
Rogers' Boiler, small size	1 17 0

Larger in proportion.

Hot-water Pipe, at 2, 3, and 4 inches, at reduced prices.

The TANK SYSTEM on an improved principle, that will heat the house at the same time, without pipes.

GARDEN ROLLERS 18 inches long, 34s.; 20, 44s.; 22, 50s.; 24 inches, 60s.; 26, 75s.; 28, 84s.; 30, 105s. each.

CAST-IRON RICKSTANDS, 2 feet six inches high, 5s. 9d. each.

Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and every description of Horticultural Articles, Agricultural Implements, and Furnishing Ironmongery; Dr. Arnott's Stoves, Anglo-Belgian Cooking Stoves; Broiling Stoves. The above low prices being on account of the depression in the Iron Trade, are subject to future alterations.

STRONG IRON HURDLES, 3 ft. high out of the ground, 6 ft. long, with five horizontal bars, weighing about 36 lbs., 3s. 6d. each.

Light Cattle Hurdles, 3 ft. 6 in. high, weighing	42 lbs.,	4 0	,,
Strong do. do.	do. 45 lbs.,	4 4	,,
Ox Hurdles, 4 feet high,	do. 60 lbs.,	5 6	,,

BEST WIRE, for STRAINED WIRE FENCING, at 8s. 6d. per bundle of 150 yards each. Uprights for ditto, 7d. each. The Improved continued, and every kind of Fencing, Fancy Wirework.

HAND-GLASS FRAMES for Cucumbers, &c., 18 inches square, 2s. 6d.; 20 inches, 4s. 6d.; 22 inches, 5s. 6d. each.

CAST-IRON FLOWER-STAKES, 4 ft. long out of the ground, 7s.; 4 ft. 6, 9s.; 5 ft., 11s.; 6 ft., 15s.; 7 ft., 20s. per dozen.

SHOW-ROOMS at the Manufactory, No. 2, WINSLEY-STREET, where every information may be obtained.

E. WEEKS, Sen., Hortulan-place, King's-road, Chelsea, the original Builder of Hothouses, Conservatories, &c. &c., Inventor and Patentee for Heating by Hot Water, begs to inform the Nobility, Gentry, and Public that he has great improvements for inspection, surpassing anything yet seen. Houses of all descriptions ready for fixing.

47, Lime-street, March 29, 1844.

TO GARDENERS AND AGRICULTURISTS.

SUPER-PHOSPHATE of LIME is capable of producing a more rapid vegetation in Plants than any substance known. It may be had at Mr. LAWES' Factory, Deptford Creek, price 7s. per cwt.

Phosphate of Potash,	15s. per cwt.
,, Soda,	12s. ,,
,, Magnesia	9s. ,,
,, Ammonia	1s. per lb.

THE URATE of the LONDON MANURE COMPANY, 5l. per Ton. It is with the greatest satisfaction, after three years' experience, the Company are enabled to recommend the above as one of the best manures for Barley, Oats, Spring Wheat, and more especially Turnips. By promoting a rapid growth of the latter it secures a full plant, at the same time producing a great weight per acre, and extending its beneficial effects to the succeeding crops. The Urate may be sown broadcast, or which is preferable, by the drill, at the rate of one ton to three acres, and it is desirable it should not be placed more than two inches below the surface. As a top-dressing for Wheat the Urate has been used with great advantage. Gardeners and Florists will find it very useful for Dahlias and other roots. Full particulars and Testimonials will be forwarded on application. Genuine Peruvian Guano; Phosphate and Sulphate of Ammonia; Gypsum and every other artificial Manure.

EDWARD PURSER, Secretary, 40, New Bridge Street.

GLASS SUPERSEDED for HORTICULTURAL PURPOSES by WHITNEY'S CHEMICAL TRANSPARENT WATERPROOF COMPOSITION, rendering Muslin, Calico, or Linen, for the Frames of Greenhouses, Pine, Melon, or Cucumber Stoves, &c., impervious to rain or moisture, admitting light equal to Glass, much warmer, and the plants never burn under it.

Noblemen, Gentlemen, and Gardeners will, by using this composition, have the only effectual protection for their Fruit-trees during the blooming season; it is a certain defence from frost, sleet, wind, and blight; its transparency admits the general beams of the sun, with abundance of light, which causes the bloom to expand with increased luxuriance, the fruit to set and swell more freely, much earlier, and a crop of fruit to any extent may be warranted. The covering not to be moved by day (except to thin the Fruit, which will be necessary), till the month of June. It is recommended that the Calico be prepared early, so as to be thoroughly dry before using.

Sold in Bottles, with directions for use, pints, 2s. 6d., quarts, 4s. 6d. each. One pint is sufficient to coat four Frames twice over, each Frame to be 5ft. by 3 ft. 3 in., or thereabouts. Prepared by GEORGE WHITNEY, Chemist, Shrewsbury, Seedsmen, Florists, and Merchants supplied by Mr. W. BAILEY, Chemist, North-street, Wolverhampton. Appointed Agents:—Messrs. BUTLER and MUCKLEY, Covent Garden, where a sample of prepared calico may be seen; Mr. WATKINSON, Market-place, Manchester; PAGE and SON, Southampton; T. and C. WHALLEY, Nurserymen, Liverpool.

Agents wanted for London and the country.

ASPHALTUM in its pure state, with all the material and instruction how to prepare, or if required, the labour performed at a moderate charge.

TOBACCO ASHES.—A few Tons of Tobacco Ashes to be Sold at 3l. per ton, convenient for land or water carriage.—Apply to J. A. HUBBARD and SON, 20, Harp-lane, Tower-street. All Letters prepaid.

SUPERIOR SUBSTITUTE FOR TARPAULIN, &c.

C. MACINTOSH & Co., having made a considerable reduction in the price of the Patent India Rubber Covers for Carts, Waggons, Ricks, &c., beg to call the attention of Users of Tarpaulin and Oiled Sheets to the superiority of their manufacture as an effectual protection against wet, not liable to crack on being folded, and more economical than any other Waterproof Cover.—22, York-street, Manchester; and 46, Cheapside, London.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

THE following Articles, manufactured in Slate for Horticultural purposes, may be seen in use at Worton Cottage, upon application to the gardener (Sundays excepted).

Tank Covers	Bottoms for Frames
Cisterns	Boxes for Balconies and Verandahs
Shelves	Orange Tubs, Flower Boxes, &c.
Garden Edging	

EDWARD BECK will be happy to answer any inquiries, either personally or by post.

TO AGRICULTURISTS.

THE Dry Material for making CAMPBELL'S CORN-PRODUCING LIQUIDS, or FERTILISING STEEPS, which have arrested the attention of Agriculturists in all parts of the United Kingdom, is now to be had in Boxes containing quantities for 5 Gallons and upwards, at the following prices:— For WHEAT, Material per Gallon ....2s. 6d.

,, OATS and GRASSES,	1 6
,, BARLEY,	2 0
,, BEANS and PEASE,	2 0
,, TURNIPS and RAPE SEED	2 6

Agents in London:—Mr. EDWARD PURSER, 40, New Bridge-st.; Messrs. GEO. GIBBS and Co., 26, Down-st., Piccadilly; and Messrs. THOMAS GIBBS and Co., Corner of Half-moon-street, Piccadilly.

LEVEL.—This Instrument, the invention of a Gentleman extensively engaged in Draining, is confidently recommended for its simplicity and cheapness; it requires only one person to use it, and gives the rise and fall in land as well as the level, and is also adapted for giving a uniform fall to drains. Each Level is packed in a case 18 inches by 3. Price, 2l. Direct to W. B. WEBSTER, Hounsdown, near Southampton.

DR. HALLETT'S LIQUID FERTILISER.—The beauty of Flowers, with their power of perfecting their Seeds, and the flavour and size of Fruits and Vegetables must ever depend upon the food supplied to the plants producing them; and these a very extensive series of trials on various soils has shown, may be secured by the use of Dr. HALLETT'S CONCENTRATED LIQUID FERTILISER, which contains all the essential ingredients of the best foreign Guano; with others equally so, but not to be found in the Atlantic Ocean. Sold by Messrs. WARNERS, 28, Cornhill; Messrs. WINSTANLEY, 7, Poultry; and every other respectable Chemist and Seedsman; with directions, in stone quarts, at 1s. 6d. each. The liquid requires 64 parts of water to reduce it for use, for watering soils and growing bulbs in.

MOST IMPORTANT TO FARMERS AND GRAZIERS.

GIBBONS' DISINFECTING OINTMENT, a most effectual and perfect cure for Epidemic and Foot-rot in Sheep; also for Epidemic and Foul in Cows' Feet, and for the Grease and Thrush in Horses; prepared only by HENRY GIBBONS, Agricultural Chemist, Wolverhampton.

This Ointment effectually destroys the American grub on Fruit-trees. Sold by all respectable Druggists in Town and Country, in packets at 2s. 6d. each. Mr. William Bailey, Manufacturing Chemist, North Street, Wolverhampton, is appointed Sole Wholesale and Shipping Agent.

AGRICULTURAL IMPROVEMENT.

SPRING WHEAT.—HUMPHREYS'S FARMERS' COMPOUND, manufactured on a *new principle*, so as to present a cheap manure of greater power, and more extensive usefulness, than the guano; and without its caustic rankness, and liability to be washed out of the soil. From its wholesome character, it is unrivalled for garden culture; and as a Top-Dressing for all Spring Crops. Per acre, for WHEAT, BARLEY, &c., with a bad soil, *Five cwt.*; with better land, *Three* or *Two*. GRASS on the average, *Two cwt.* TURNIPS, THREE or TWO. Price 12s. per cwt. Agents, DAVY, MACKMURDO, & Co., Manufacturing Chemists, 100, Upper Thames-street, London. Factory, Great George-street, Bermondsey.

CHOICE FLOWERS and PLANTS in POTS.

HUMPHREYS'S COMPOUND, applicable to all Greenhouse Plants, to Cucumbers, &c., and to promote the germination of Seeds. Sold in bottles at 1s. 9d. each, by Messrs. FLANAGAN & SON, Mansion-house-street; HURST & MCMULLEN, Leadenhall-street; W. CLARK, Bishopsgate-within; SMITH, Islington Nursery; GRIMLEY and Co., Covent Garden; BATT and RUTLEY, 412, Strand; WILLIAM and JOHN NOBLE, Fleet-street; SMITH, Covent Garden; CHARLWOOD, Tavistock-row; W. J. NUTTING, 46, Cheapside; G. LAWRENCE, 12, Piccadilly; JOHN KERNAN, Great Russell-street, Covent Garden; LOCKHART, 156, Cheapside; SHUTTLEWORTH, Pantheon; MINIER, ADAMS, and NASH, 63, Strand; THATCHER and SON, Islington; J. FRYER, Clarendon-terrace, Camberwell; THOMAS ANSELL, Camden Town; THOMAS WATKINSON, Market-place, Manchester; T. S. KING, Rochester; W. E. RENDLE, Plymouth; DICKSON and Co., Edinburgh; PONTEY, Leeds; FISHER, HOLMES, and Co., Sheffield; P. LAWSON and SON, Edinburgh; J. THORNE, Shepton Mallet; and other leading SEEDSMEN in town and country. Wholesale Agents, DAVY, MACKMURDO, and Co., 100, Upper-Thames-street, London.

100 CUCUMBER AND MELON-BOXES AND LIGHTS for Sale. One, Two, and Three-Light Boxes and Lights of all sizes ready for immediate use—best materials: packed and sent to all parts of the Kingdom by JAMES WATTS, Sash Manufacturer, and Hothouse Builder, Claremont-place, Old Kent-road. Garden Lights glazed and painted complete from 1s. per foot.

THE LATE MR. LOUDON.—The following Subscribers to the Works of the late Mr. LOUDON have been obtained since making up the list which appeared in the *Gardeners' Chronicle* of Saturday, March 16. A part of the following list should have appeared in the *Gardeners' Chronicle* of Saturday last, but it was unavoidably postponed for want of room.

THE LIBRARY OF TRAVEL.

On Saturday, the 30th of March, to be continued Weekly, price 4*d.*, the First Number of

THE LIBRARY OF TRAVEL: being a Popular Description of Foreign Countries, with Notices of Scenery, National Characteristics, Incidents of Wayfaring and Sojourn, Personal and Historical Sketches, Anecdotes, &c.—Abundantly Illustrated with Wood Engravings.—Edited by WALTER K. KELLY.

Each Weekly Number will contain Twenty full pages of letter-press, demy octavo, embracing such woodcuts as may be required to illustrate the Text. At the end of every month the Numbers will be collected into a Part, which will be issued with the Magazines; and the Parts treating of each country, or group of countries, as may be found most convenient, will be bound into volumes with separate title-pages.—SYRIA AND THE HOLY LAND WILL FORM THE FIRST VOLUME.

London: CHAPMAN and HALL, 186, Strand. Orders received by all Booksellers.

MR. YARRELL'S HISTORY of BRITISH FISHES. This Second Edition contains 37 new species not included in the First Edition, the whole number being now 263; 27 Fishes have been newly engraved, and 34 new Vignettes have been added. The Work now contains nearly 500 woodcuts. Two vols. 8vo, price 3*l.*

JOHN VAN VOORST, 1, Paternoster-row.

Now ready, with woodcuts, post 8vo, 12*s.*,

SCENES and TALES of COUNTRY LIFE, with Recollections of Natural History. By EDWARD JESSE, Esq., Surveyor of Her Majesty's Parks and Palaces.

JOHN MURRAY, Albemarle-street.

MAXWELL'S REBELLION in IRELAND, in 1798. Part IV., for April, price 1*s.*, with Two beautiful Designs on Steel, by GEORGE CRUIKSHANK.

"There will be found in it some most interesting matter relating to persons and things, which cannot fail to attract attention."—*Morning Advertiser*, Jan. 5, 1844.

"This Part is filled with records of the most stirring interest, connected with the melancholy period to which it refers. The dreadful scenes which marked the progress of the rebellion are illustrated by George Cruikshank; and Mr. Maxwell, we understand, has collected his detail of the rise, progress, and conclusion of those disastrous times from the most authentic sources. They are indeed of the most romantic and horrifying description."—*Bell's Life in London*, Jan. 6, 1844.

Now ready, 2 vols. 8vo, cloth boards, 1*l.* 4*s.*, Portrait.

WANDERINGS in the HIGHLANDS and ISLANDS, with Sketches taken on the Scottish Borders; being a Sequel to "Wild Sports of the West." By W. H. MAXWELL, Esq.

"The rapid, off-hand, dashing style of the author of 'Wild Sports' has the effect of rendering all his books agreeable..... Like Washington Irving, our old campaigner has a stout gentleman; and, verily, an admirable fellow he is, with a story enough to make the fortunes of half-a-dozen books, and clear out the wrinkles from the face of Old Care himself. We content ourselves by wishing our readers may laugh through Mr. Maxwell's pages as merrily as we did."—*Pictorial Times*, Jan. 20.

MAXWELL'S LIFE of the DUKE of WELLINGTON, K.G., in 3 vols. demy 8vo, bds., splendidly illustrated with Portraits, Battle Scenes, Plans of Battles, and Maps. Price 3*l.* 7*s.*, or with proof plates, royal 8vo, price 5*l.*, bound.

In 2 vols. 12mo, bound, 1000 pages, price 1*l.* 1*s.*, illustrated by 24 Steel Engravings from the most authentic Portraits of the British Admirals, and numerous Diagrams of Naval Actions,

THE BATTLES of the BRITISH NAVY, from A.D. 1000 to 1840. By JOSEPH ALLEN, Esq., of Greenwich Hospital. "The best and most complete repository of the triumphs of the British Navy that has issued from the press."—*United Service Gazette.*

BAILY'S SERIES of WINNERS.—The above series comprises Portraits of the Winners of the Derby, Oaks, and St. Leger for 1843—to be continued—besides Portraits of Beeswing, Charles the Twelfth, and Confidence, the celebrated American Trotter, price 1*l.* 1*s.* each. Also in course of publication, a splendid Portrait of Alice Hawthorn.

BAILY'S SPORTING ALMANACK for 1844, price 2*s.* 6*d.*, embellished by 12 highly-finished Illustrations.

DE LA VOYE'S NEW ENGLISH-FRENCH, FRENCH-ENGLISH LEXICON, 1100 pages, 10*s.* 6*d.* boards.

DE LA VOYE'S NOVEAU MELANGE. 12mo, boards, 4*s.* 6*d.*

DE LA VOYE'S NOUVELLES RECREATIONS FRANCOISES. 12mo, boards, 4*s.* 6*d.*

*** As no Advertisement could give a just idea of the variety and extent of the information contained in the above volumes, by M. DE LA VOYE, specimens will be sent, post paid, on applications to the Publishers, A. H. BAILY & Co., Cornhill, London.

NOW READY, price 1*s.*

PERUVIAN and BOLIVIAN GUANO, with Full PRACTICAL Instructions for its Use, and Testimonials of its Properties and Results.—JAS. RIDGWAY, Piccadilly, and every Country Bookseller. Also,

1. The Fourth Edition, enlarged, of Morton on Soils, price 10*s.*
2. Agricultural Chemistry for the Practical Farmer, by C. Squarey, 5*s.*
3. A New Edition of "Sinclair on Grasses." Coloured plates, price 30*s.*

CONSULTING ENGINEER.—James Smith, Esq. (Deanston.)
SOLICITORS.—Messrs. Blanchard, Richardson, and Gutch, York.
SECRETARY.—John H. Charnock, Esq., Wakefield.

This Association is formed for the purpose of affording to the Agricultural interest, by means of its collective capital, the funds necessary for the THOROUGH DRAINING OF LAND; and of executing and superintending the execution of the works required for this purpose on the most economical and effective principles—repayment of the money advanced to be made, with interest, by such equitable half-yearly instalments as in the several cases may be determined.

Among the various objects to which of late years collective capital has been more or less successfully applied, it is not a little surprising that the one which, of all others, offers the most certain and profitable return, with the soundest security, should have hitherto been almost disregarded. The time, however, has arrived, when an urgent desire for Agricultural improvement on the one hand, and a dearth of safe and profitable investment for superabundant capital on the other, renders such an Association highly desirable to both the landed and monied interest, whilst to the community generally an almost incalculable advantage will be secured by a proportionate increase of labour and food.

At a meeting of the council of the Yorkshire Agricultural Society held in York, on the 20th of December, 1843, a resolution was passed, approving generally of the objects of this Association, and at the monthly meeting of the Wakefield Farmers' Club held on the 8th January, 1844, a resolution approving of the principle and objects of the Association, was unanimously adopted.

At the meeting of the Royal Agricultural Society of England, at Liverpool, in July, 1841, Lord Stanley remarked—that "there was no bank in the whole country—no commercial speculation—no investment so safe, so sure and profitable, as that in which even borrowed capital may be engaged, by investing it under the ground of your own soil." And in reference to this Association, his Lordship, in a letter to the Committee says:—"I am fully satisfied of the benefits which such an Association is capable of conferring on the country, if confined to its legitimate object—the lending of capital on the security of an investment in draining; and I think it very probable that many landed proprietors would avail themselves of the facilities afforded by an institution lending money on land, repayable by instalments—a condition on which few private parties are willing to lend.

Bearing in mind the important objects of the Association, and the perfect security with which its operations can be conducted, at a comparatively trifling expense (no large expenditure for previous outfit being required), it may be reasonably expected that the return for the capital embarked will be such as to insure the support of prudent and permanent investors, thereby divesting it of that speculative character which has stigmatised so many modern projects, and which it is the especial desire of the Committee to avoid.

Application for prospectuses, and further particulars to be addressed to the Solicitors, Messrs. BLANCHARD, RICHARDSON, and GUTCH, York; or to J. H. CHARNOCK, Esq., the Secretary, Wakefield.

NATIONAL MERCANTILE LIFE ASSURANCE SOCIETY, ARTHUR-STREET WEST, LONDON BRIDGE. (Established in 1837.)

Directors.

Chairman.—Robert Currey, Esq.

Edward Baker, Esq. — Thomas Bax, Esq.
Jasper Capper, Esq. — Joseph Cooper, Esq.
Thomas Dakeyne, Esq. — Russell Jeffrey, Esq.
Geo. Redmayne, Esq. — William R. Spicer, Esq.
James Spicer, Esq. — Joseph Sterry, jun., Esq.
Henry Sterry, Esq. — Robert Wilcoxon, Esq.

Bankers.—Messrs. Prescott, Grote, and Co.

ADVANTAGES.

A BONUS of two-thirds of the Profits allotted to the Assured.
LOWER RATES OF PREMIUM charged for Assurances without profits.
PREMIUMS payable Annually, Half-yearly, or Quarterly.
ASSURANCES OF EVERY DESCRIPTION may be effected. Among others, the important one, *originated by this Society*, of securing a sum to the Assured himself on his attaining any given age, or to his family *in the event of his earlier death.*
A POCKET DIARY containing detailed particulars, may be had on application at the Office, or of the Society's agents.

JENKIN JONES, Actuary and Secretary.

LONDON, EDINBURGH, and DUBLIN LIFE ASSURANCE COMPANY, No. 3, Charlotte-row, Mansion House; and 18, Chancery-lane, London.

This is the only Company who are bound by their deed of constitution not to dispute any Policy, unless they can prove that it was obtained by fraudulent misrepresentation; and nothing but fraud proved to have been committed against them can vitiate a Policy granted by this Company.

This is the only Company from whom the assured on the mutual principle receive the whole of the mutual accumulations, and also a guarantee from the Shareholders for the sums assured.

This is the only Company who bind themselves to pay the sums in the Policies, although the debts for which they were effected shall have been liquidated before the claims arise.

This is almost the only Company who grant in favour of creditors *World Policies*, whereby the debt is secured, although the assured should go beyond the limits of Europe.

The half-premium plan only one-half of the premiums for the first seven years is required, the other half being payable at the convenience of the assured; thus allowing a Policy to be continued for seven years at one-half of the usual rate, or to be dropped at one-half of the usual sacrifice.

ALEX. ROBERTSON, Manager.

DISEASED AND HEALTHY LIVES ASSURED.

MEDICAL, INVALID, and GENERAL LIFE OFFICE, 25, Pall Mall, London.—This Office is provided with very accurately-constructed Tables, by which it can Assure Diseased Lives on Equitable Terms. Increased Annuities granted on *unsound* Lives, the amount varying with the particular disease. Members of Consumptive Families Assured at Equitable Rates.

E. G. P. NELSON, Actuary.

PROVIDENT LIFE OFFICE, 50 REGENT STREET, FEB. 15, 1844.
BONUSES DECLARED, 529,305*l.* 17*s.* 7*d.*

NOTICE is hereby given, that all Persons who hold Policies in this Office, bearing date prior to the year 1834, may receive the present value of the Bonuses which have been added to their Policies, upon application at the Head Office, or to the Agents through whom the Policies were issued.

GEORGE BEAUMONT, Actuary.

GREAT BRITAIN MUTUAL LIFE ASSURANCE SOCIETY, 14, WATERLOO-PLACE, LONDON.

Directors.

The Chisholm, *Chairman.* — Wm. Morley, Esq., *Deputy-Chairman.*
John Brightman, Esq. — James John Kinloch, Esq.
Francis Brodigan, Esq. — Henry Lawson, Esq.
James William Deacon, Esq. — Robert Power, Esq.
Jonathan Duncan Dow, Esq. — The Reverend F. W. Johnson Vickery, A.M.
Alexander Robert Irvine, Esq.
John Inglis Jerdein, Esq.

Auditors.

C. B. Rule, Esq.—T. C. Simmons, Esq.—George Thomas, Esq.
Physician.—John Clendinning, M.D., 16, Wimpole-street.
Solicitor.—Walter Prideaux, Esq., Goldsmiths' Hall.
Bankers.—Union Bank of London.

ADVANTAGES OF THIS INSTITUTION.

The whole of the Profits divided ANNUALLY among the Holders of Policies on which five Annual Premiums shall have been paid.

Credit given for half the amount of the first five Annual Premiums, by which means Assurances may be effected and loans for short periods secured with the least possible present outlay; and after payment of the arrears, the Policy-holder will become entitled to participate in the entire profits of this Institution, precisely in the same manner as if he had paid the whole amount of his Premiums in advance in the usual way.

Thus, for example—a person in the 25th year of his age, instead of paying 2*l.* 6*s.* per annum for an Assurance of 100*l.*, would be required to pay 1*l.* 3*s.* only during the first five years, when, on payment of the arrears of Premium, amounting to 5*l.* 15*s.*, his share of the profits would be such as to reduce his future Annual Premiums to very little more than the half Premium of 1*l.* 3*s.* originally paid by him. The GREAT BRITAIN is the only Mutual Assurance Society in which this very great accommodation is given to the Assured.

Credit allowed for the whole of the first five Annual Premiums on satisfactory security being given for the payment of the same at the expiration of five years.

Transfers of Policies effected and registered (without charge) at the Office.

Claims on Policies not subject to be litigated or disputed, except with the sanction, in each case, of a General Meeting of the Assured, to be especially convened on the occasion.

Holders of Policies of 1000*l.* entitled (after payment of five Annual Premiums), to attend and vote at all General Meetings of the Assured, who will have the superintendence and control of the funds and affairs of the Society.

Full particulars are detailed in the Prospectus, which, with every requisite information, may be obtained by application to

A. R. IRVINE, *Managing Director.*

THE IRISH FARMERS' GAZETTE and HORTICULTURAL JOURNAL. Edited by EDMUND MURPHY, A.B. T.C.D., Landscape Gardener and Improver of Estates, &c.

This Paper was commenced in May, 1842, and having been adapted to the circumstances of Irish Farming—now in a transition-state from the worst to an excellent system—not only points out the best practice, but, giving plain instructions how every operation should be performed, is now recognised as the ORGAN of AGRICULTURAL IMPROVEMENT in IRELAND, where the advantages which have already resulted from it are universally recognised. The result of practices recommended, and of experiments on all subjects connected with the improvement of land, and the increase of its produce, are freely communicated to the Editor and recorded. Selections of the most practically useful articles are made from the various works on farming with which the press now teems, and utterly eschewing politics—so long the bane of the Irish Farmer—and devoting its columns exclusively to Agricultural and Horticultural improvement.

THE FARMERS' GAZETTE has the distinguished honour to be stamped with the approbation of those eminent individuals, Wm. Blacker, Esq., James Smith, Esq., of Deanston, and the late Mr. Loudon, and is received with such confidence that the practice of having its contents read at stated periods to assembled farmers is becoming general. The circulation of the IRISH FARMERS' GAZETTE has of late been extending even in England and Scotland, where, up to this period, no effort has been made to bring it under notice, but where the principles of good husbandry being everywhere the same, it is calculated to be equally useful as it has been found to be in Ireland. The most practically useful essays on Farming are, from time to time, struck off for distribution in the shape of TRACTS FOR FARMERS, and have been very extensively circulated, viz.:—On the Dairy—A Catechism of Thorough Draining and Sub-soiling—The Culture of Flax—Management of Manure and Green-Cropping and House-Feeding, are nearly ready. Also, on the 1st Jan. was published, the "Irish Farmers', Gardeners', and Foresters' Almanac."

THE IRISH FARMERS' GAZETTE is published every Friday, at 22, Bachelor's Walk, Dublin, and goes free by post. Annual subscription, 16*s.*, half-yearly, 8*s.*, payable in advance; and orders directed to the publisher are immediately attended to.

The portions of the FLORAL REGISTER and AUCTARIUM, already published, contain nearly Twelve Hundred Engravings, forming one handsome volume, which will be delivered GRATIS to the purchaser of four volumes of the BOTANIC GARDEN.

GROOMBRIDGE, Paternoster row.

News of the Week.

THE decision of the House of Commons on Friday night on the 10 hours clause of the Factories Bill—by which both the Government and Lord Ashley were left in a minority, has so far embarrassed the question that the introduction of a new Bill has become imperatively necessary. Our readers are aware that on Monday week the House, by two successive divisions, virtually sanctioned Lord Ashley's proposition of 10 hours, in opposition to the 12 hours clause proposed by Ministers. On Friday night Ministers attempted to induce the House to reverse this decision, and were again defeated, their motion that female labour should be restricted to 12 hours having been negatived by a majority of 3. Immediately afterwards, however, the counter-proposition of Lord Ashley, stipulating for a restriction of labour to 10 hours was defeated by a majority of 7, although it was the identical proposition which the House on Monday had affirmed by a majority of 9. The general excitement which followed this result, and the importance of the interests which it affects, induced Sir J. Graham to postpone till Monday the announcement of the course he would pursue in the future management of the Bill. On Monday, therefore, he stated that Government would neither consent to a compromise, nor leave the law as it now stands, but would move to rescind the order of the day by which the Committee on the disputed Bill was constituted, and would immediately bring in a new Bill. He stated, however, that while this new measure will contain such provisions as are likely to receive the sanction of the House, the Government are still determined to resist all limitation of the hours of labour to less than 12 hours. Lord Ashley announced that he would not oppose the withdrawal of the Bill, but it is understood that his Lordship will again take the sense of the House on the 10 hours clause when it is discussed in detail after Easter.

From France we learn that the recent decisions of the House of Commons on the Factories Bill have been the general topic of conversation. The prevailing impression in Paris was one of surprise at the defeat of Government, the Ministerial papers describing it as a triumph of the philanthropic party which carried Negro Emancipation, and the Opposition papers regarding the restriction of labour as a certain precursor to a fall in wages, and to increased difficulties among the working classes.—A telegraphic despatch from the Spanish frontier announces the arrival of Queen Christina at Madrid, on the evening of the 23d. The meeting of Queen Isabella with her mother took place at a short distance from

the capital and their entry was welcomed by the acclamations of the people. The sanguinary measures adopted by the Government troops for the suppression of the late rebellion are still pursued without mercy, and fresh executions are reported from Alicante and Barcelona.—From Germany we have the important news that the King of Prussia, after so long resisting the attempts of Russia to obtain a renewal of the treaty for the mutual surrender of deserters, has now given his full adhesion to that measure by the renewal of the Convention.—The accounts from Italy are again assuming an alarming aspect. Disturbances have broken out in the kingdom of Naples, and the Papal States are almost in open insurrection. It is generally believed that a simultaneous rising is now secretly organising, and that an outbreak may shortly be expected.

Home News.

COURT.—The Queen held a drawing-room, the first this season, on Monday, at St. James's Palace, which was very numerously attended. On Tuesday, the Queen of the Belgians arrived at Woolwich from Ostend, and immediately proceeded to Buckingham Palace on a visit to her Majesty. On the same day, the Queen Dowager, accompanied by Prince Edward of Saxe Weimar, arrived at Marlborough-house from Witley Court. On Thursday Prince Albert, attended by Colonel Bouverie and Mr. G. E. Anson, left town for Germany, on a visit to his relatives at Gotha. His Royal Highness proceeded direct to Dover, where he embarked for Ostend, after a delay of two hours, occasioned by the state of the tide. The Prince was met at Ostend by the King of the Belgians. His Royal Highness passed the night at Ostend, and proceeded yesterday by railroad to Cologne, where he was to remain for the night, and then travel without intermission to Gotha, which he expects to reach to-morrow morning. Arrangements are making at Windsor for the arrival of her Majesty and the Royal Family on Tuesday next. Her Majesty will be accompanied by the Queen of the Belgians, and remain at the Castle until the return of Prince Albert from the Continent. His Royal Highness's absence will be as brief as the length of the journey will admit; as, in the event of no unforeseen obstacles arising, his Royal Highness fully intends to be in England by the 10th or 11th of next month.—It is the intention of the Duchess of Kent shortly to proceed to Paris, where she will remain a few days, *en route* for Switzerland, on a visit to her sister, who will pass some months there. The departure of her Royal Highness is postponed until the return of Prince Albert.—The Countess of Dunmore has succeeded Viscountess Jocelyn as the lady in waiting; Lord Rivers has succeeded the Marquess of Ormonde as the lord in waiting; and Colonel Drummond has succeeded Sir F. Stovin as the groom in waiting on her Majesty.

Parliamentary Movements.—The nomination of candidates for the representation of Hastings took place on Thursday. Mr. Musgrave Brisco was nominated as the Conservative candidate, in opposition to Mr. R. R. R. Moore, of the Anti-Corn-law League. Dr. Sleigh was also proposed, but declined going to the poll. The show of hands was declared to be in favour of Mr. Brisco; a poll was then demanded by Mr. Moore.—The election for Christchurch has terminated in the return of Captain Harris, the Conservative candidate. The numbers were—for Captain Harris, 180; for Mr. W. Tice, 84. Mr. Harvey, the League Candidate, resigned before the nomination in favour of Mr. Tice.—It is expected that Mr. Scott Murray, who has embraced the Roman Catholic faith, will resign his seat for Bucks, for which county he was returned at the election in 1841. It is not supposed that Mr. Murray will vacate his seat until the Marquess of Chandos is of age, which will be in September next, when the son of the Duke of Buckingham will offer himself to the electors as a candidate, in the room of Mr. Murray.

The Navy.—It is stated by an evening paper that Sir Joseph Douglas, whose name has been frequently before the public as the captain of a merchantman, knighted by Her Majesty, at the recommendation of the late Government, for placing his ship at the service of Government at the commencement of the war with China, is about to have the rank of Commander of the Royal Navy conferred upon him, and to be appointed to the situation of Master Attendant at Deptford Dockyard.

Royal Marines.—It is said that an extensive retirement among the Commandants, field Officers, and Captains of the Royal Marines has been determined upon, which will give about 30 steps to the junior branches of that distinguished service.

Post Office.—It is said that the Postmaster-General, now Earl of Lonsdale, intends to relinquish his office so soon as arrangements can be made for the appointment of his successor.

The Colonies.—Lord Stanley has cancelled the appointment of Commander Norcott, as Governor of the Gambia, and the Admiralty have despatched a vessel to recall him.

Foreign.

FRANCE.—The late decision of the House of Commons on Lord Ashley's motion has excited great interest in Paris. The Ministerial *Debats* discusses it as follows:—"This, if we are not mistaken, is the first time since its accession to power that the Ministry of Sir Robert Peel has found itself in a minority. It is certainly not the first time that it has met with serious opposition, for last year it was obliged to yield to public opinion, and withdraw one of its most important measures—that concerning the education of children in manufactories; but this is the first serious check it has received in Parliament, and which all the influence of its chief was inadequate to prevent. In this vote there was a perfect change in the usual position of parties. The agriculturists took pride in voting for a measure which would make great modifications in manufacturing labour; it was also a triumph for the philanthropic party, so strong in England from the influence it has out of Parliament. This party, as we have more than once observed, has often proved itself more powerful than the Government, and has dictated laws to the Legislative body. It was this party that carried the emancipation of the negroes, and caused the conclusion of the treaties on the right of search, which it still upholds. The vote we are now speaking of is a new example of its great influence." The *Constitutionnel* says, "It is the first defeat that the Cabinet has experienced, and this defeat was natural because the Ministry were wrong. Looking at the question on the score of humanity, undoubtedly Sir R. Peel was wrong. But such a reduction in the hours of labour will have a serious influence on the manufacturing produce of England, without its being certain that the position of the factory workmen will be improved. A reduction in the hours of labour will produce a reduction in wages, and will consequently but increase the difficulties of the working classes. What is remarkable in this vote is that politics were removed to the second line, and that the defenders of the interests at stake laid aside all other objects of consideration." The opposition papers generally applaud the result of the division, not so much from considerations of humanity as from the assumption that the vote will inflict serious injury on the manufacturing interests of this country.—The proceedings in the Chamber of Deputies this week, present few topics of interest to the general reader. On Saturday discussions took place in the committees of the Chamber upon three propositions, the objects of which are to check bribery and fraud at elections, to abolish the stamp duty on newspapers and periodical publications, and to alter the rules of the Chamber in such way that the presence of a hundred Members may suffice to vote the articles of a Bill, instead of the number of two hundred and thirty now required. Upon the first proposition a commission was appointed in the selection of which the Ministry prevailed by a large majority. Much discussion took place on the subject, Marshal Sebastiani, the late Ambassador in London, asserting that elections were nowhere so pure as in France, whilst in England bribery and fraud were openly practised, despite of laws far severer than the one which was contemplated. As regards the two other propositions, the reading of them in a public sitting was authorised. The Deputies also met to dispose of various petitions, when one was rejected, praying that the law banishing the Buonaparte family be revoked, and that Prince Louis be suffered to reside on his parole in the town of Ham or the environs. On Monday, M. Berryer took the oath on his re-election to the Chamber. Six members of the Conservative party, St. Marc Girardin, St. Aulaire, son of the French envoy in London, D'Haussonville, and others, have presented a law, forbidding any one to be appointed to a Government employment without previous examination, and regulating promotion afterwards.—We noticed in our last the reply of the Minister of Public Worship to a memorial submitted to the King by the Archbishop of Paris and his suffragans, reflecting upon the immoral and irreligious tendency of the system of University instruction. The Archbishop of Paris has published a rejoinder to the Minister, in which he demands that the 4th article of the concordat of the year X. (of the French Republic), which forbids that any synod, or meeting of diocesans or clergy, for the purposes of deliberation take place without permission from Government, be abrogated. After copying this letter, the *Journal des Débats* shows—from legal authorities and from the assent of the Court of Rome—that this demand is unreasonable, and that compliance with it is inexpedient, for that, if acquiesced in, its consequences would be to establish a State within a State, and to grant to the church a special code and privileges independent of the Government.—The lists of subscribers to the "sword of honour" to be presented to Admiral Dupetit Thouars continue to be published from day to day, and from the *National* of Saturday it appears that the amount subscribed at its office up to that date was 6432f. 15c. Fifty-one Parisian and provincial journals have opened lists for subscriptions; so that the total amount must be a tolerably large one. At Nancy and several other places the National Guards have subscribed. It is said that the Opposition at Cherbourg intend to support the Admiral as candidate for the seat left vacant in the Chamber of Deputies by the death of Colonel Bricqueville.—The *Moniteur* announces that Rear-Admiral Laplace has been appointed to the command of the station of the Antilles, in place of Rear-Admiral Moges; Rear-Admiral Hamelin has been appointed to the command of the station of Oceania, and the western coasts of America, in place of Rear-Admiral Dupetit Thouars, and Rear-Admiral Turpin is appointed Major-General of Marine at Toulon, in place of Rear-Admiral Hamelin.—The same paper contains a Royal ordinance, raising M. Gabriel Delessert, Prefect of Police of Paris, to the dignity of Peer of France, "in consideration of the services he had rendered to the State."—The *Courrier Francais* announces that Lieutenant-General Piré, who was lately superseded in the command of the 9th military division for having published the correspondence that had passed between him and the Minister of War, has been ordered to repair to Lille, and constitute himself a prisoner for two months in the military prison of that city.—The *Siècle* contends that the military conspiracy lately discovered must have been much more formidable and extensive than the Government wished the public to believe; and that near 300 non-commissioned officers and privates of the 70th Regiment of the Line have been sent to Algeria, in consequence of that mysterious affair.—In the *Journal des Débats* of Saturday there is an article from which it appears that the French Government had determined to take immediate and active steps towards the completion of no less than five great lines of railroad—from Paris to Lyons, from Paris to Bourdeaux through Tours, from Paris to Strasburg, from Paris to Nantes, and from Paris to the frontiers of Belgium, to a branch to Boulogne, and another to Calais. These great undertakings will amount, together, to nearly 1500 English miles.—Lieutenant-General Count Pajol, Peer of France, died on Wednesday week. He was 72 years of age, and had been in the army 53 years. He owed his elevated rank solely to his courage and military talents. He was aide-de-camp to Kleber at the battle of Altenkirchen, who conferred on him the rank of field officer on the field of battle. He was promoted to the grade of colonel by Massena, at the battle of Zurich. His commission of general was dated from Austerlitz, and that of general of division from Moscow.—By the death of the King of Sweden, Marshal Soult has become the sole survivor of all the 18 Marshals of the Empire created by Napoleon in 1804, at the camp of Boulogne.—The Prince of Canino (Charles Bonaparte) and Sir Benjamin Brodie were elected on Tuesday week corresponding members of the Royal Academy of Sciences at Paris, Prince Canino for the zoological, and Sir Benjamin Brodie for the surgical section.

SPAIN.—Our accounts from Madrid are of the 21st inst. The slaughter still continued in the province of Alicant, where no less than 35 persons had already been shot, without even the semblance of a trial, and 65 more were to undergo the same fate. The secretary of the political chief, who happened to be in Alicant at the time when the insurrection broke out, and who was forced to remain there, has also been shot by General Roncali's order, without the semblance of a trial. The unfortunate man died, protesting that he had never, in any way, joined in the operations of Bonet and his partisans. The Government papers publish pretended revelations of Bonet's, but they are of the vaguest character, and mention no names, but hint that there are persons compromised in the late revolt of standing and importance to the country.—General Roncali writes from his head-quarters, before Carthagena, on the 15th, that the rebels were making strenuous endeavours to maintain themselves in the place, and that he was awaiting the arrival of the siege artillery to attack it. Some sharp fighting is stated to have subsequently taken place in the neighbourhood of the city. The insurgents seemed determined to make a stout defence; they had unpaved the streets, and kept up a continual fire from Atalaya Castle. A Carlist conspiracy is said to have been discovered by the authorities at Tafalla, and to have been promptly suppressed, but no particulars are given. By accounts from Barcelona of the 17th we learn that several persons, including some females, were arrested in that city on the 11th, 12th, and 13th, on a charge of conspiracy against the Government. Four of the male prisoners were tried by a military commission, and shot on the 18th, in the presence of an immense crowd.—Maria Christina quitted Valencia on the 15th. A magnificent album had just been presented to her, containing various tributes paid to her by the southern poets. On her arrival at Valencia a number of young men went out to meet her in a boat, and then preceded her vessel, scattering flowers over the sea, and over the landing-place. The same homage was done her until she entered the palace prepared for her reception. The first interview of the Queen and her two daughters took place in a tent pitched on the Ocana road, two miles beyond Aranjuez; and her Majesty entered Madrid on the 23d, at 5 in the evening, amidst the acclamations of the people. Her favourite and chamberlain, M. Munoz, to whom it is said her Majesty is secretly married, has been raised to the peerage by the title of Duke of Rianzores, with the rank of a grandee of the first class.

PORTUGAL.—The Madrid papers state that a despatch had been received from Almeida by the Captain-General of Galicia, announcing the surrender of that city. The Queen, according to the same despatch, had amnestied the 600 men of the garrison, and ordered that passports be delivered to the insurgents who called for them.

GERMANY.—The Berlin papers announce that the Prussian Government has completed its full adhesion to the Russian, by the renewal of the Cartel convention, which stipulates the restitution of all deserters to Russia.—Some of the German papers announce that the project for a matrimonial alliance between the Russian and Austrian Imperial families has been abandoned, because the Emperor of Austria refused to accede to the *sine qua non* of the Emperor Nicholas, that the children to be born of the proposed marriage of the Archduke Stephen of Austria, with the Grand Duchess Olga of Russia should be christened and brought up in the religion of the Greek Church. Other accounts state on the contrary that the difficulty was of a purely political character. The Emperor Nicholas offered to raise the dower of his daughter to 4,000,000 silver rubles, and a permanent annuity of 100,000 ducats, provided the Archduke Stephen should be created Hereditary Palatine of Hungary, which was to become a separate state. Prince Metternich, and under his advice the Emperor and Empress of Austria, acquiesced in this proposition, but the Austrian aristocracy regarding the matter as a dismemberment of the empire, made such representations that the match was broken off.—It is said that letters have been received from Goritz announcing a marked improvement in the health of the Duc d'Angoulême.

ITALY.—Letters from Naples of the 17th inst. announce the arrest of Messrs. Bozelli and De Augustinis, two distinguished jurisconsults and literati, of M. Charles Poerio, the son of the celebrated deputy and orator of the Neapolitan Parliament of 1820, and of two nephews of General Pepe, one of the first families in the kingdom. The charge against these persons is that of having promulgated liberal opinions and advocated the establishment of a constitution. According to a letter from Leghorn of the 16th inst. it was reported that the King of Naples intended to give a constitution to his subjects. "But," says the writer, "it is generally believed that this is a *ruse* of the Neapolitan Government to deceive the Liberals, and put a stop to events which it is apprehended are about to take place. The situation of central Italy is becoming every day more critical: and secret agitation prevailing in the Legations has induced Cardinal Spinola, the Legate of Bologna, suddenly to resign his post. Naples and Sardinia are actively increasing their navies, under the pretence of the difference existing with Tunis."—The precarious state of Italy is still further confirmed by subsequent accounts, which state that a revolt had occurred at Cosenza, in Calabria, between the people and the troops. The former had attacked the residence of the prefect and the barracks, and several lives had been lost on both sides. The conflict was not over when the messenger, bearer of the news, left Cosenza. The King had ordered the immediate departure of reinforcements for Sicily, and the authorities of the island had been instructed to keep up a close surveillance along the coast, particularly along the Straits of Messina. In addition to these occurrences, letters from Paris refer to the receipt of accounts from Smyrna of the 9th inst., which mention a strange occurrence there that was held to have some connection with the plots said to be in existence for revolutionising Italy. Those accounts state, that on the 29th ult. the son of the Austrian Admiral Bandiera, commanding the naval station of the Levant, and who was aide-de-camp of his father, suddenly disappeared from Smyrna, and that down to the date of those accounts he had not been heard of. He was known to have left in an open boat, accompanied by one servant, and was reported to have fled because of his being implicated in the society or conspiracy called *La Jeune Italie.*

GREECE.—The *Greek Observer* of the 10th inst. states, that the moment the last article of the constitution was voted by the assembly, *vivas* in favour of the constitution and the King resounded through the hall and in the galleries reserved to the public, and all the assistants waved their fez and hats in the air in token of joy. Soon after, the crowd, preceded by the bands of the garrison, repaired to the palace, and the King and Queen having appeared at the balcony, were saluted with enthusiastic acclamations. His Majesty thanked the people, and said, "I rejoice with you at the completion of the constitution." The citizens afterwards proceed in succession to the houses of Colonel Kalergi, and of the principal leaders of the revolution of the 3d of September, and loudly cheered them. In the evening all the coffee-houses were illuminated, and public order was not an instant disturbed. The next day the charter was read again in the assembly, and some alterations in the diction were made. A deputation of 24 members was then chosen to carry it immediately to the King. M. Mavrocordato, its President, presented it to his Majesty, who replied:—"Gentlemen, I receive with pleasure the draught of the constitution, and feel bound to express to you my satisfaction for the wisdom you have exhibited, and your devotedness to me and my Royal Consort. Being anxious to do everything in my power to promote the prosperity of the nation, I will attentively examine that draught, and lose no time in communicating to the Assembly the result of my observations."

RUSSIA.—The German papers state that the Russian army in the Caucasus has recently experienced many reverses, arising principally from the improved state of discipline amongst the hardy mountaineers, who are defending themselves against the invaders. It appears that several Poles, of military experience, have succeeded in joining the Circassians, and giving to them the aid of their tactics. Accounts from Wilna state that in order to avoid giving the Government any pretexts for adopting rigorous measures against the Jews, the Rabbins of the frontier governments have put up a notice, declaring that every Jew engaged in smuggling should be read out of synagogue. All Jews aware of such acts are to inform against the persons engaged in them, under pain of being subjected to the same penalty. This threat it is said will be attended with benefit, as the Polish or Russian Jews fear spiritual punishment more than the knout.

SWEDEN.—Letters from Stockholm of the 12th, state that on the previous Saturday King Oscar was proclaimed amidst the enthusiastic cheers of the people. After this the garrison assembled in front of the palace, and the King, with the Duke of Upland, appeared on horseback. The King took from each regiment the oath of fidelity. He addressed the soldiers, who loudly cheered him; wherever his Majesty appeared, he was received by the people with the most unequivocal marks of affection and attachment. The marine has also taken the oath of allegiance. The opposition papers attest that the public have the greatest confidence in the new King, and that a perfect calm is manifest among all classes. It has also been observed with satisfaction that no such extraordinary precautions are taken as at the death of King Charles XIII., when chains were drawn before the palace, the custom-house shut up, &c. On the contrary, the people passed to and fro through the palace court-yard till night, when the gates are usually closed. The King has made a declaration in the Swedish Council of State, in which he solemnly promises to govern the kingdom according to the strict letter of the constitution, and to do his utmost to promote the good of the kingdom, and of each of its inhabitants. His Majesty afterwards made the same declaration in the Norwegian Council of State. It is said that his late Majesty has not left any will. Count Brahe, the Lord Chamberlain, did not undress during the whole time of the King's sickness, and had no other rest than what an arm-chair at the King's bedside afforded him; notwithstanding this extraordinary fatigue, he was, on the morning after his Majesty's decease, seen at the head of his regiment taking the oath of allegiance.

UNITED STATES.—There have been several arrivals this week, by which we have accounts from New York to the 6th inst. Congress and the people can scarcely be said to have yet recovered from the shock experienced by the fatal calamity on board the Princeton. The funeral of all the deceased—a public one—took place at Washington, every place in the city being closed on the occasion. It is remarkable that the life of President Tyler was placed in imminent danger on returning from the ceremony, in consequence of the horses attached to his carriage taking fright and running away. A similar accident occurred to the carriage of the French minister, but happily no personal injury was received. The horses were probably terrified by the firing of cannon. Several of the newspapers have stated that the gun which burst was manufactured in England, but the rumour has been contradicted. The English-made gun was on board; but the fatal monster cannon, which produced such destruction, was made at a foundry near New York. It was 15 ft. long, had a bore of 12 inches diameter, weighed 10 tons, carried a ball of 230 lbs., and required 45 lbs. of powder for a full charge. —The President has appointed, *pro. tem.*, the Hon. J. Nelson, Attorney-general of the United States, to the office of Secretary of State, and Commodore Warrington, Chief of the Bureau of Yards and Docks, to that of Secretary of the Navy, vacant by the melancholy accident on board the Princeton. In communicating the event officially to the House of Representatives, the President expresses his deep grief and regret, and entirely acquits the officers and crew of the ship from any blame. It is hinted that Mr. Upshur's office will probably be offered to Mr. Calhoun.—Letters from Havanna state that there have been negro insurrections on six estates at Cardenas, Cuba. Many lives were lost, but the Government suppresses all the particulars. "The insurrection," says a private letter, "is a concerted movement. Planters and overseers are flying into the cities. Many whites have been killed; some of the overseers have been boiled to death in sugar-coppers. Houses have been burnt, and the revolt is spreading."

WEST INDIES.—The Severn West India packet has arrived with papers from Jamaica to the 24th February, and from the other islands to a corresponding date. Their contents, however, prove of an uninteresting character, being chiefly filled with extracts from English journals. At Jamaica the crops had suffered materially from the want of rain, and at Trinidad the same complaints are made. Barbadoes appears to have been visited with rather plentiful showers, but the season having far advanced, it was feared that the benefit to the plantations would be limited. The accounts on the subject of trade vary, but hopes are expressed in favour of improvement.

Parliament.

HOUSE OF LORDS.

Monday.—Lord BROUGHAM took the opportunity of presenting a petition from certain females employed in the coal and ironstone mines in Lanarkshire, to condemn what he called the "cheap humanity," the "vicarious generosity," and the "short-sighted, one sided humanity," which at present appear to have taken possession of one branch of the Legislature. His Lordship strongly declared his opinion against any limitation of the hours of labour in factories. It was flying in the face of Providence; and it would be grossly inconsistent, unless they went on to prohibit employment in all deleterious occupations. They might as well legislate that only a certain amount of wages should be paid. He hoped that Parliament would well consider before they listened to the humanity doctrines of the day on matters so vitally important to the country.—The Bishop of EXETER moved for papers relating to the case of Mary Miller, an unfortunate woman, who had committed suicide in the Penzance union workhouse about three years ago, for the purpose of showing the violence and want of care which had been shown towards her by the master and board of guardians, and which had driven her to self-destruction.—Lord WHARNCLIFFE had no objection to produce the papers, but thought, as the board of guardians had since been changed, it would now be useless to do so. He did not deny the facts as stated by the Right Rev. Prelate.—The Marquess of LANSDOWNE moved for a copy of a communication made by the Penzance board of guardians to the Poor-Law Commissioners, relating to the appointment of a chaplain to the workhouse.—The previous motion having been withdrawn, this was agreed to.

Tuesday.—The International Copyright Amendment Bill and the Annual Indemnity Bill were read a first time. The House went into Committee on the Ecclesiastical Courts Bill. On the 8th clause, which continues the Diocesan Courts, Lord COTTENHAM moved that it be struck out, as these courts had been condemned by all the Committees of Inquiry, and were quite inefficient for the due administration of justice.—Lord CAMPBELL supported the amendment.—The LORD CHANCELLOR denied that the Diocesan Courts were inefficient; and Lord BROUGHAM admitted them to be bad, but thought they might be improved by this bill.—Their Lordships divided—Contents, 47; Non-Contents, 20; Majority, 27.—The clause was ordered to stand part of the Bill. The remaining clauses, with the exception of the 67th and 70th, and from 82 to 90, were agreed to with amendments.

Thursday.—A desultory conversation arose respecting the Irish state trials, with reference to the extent and character of the discussion which is to ensue on the presentation, by the Marquess of Clanricarde, of the petition from Ireland, praying for inquiry. It seemed to be the general feeling, that as the verdict of the Irish Court of Queen's Bench is still open to question by writ of error, nothing should be said respecting the subject; and the Marquess therefore said that he will simply present the petition, without offering any observations on it, and will call the attention of the House to it after Easter. On bringing up the report of the Ecclesiastical Courts Bill, the Marquess of NORMANBY took the opportunity of expressing his dissent to its principle; and after some conservation the report was received.

Friday.—The LORD CHANCELLOR moved the re-appointment of the Committee of last session in the Presbyterian Marriages (Ireland) Bill. He deemed this step to be necessary, in consequence of their Lordships having decided that morning against the legality of such marriages, in the appeal the Queen v. Millis. After a short conversation between Lord Campbell, Lord Cottenham, Lord Chancellor, and Lord Brougham, the motion was agreed to.—A desultory conversation then ensued respecting the appointment of Mr. O'Brien to the stipendiary magistracy in Ireland.

HOUSE OF COMMONS.

Friday.—After the preliminary business noticed in our last, the House resolved itself into Committee on the Factories Bill. The clauses up to 8 were agreed to, with verbal amendments. On the 8th clause, Lord ASHLEY proposed that the *maximum*, instead of being 12 hours, as proposed in the Bill, should be reduced to 10 hours. He contended that females were not sufficiently free agents to be left without such a protection. He argued, from the reports of the inspectors, that it would be vastly better for the moral and social improvement of the people to have more rest with less wages, than to maintain the present system of excessive labour. He believed, however, that the fall of wages would be no necessary consequence from a reduction of the working hours. But even admitting that consequence, he dwelt upon the economical advantages to a poor family, from the cooking, washing, and other domestic work, which might be done by the woman on the 10 hours plan; and argued that these savings would more than compensate any addition which the 12 hours of factory labour might produce. He stated that in the agricultural counties, where the hours of labour were only 10, the amount of crime was smaller than in the manufacturing counties, where the period was 12 hours. He entreated the Government not to overrule the late majority by mere official influence, and called on the House to avoid the discredit of turning round upon its own decision.—Sir W. CLAY opposed the amendment.—Mr. M. MILNES supported it. Wishing in his heart well to the present Government, he could not but regret that they had put themselves in opposition to the good feeling of the country. He trusted that Government would not drive Lord Ashley to an appeal to the throne, in an address from that House, in the belief that their only resource lay in the benevolence and sense of mercy of Her Majesty towards the suffering factory districts. — Mr. V. SMITH also supported the amendment. He did not doubt the courage of Sir J. Graham in going to divisions, but he very much doubted the policy and the prudence of attempting to drive the House of Commons into an act of great inconsistency; he trusted that they had not succeeded in doing so, and that the House would not be induced to be guilty of such gross inconsistency as to reject a motion which they had twice adopted, after mature consideration and fair discussion.—Mr. CARDWELL supported the Government. He did not believe it possible to consider the question as a purely humane one, and apart from commercial considerations.—Mr. BROTHERTON advocated the ten hours limitation on grounds of religion and humanity, recommending the removal of all restrictions on the manufacturing interest, to counteract any evil that might result from the measure.—Lord JOHN MANNERS, though unhesitatingly supporting Lord Ashley's proposition, admitted, at the same time, that there were great contrarieties in the manufacturing districts. The sight of the happiness of Turton and the misery of Bolton made him feel that in the same county there might be a garden and a grave. Were they to proclaim to all Europe that our manufacturing system rested on the over working of women and children? He had a higher opinion of our great manufacturers than to suppose that they would visit the shortened hours of labour by a reduction of wages. The members for Stockport and Manchester had put forward a plea in bar—first, that the commerce and manufactures of this great empire would be destroyed unless these mothers and children were allowed to work twelve hours a day; and, in the next place, that the wages of the work-people would be reduced. But, with something like indignation, and with something like contempt, he begged to ask, was this possible? He never could believe that the commerce of this great kingdom was dependent on longer toil by two hours than it was fitting for a man to endure!—Mr. WARD strongly censured the course taken by his own friends, the Whigs, in supporting the theories of the restrictive party. It had been said that the reduction in wages would not be great; but the first reduction was nothing; for this Bill was to be only the first step in a great career of innovation. Under such legislation no capital would be invested in new mills to supply the decrease in the quantity of your produce from the old ones; and then foreigners would step in and deprive you of your markets.—Sir R. INGLIS warmly supported the ten hours proposition. He called the attention of Ministers to the odd position in which their obstinacy had placed them, of being opposed to nearly all their usual supporters, and supported by nearly all their opponents. He charged them with unusual pertinacity in dividing the committee twice on the former evening upon the insertion of the same word in the same clause, and with unprecedented silence upon the present occasion. He told them it was neither safe nor consistent, nor even decent in them, to attempt to rescind the resolution which had been twice affirmed, and assured them that whether Sir R. Peel, or Lord J. Russell, or Lord Ashley were to be the leader of that House, this question should be decided. Finally, he conjured the Government not to drag their supporters through the dirt, as they seemed inclined to do, for so sure as they did the dirt would stick to themselves, and they would hereafter repent it bitterly.—Mr. C. BULLER ridiculed Government for calling upon the House to make sheer nonsense of their Bill, and for forcing the House to rescind on Friday the vote they had agreed to on Monday, and that without giving them a reason for it. The head of the Government had, to be sure, endeavoured to scare them, by pointing out the difficulties of restricting those employed in other occupations; but he was like the slothful man who cried out "There is a lion in the street," whereas, in reality, there was not even a cat, or the shadow of a cat, to fight them. The hon. Member then exposed the opposite arguments used by Sir R. Peel and Sir J. Graham on this question, the former maintaining that the rise of price in the manufactured articles would be such as to exclude us from the foreign markets, and the latter holding that no rise in price would take place at all, but that a diminution would be made in the wages of the labourer to the extent of 25 per cent. Mr. Buller concluded by calling on the House to recollect that the public would know what gentlemen on that night had changed the vote they had previously given, what gentlemen had received the Ministerial whip, and what gentlemen had chanced to be then present who were absent on Monday night.—Lord F. EGERTON spoke shortly in favour of the amendment, and Mr. COLLETT then moved an adjournment. This was opposed by loud calls for a division; and Mr. T. DUNCOMBE expressed a hope that the debate was not to be concluded without an expression of opinion from some member of the Government as to why they were now to rescind the vote of the previous Monday. The working classes were prepared for any injustice at the hands of the House; but they were not to be prevented from seeing that the question was one between avarice and humanity.—Sir J. GRAHAM said that notwithstanding Mr. Milnes's threat of an address to the Crown, notwithstanding the haughty contempt of Lord J. Manners, notwithstanding the not very friendly speech of Sir R. Inglis, and notwithstanding the sneers of Mr. C. Buller, he had never come to a less hesitating conclusion than he then did, in calling on the House to reverse the vote they had agreed to on Monday. He admitted that he had been taken by surprise on that evening, for he had not expected to have found himself opposed to Lord J. Russell and his party. He stated he had had a deputation that morning of the manufacturers of Lancashire, representing 150 firms, and of these 120 were for maintaining the twelve hours, 17 would consent to eleven hours, and the remainder only were favourable to ten hours. This was the only

result he had to communicate since the last night's debate. He had no fresh arguments to adduce in favour of the proposition he had submitted. The inevitable consequence of a 10 hours restriction would be a great reduction in wages; and so satisfied was he of that, and that disappointment of the most poignant kind would ensue—disappointment leading to the most fatal results—that there was no effort which he, for one, was not prepared to make rather than incur the danger of such disappointment.—Mr. BECKETT stated that the deputation of which Sir J. Graham spoke, had waited on him, and that they were in favour of an eleven hours restriction.—Mr. ALDAM confirmed Mr. Beckett's statement, that the general opinion of the head manufacturers was in favour of eleven hours.—The committee divided on the original motion of the Government to fill up the blank in the clause with the words "twelve hours."—For the motion, 183; against it, 186. Majority against Ministers, 3.—The committee then divided on Lord ASHLEY's motion to fill up the blank with the words "ten hours."—For the motion, 161; against it, 188. Majority against Lord Ashley, 7.—Sir J. GRAHAM then stated that he would take till Monday to consider the course the Government would adopt under the circumstances.—Lord ASHLEY said, although defeated on that occasion, he would on all legitimate occasions assert the principles he had advocated. On that principle he would persevere to the last hour of his existence; and at no very distant period he confidently hoped, by the aid of God's blessing, to see it triumph.

Monday.—There was a crowded attendance of members to hear the decision of the Government on the subject of the Factories Bill.—Sir J. GRAHAM prefaced his speech by an expression of the profound respect which Government entertained for the opinion of the House of Commons, when constitutionally declared. But there was another duty paramount to even that of yielding to the feelings of a majority—that of an Administration refusing to adopt a policy which they really believed to be injurious to the welfare of the State. The Government had maturely, deliberately, and carefully considered the course to be adopted; and it appeared to them that there were three alternatives consequent on their threefold defeat, twice on Monday last, and once on Friday. The first course was a compromise, and as the House had, on Friday night, rejected both a "ten" and a "twelve" hours limitation, the compromise would appear to be the adoption of an "eleven" hours Bill. The second course which might be taken, was simply to drop the Bill, and leave the law as it now stood. The third course was the dropping of the present Bill, and the introduction of a new one, embodying such provisions as were likely to receive the sanction of the House. With respect to the subject of a compromise, he entered into considerable details. Compromises were frequently justifiable and expedient; but to render them so, it was necessary that they should be advantageous in their nature, and effect a settlement of the question in dispute. Now, Government did not think that the adoption of "eleven" hours would be a safe or expedient compromise. In the first place, it would be most injurious to the master manufacturer—to the capitalist. A diminution from twelve to eleven hours might appear, at first sight, to be of very little consequence. But that limitation was a restriction of the action of machinery, which both in woollen and in cotton, but especially in the latter, would be productive of most serious consequences. In the cotton districts, as he had been informed, it was frequently necessary, in busy times, to work longer in order to retrieve the losses of other periods. Now, the restriction to eleven hours would not only affect rates of profit, but even the permanence of the employment of capital, and the prosperity of the master manufacturers was bound up with that of the state. But this diminution of one hour daily would also seriously affect the workman. He affirmed, once more, that it would cause a reduction of wages from fifteen to twenty-two per cent.—a reduction which would lead to more dangerous combinations amongst the workmen themselves. But, great as the change would be, it could not be more so than the surprising nature of some of the arguments by which it was supported. He had heard it alleged, on Friday night, that there were moral wages as well as money wages; that lower were better than higher wages for the sake of the workmen themselves. But he was sure that a forced legislative reduction in the only commodity which the workmen possessed would be attended with a deterioration in their moral condition. They had, moreover, been told that a new social condition required new principles of legislation, and on this ground they were urged to a limitation of the hours of labour. It would be far better, at once, not to determine the maximum of labour, but the minimum of wages. But the adoption of such a course would be the commencement of a JACK CADE system of legislation. For while the adoption of the 11 hours would be dangerous to the State and detrimental to the workman, it would not settle the ten hours agitation. The delegates of the operatives, assembled in Manchester so lately as Sunday last, had resolved that they would never abandon their exertions until they had succeeded in carrying a ten hours Bill. Passing to the second course which was open to Government to adopt, that of dropping the Bill, and leaving the law as it now stood, he saw many objections to it. The principle of restricting the labour of young children to six hours and a half daily had already been sanctioned; and there were other provisions which were likely to be approved of, the advantages of which he would not like to lose. There was then the third course, that of abandoning the present Bill, and of bringing in another containing such provisions as were likely to receive the sanction of the House. But Government were still, with all respect to the opinion of Parliament, determined to resist all limitation of the hours of labour to less than twelve hours. He concluded by proposing that the Committee should be postponed till Friday, when he will move to rescind the order, and ask for leave to bring in a new Bill.—Lord ASHLEY said he was taken by surprise by the course which the Government had adopted, and would postpone all debate till Friday. He reminded the House that it had solemnly, by three successive divisions, rejected the twelve hours; and, alluding to the term Jack Cade, said he did not repudiate the title, for the insurrection of Jack Cade arose from the people writhing under a burden too heavy to be borne. With the people at his back, and Jack Cade as their leader, he would still persevere in his agitation; and he hoped that those who had hitherto voted with him would stand by him on Friday next.—Lord HOWICK recommended Lord Ashley to resist on Friday next the discharge of the order, because if he allowed the Bill to be withdrawn, the Government would introduce a new Bill still more objectionable, and Lord Ashley would then have to reproduce his clause; and if that were carried again, the Government would drop the Bill altogether.—Mr. BROTHERTON regretted that the Government had not acceded to an eleven hours' restriction, which he believed would have met general concurrence.—Captain ROUS had heard that evening a great deal about Jack Cade, but there were proofs in the Bill about the inspection of surgeons, &c., which made it not unlikely that some Wat Tyler might arise, for Wat Tyler, they might remember, destroyed a man for taking liberties with his daughter. He did not understand on what principle the House of Commons was to regulate the hours of employment between employers and employed.—Sir R. INGLIS taunted the Government with the course which, in the entire possession of their faculties as well as of their tempers, they had resolved upon adopting. He demanded of Sir R. Peel, whether a minute of the Cabinet had been made that it was the opinion of that Cabinet that 93 Members who generally supported them, and who on this occasion had voted with the noble Lord, were leagued together to uphold a Jack Cade system?—Sir J. GRAHAM considered he was the proper person to answer that question. The resolution he had stated was the resolution of the entire Government; but the particular expression was altogether his own. He had taken that expression from the *Examiner* newspaper, and had no idea of applying it to Lord Ashley, or any hon. Member who voted with him, but only to the system.—Mr. BERNAL recommended Lord Ashley not to take the advice given to him by Lord Howick, but to wait his opportunity, and move the insertion of his clauses in any Bill that might be introduced by Government, and if the preamble of that Bill would not permit it, then to move an instruction to the committee.—Lord SANDON, in an endeavour to extract what really were the intentions of the Government, asked whether the intended new Bill would contain any regulations of the hours of labour of women?—Sir J. GRAHAM said, it was his intention, in the Bill which he should introduce, to insert a limitation of adult female labour to the period of twelve hours.—Lord J. RUSSELL thought that the phrase "Jack Cade" was infelicitous, as applied to the conduct of such Conservative members as Sir R. H. Inglis. Giving the Government credit for *their* sincerity, they might allow that others were equally sincere in supposing that the industry of the country could be maintained by giving protection to the labourer, without supposing the adoption of any new or dangerous principle in legislation.—Mr. HUME was glad that the matter was to be postponed till Friday next, as it would give the country time to breathe, and to recover from its surprise. He warned the House against rashly adopting principles which would lead them to interfere with the freedom of labour, to an extent scarcely to be calculated on; and urged freedom of commerce, rather than interference with labour.—After some observations from Mr. BORTHWICK, Mr. C. BULLER adverted to some comments of Sir J. Graham on his speech of Friday night, respecting new principles of legislation being required for a new social state of things, and blamed the Home Secretary, in an amusing way, for not having then answered him, instead of waiting till that evening.—Sir R. PEEL did understand Mr. C. Buller to have avowed that he supported the ten hours, because it was the commencement of the application of a novel system of legislation to a new state of things, and which he was prepared to push as far as practicable. The Government had always looked upon this question as a most important one to the interests of the country; and considered that they were performing the first duties of a Government in resisting a proposition which they thought would prove so detrimental to the working population themselves. He hoped that on Friday next the House would come to its deliberate consideration, not in a party spirit, but with a due sense of its importance.—After some observations from Mr. MORRISON in support of Ministers, Lord STANLEY remarked that though there was no difference between the Government and Lord Ashley on *principle*, as to interference with factory labour, there was a very important one of *detail*, which they considered to be of great consequence to the commerce and industry of the country. It would, therefore, neither be a wise nor a worthy course in them to hold any doubtful language on the subject, or to lure on the working classes with any vague expectations of their ever granting that which they believed would be injurious to the interests of those for whom Lord Ashley benevolently but mistakenly laboured.—Mr. HAWES reminded the House that the Government had it in its power to compensate the working classes for any fall in wages, through the adoption, in conjunction with restriction of labour, of a liberal commercial system.—Mr. AGLIONBY, Mr. EWART, Dr. BOWRING, Mr. MITCHELL, Mr. ESCOTT, and Mr. BROCKLEHURST wound up the debate, and then the question of the Factories Bill was postponed till Friday.—The Mutiny and Marine Mutiny Bills, and the night Poaching Prevention Bill passed through committee.—The Indemnity Bill and the International Copyright Bill were read a third time and passed.—On the motion of Sir R. PEEL a select committee was appointed to inquire as to what means can be adopted for the improvement of the law respecting the trial of controverted elections.

Tuesday.—The second reading of the Chichester and Brighton Railway Bill was carried, on a division, by 99 against 48.—Several other Railway Bills were advanced.—Colonel WOOD (Brecon) moved for leave to bring in a Bill to exempt from toll all lime conveyed on any turnpike road in Wales. He explained the general purport of the Acts of Parliament that regulate this subject in Wales, and the great hardship with which this toll, an impost on manure, is found to bear upon the small agriculturists in Wales; indeed he believed it to have been really the primary cause of all the late disturbances. While lime bore the heavy toll he thus complained of, the artificial manures in general, such as guano and bone-dust, paid no duty at all.—Mr. HUME said this was an attempt to relieve the landowners by relieving the farmers, and he objected to any measure that went to relieve these classes from burdens borne by other people.—Mr. MANNERS SUTTON would not object to the introduction of the Bill, but was not prepared to support it in its future stages.—Alderman THOMPSON said that the whole subject of turnpikes in Wales required consideration and reform.—Sir J. WALSH said that great excitement and expectation prevailed on this subject in the Principality.—Mr. LABOUCHERE apprehended, that to allow the introduction of the Bill with the intention of ultimately rejecting it was, on the part of Government, a course which would occasion great disappointment in Wales. If Government had made up their minds to reject it, they would do better not to allow its introduction.—Sir J. GRAHAM thought it might be deemed discourteous to refuse the introduction of the Bill.—Mr. BARING presumed that the Government had the whole report under their own consideration, and if so it was a strange proceeding in them to allow an individual member to introduce a piece of legislation affecting only one very small point of the Commissioners' recommendation.—Mr. MORRIS, Sir W. JOLLIFFE, Mr. DARBY, Mr. TREVOR, Lord EBRINGTON, and other members, took part in the discussion, each advert ng to some particular or local point, and a division was called for, when leave was given to bring in the Bill by 68 to 42.—Mr. HUTT moved that the House should resolve itself into a committee on the Corn-laws, for the purpose of considering the resolution:—"That it is expedient that corn imported into the United Kingdom from the British possessions of South Africa, India, and Australasia, be made subject to the same duty which is levied on corn imported into the United Kingdom from Canada." He urged the claims of our other colonies, superior even to those of Canada, to a privilege similar to that which had been conferred on it; pointed out the capabilities of Australia for growing wheat, which could be imported at a rate and in such condition as would enable it to compete with any other grain in the market, while its quality was exceedingly fine—facts already tested by experiment: on this department of his subject entering into considerable detail. He then adverted to the Cape of Good Hope, the grain growing characteristics of which were not dissimilar to those of Australia—to India, where there prevailed a strong desire that a similar privilege should be accorded to it, as had been granted to Canada; and concluded by a general plea in favour of all our colonies, to whose trade with this country the addition of a corn trade would be a great boon, however small at first it might be.—Mr. MANGLES seconded the motion, and, in doing so, dwelt on the especial claims of India to consideration.—Mr. GLADSTONE could not imagine that the difference between five shillings and one shilling was so great as injuriously to interfere with those experiments in the importation of corn from our other colonies now going on. During the progress of the Canada Corn Bill, the Government had distinctly declared that it would not consent to disturb the whole Corn-law system of the empire for advantages so small as would accrue from extending similar advantages to our other colonies. Besides, there was no exact analogy; for the three shillings duty imposed by the Canadian Legislature on corn imported from the United States, was an essential portion of the conditions by which we admitted Canadian corn at 1*s.* Our Australian colonies were importing rather than exporting countries in the article of grain, as appeared by taking a period of fourteen years—Van Diemen's Land excepted—which, however, sent its surplus to New South Wales, the Mauritius, and other nearer markets than this country. So, also, the Cape of Good Hope received more grain from England than it had hitherto ever sent to it, or was likely to send. He agreed that every encouragement should be afforded to India; but the length of the voyage, and the various climates, presented a serious obstacle, for even flour could with difficulty bear the transit, frequently turning sour before it reached this country; and it was only under the influence of such high prices as would afford the actual advantage of the one shilling duty, that grain could be brought from thence. He contended that Mr. Hutt had altogether failed in making out a case for interference, or that the advantages which would arise from the adoption of his motion would counterbalance the evils which would arise from the panic which the change would excite.—Mr. LABOUCHERE supported the motion. He could not see why a difference should be made between Canada and our other colonies.—Lord STANLEY said if there were any great or real necessity for what Mr. Hutt proposed, owing to the price in this country rising to a great height or to there being a deficiency of supply which the colonies could make up, then he was ready to admit that he would have made out his case. But, as such was not the case, and the colonies were last year warned not to expect to be placed on the footing on which Canada had been placed, and as it had been shown that the colonies named in the motion could not import corn at a lower price than that at which corn was now admitted into this country, he must resist the motion; and he must say, he never heard a case that was less made out, or which appeared to him to be of less importance, or for which the House could be less disposed to alter a law of infinite importance, and of infinite delicacy, and one which involved some of the most important interests of this country. The House divided—For the motion, 47—Against it, 117—Majority against the motion, 70.—Sir G. STAUNTON moved that the House should, on an early day, resolve itself into committee to consider the propriety of presenting an address to her Majesty, praying that a suitable provision be made for the widow of the late Dr. Morrison and the other surviving members of his family, in consideration of the eminent public services rendered by him, and his eldest son, in China.—Sir R. PEEL objected to the motion, on the ground that the case of Dr. Morrison's widow and children was not such a peculiarly hard one as to warrant the House in adopting the unusual course proposed. The widow was in the actual receipt of a pension of 200*l.* a year for herself, and 25*l.* each for her five children. Her eldest son was appointed by Lord Aberdeen to a situation in China, with a salary of 300*l.* a year, and with the prospect, under good conduct, of an ultimate salary of 600*l.* a year; and her second son had been promised by Lord Aberdeen suitable employment under Government as soon as he should attain an age that fitted him for filling a public office. Under these circumstances, and knowing that there were hundreds of other claimants, whose cases were much stronger, that it was impossible to satisfy, he hoped the hon. Baronet would not press his motion. Upon this Sir G. STAUNTON withdrew his motion.

Wednesday.—Mr. MUNTZ moved the second reading of the Birmingham Corporation Bill.—Mr. DUGDALE moved as an amendment that it be read a second time that day six months. The House divided—For the second reading, 67; against it, 77; majority against the Bill, 10.—Lord ASHLEY announced that he would not oppose the withdrawal of the Factories Bill. The noble Lord said, "It is not my intention to offer any opposition to the proposal of the Government. I know that in so doing I surrender many advantages which I now possess. But I think it is my duty, when I can, without compromising any principle, to consult the convenience of the House and the Government. Therefore I take this course on the full understanding that the Government will immediately introduce another Bill, and will take the discussion upon it on the earliest possible day after Easter. I presume that the House will not ask me now to state what course I may feel it my duty to pursue on that occasion; but I beg leave to state that on Friday I shall offer no opposition to the withdrawal of the Bill, and I beg to add, that I have come to that determination with the full concurrence of my noble friend the Member for Sunderland."—Sir J. GRAHAM then gave notice that it is his intention to move on Friday, that the order of the day for the House resolving itself into committee on the Factories Bill be discharged; and that after that order of the day shall have been disposed of, he will move for leave to bring in a Bill to alter the existing laws for regulating labour in factories. If the present Bill should be withdrawn, and leave to introduce a new Bill should be obtained, he will move that it be read a first time on Friday and printed, and will fix the second reading for an early day after Easter.—Sir R. PEEL took occasion to correct a misreport of an expression which fell from him on Monday night, and which he felt satisfied arose from the low tone in which he spoke. He had been reported to have said that the factory question was "no party one," whereas the expression he had really used was, that it was no "departmental" question.—Lord WORSLEY, in consequence of indisposition, postponed the committal of the Commons Inclosure Bill to the 26th of April.—The County Coroners Bill and the Masters and Servants Bill were postponed till after Easter.

Thursday.—There was only 34 Members present at 4 o'clock, and consequently there was "no House."

Friday.—After a great deal of preliminary business chiefly connected with Railways, Sir J. GRAHAM said, before he moved the order of the day relating to the Factories Bill, he wished to call the attention of the House to a petition, numerously signed, by manufacturers of Manchester, who employed 30,000 men women, and children, stating that, in their opinion, if the hours of labour were contracted, the price of wages must be lowered.—Lord HOWICK, and several other members, presented petitions, praying that no restrictions might be placed on the hours of labour.—Lord ASHLEY, Lord J. RUSSELL, and other members, presented petitions in favour of the Ten Hours Bill, and praying the House not to allow it to be withdrawn (left sitting.)

CITY.

Money Market, Friday.—Consols continue at 98¼ to ⅛: New Three-and-a-Half per Cents. 102⅝ to ⅝; and Exchequer Bills, 68*s.* to 70*s.* prem.

GAZETTE OF THE WEEK.—BANKRUPTS.—R. WEBSTER, of Oxford-market, Middlesex, victualler—W. G. KELSON, of Canterbury, builder—T. ANLABY, of Little Earl-street, Seven Dials, victualler—W. LOTT, of Ipswich, Suffolk, grocer—E. and A. S. LEVY, of Oxford-street, and of Botolph lane, City, fruit-merchants—I. ECKERSLEY, of Liverpool, victualler—J. WILLIAMS, of Newtown, Montgomeryshire, flannel-manufacturer—J. RIDGWAY, of Chester, fringe-manufacturer—J. WILDEY, jun., of Nottingham, upholsterer—R. HITCHCOCK, of Taunton, Somersetshire, miller—S. BETTISON, of Leamington Priors, Warwickshire, wine merchant—B. POUNTAIN, of Derby, wine-merchant—G. and R. CAVE, drapers, Banbury, Oxfordshire—J. BALLS, livery-stable-keeper, Holloway-road, Islington—T. SMITH and J. OSBORNE, builders, Redcross-street, Southwark—J. PEATEN, ironmonger, Paddington-street, Marylebone—C. DEANE, coach-builder, Southampton—W. BECKETT, money-scrivener, Doncaster—H. H. WRIGHT, cattle-dealer, Hatton Grange, Shropshire.

Metropolis and its Vicinity.

Central Protection Society.—At a meeting of the general committee, held at the residence of the Duke of Richmond, the following arrangements were made:—Rooms were taken at 19, Old Bond-street, and a secretary appointed, to whom all communications are to be addressed, at the Society's rooms. The office hours were fixed to be from ten to four daily, during which time the secretary will attend. Reports were received, and unanimously adopted, from the Finance, Correspondence, and Publication Committees. Numerous letters were read from the country, expressing a desire to co-operate with the society, and several large sums were added to the funds. In

addition to the favourable opinion already given by Mr. Platt, a case has been submitted to Mr. F. Kelly and Mr. Talbot, and their joint opinion has been given, that the Society is perfectly legal in itself, and its rules in conformity with the Act of Parliament.

Sale of the Duke of Devonshire's Coins and Medals.—The sale of the first portion of this collection was concluded on Saturday, at Messrs. Christie's rooms. The sale was well attended through the week by connoisseurs and dealers, but the bidding was confined to a few individuals, Mr. Cureton, who was commissioned by the trustees of the British Museum, purchasing fully one-half of the collection for that institution. Colonel Fox also purchased largely; but, beyond these gentlemen, few persons bought to any extent. The sale on Tuesday commenced with the Greek silver coins, which were continued throughout Wednesday and Thursday, the lots selling remarkably well. The Roman series was submitted on Friday. The amount realised by the first day's sale was 478*l.* 19*s.*; second ditto, 730*l.* 19*s.* 6*d.*; third, 498*l.* 15*s.*; fourth, 430*l.* 17*s.* 6*d.*; fifth, 585*l.* 1*s.* 6*d.*; sixth, 612*l.* 14*s.* 6*d.*—making a total of 3357*l.* 5*s.* 6*d.* The sale of the second portion, including the Saxon and English series, commenced on Monday last.

Bank of England.—The half-yearly general meeting was held on Friday, and was one of the shortest that has been known for many years past, lasting scarcely more than 20 minutes. The dividend declared was 3*l.* 10*s.* per cent. for the half-year (from which the income-tax is to be deducted), and to make up the 509,355*l.* which is required to pay it, 10,603*l.* is deducted from the "rest," leaving 3,159,966*l.* It was resolved that Mr. Cotton, the present Governor, should be continued in office another year, on account of the negotiations with Government respecting the charter. As they began under the present Governor, it was thought expedient that they should be concluded during his tenure of office, while at the same time a compliment would be paid to his zeal and efficiency.

Medical Protection Society.—An aggregate meeting of the medical profession took place on Monday evening at the Crown and Anchor Tavern. For some time before the time of meeting the room was filled by members of the profession. The chair was taken by H. Ancell, Esq., who was supported by many gentlemen of eminence as medical practitioners. The Secretary read the report of the committee, embodying its views of the charter of the College of Surgeons, and of the conduct of the council under it, and denouncing the principle of exclusion, which operated unfavourably on the rights and privileges of the great majority of the profession. A series of resolutions to the same effect were then moved and seconded by various gentlemen present, all of which were carried without a dissentient voice. A petition to the same effect was read to the meeting, which, before presentation to Government, was to receive the signatures of the members of the society. The Treasurer then read the amount of subscriptions, which, including one by Mr. Wakley, M.P., of 25*l.*, amounted to 99*l.* 9*s.*

Metropolitan Improvements.—The site of the contemplated Thames embankment on the Middlesex side of the river is undergoing a minute survey. At Pimlico the houses are nearly all pulled down for the new road, which will join the Vauxhall-road, and widen the vicinity of Buckingham Palace. The "rookery" which has existed for so many centuries in Westminster, is also to come down to make way for the improvements. The widening of Piccadilly, by taking in a small portion of the Green-park, will commence next month. The new street leading from Coventry-street across Leicester-square to Long-acre is in an advanced state, as all the old buildings are pulled down, and workmen are laying the foundations of the new houses. The new street from Waterloo-bridge, across High-street, Bloomsbury, is proceeding rapidly, and several hundred houses have been pulled down in the neighbourhood of St. Giles's. The new Farringdon-street to Islington is also advancing. Among the other improvements, it is said that beadles have been appointed to perambulate the Quadrant, having the warrant of special constables from the commissioners of police, to remove the improper persons who have made the Quadrant their rendezvous, with the dog-fanciers and well-known thieves. Active measures are also in progress to remove all houses of bad character in its vicinity, and to suppress the numerous billiard rooms which have so long infested the Quadrant.—Much curiosity has been excited at the West-end during the week, by the commencement of the laying down of the India-rubber pavement in the Court-yard of the Admiralty, Whitehall.

Anti-Corn Law League.—The weekly meeting of the League was held on Wednesday in Covent Garden Theatre, which was, as usual, crowded in every part. Mr. T. M. Gibson, M.P., presided, and the meeting was addressed by Mr. Gisborne, Mr. Bright, and Mr. W. J. Fox. The chairman announced that the meetings would be renewed after Easter.

Astley Cooper Prize.—The first award of this prize, under the will of the eminent surgeon whose name it bears, has just taken place. Sir A. Cooper bequeathed a large sum of money to be appropriated in triennial prizes for the best essay on certain physiological subjects named by himself; the first, the one now adjudicated, being "On the Structure and Uses of the Thymus Gland." The physicians and surgeons of Guy's Hospital are the appointed judges, and the successful competitor on this occasion is Mr. Simon, one of the anatomical teachers in King's College, and assistant surgeon to King's College Hospital.

Westminster Bridge.—A design by Mr. Barry for an iron bridge on the site of the present bridge has been published; it consists of five elliptical arches, and is at least 14 feet lower than that now in use. The plan for this new structure is proposed in consequence of the unsafe and unsatisfactory state of the foundation of the existing bridge, as well as to improve the navigation of the river, and facilitate traffic by lowering the carriage-way. It is said that an iron bridge of this description could be constructed for less than double the amount that would be required to repair and render secure the present structure. The cost has been estimated at 185,000*l.*, including the expenses for erecting a temporary wooden bridge, and it is understood that this sum might be raised for the most part, if not wholly, upon the security of the income from the property belonging to the Bridge Commission.

Trafalgar Square.—The works within the inclosure of Trafalgar-square are proceeding rapidly towards completion, Mr. Barry, the architect, having devoted much of his time of late for the purpose of causing the whole to be thrown open to the public during the summer months. The Artesian well is likewise fast advancing, the bore having been already sunk a considerable depth. The basins of the fountains will be 83 feet in diameter, and are to be covered with Patent Portland Cement, which has been found to resist the action of the atmosphere and of water as long as most descriptions of stone, while it possesses and retains the colour of that material. The pavement of the inner court of the quadrangle is to be laid out in a somewhat tesselated style, the darker parts being composed of asphalte, and relieved by the introduction of ornamental work in the Portland cement. The whole space to be covered is about 18,000 feet. The proposed dinner to the Greenwich pensioners, which was to have taken place early in April, is postponed for the present, in consequence of the incomplete state of the square.

The New Poor Law.—On Tuesday, a numerous deputation from the delegates of the Metropolitan parishes, attended by several members of Parliament, had an interview with Sir J. Graham at the Home-office, in reference to their objections to the new Bill. After various points had been discussed, Mr. T. Duncombe asked if Sir J. Graham would undertake to pledge himself to insert a general clause exempting all parishes having local acts from the operations of the Bill? Sir J. Graham said he was not prepared at once to give such a pledge. He should, however, certainly deliberate upon the representations made by so numerous and respectable a deputation, and he should feel it his duty to represent to the Government the arguments which had been adduced.—Mr. Duncombe said, under such circumstances, he would suggest to the deputation that they should leave the matter for the present entirely in the hands of Sir J. Graham. Sir J. Graham said that the deputation might depend upon it that their representation should receive his best attention. The delegates afterwards appointed a joint committee of all the parishes to watch the Bill, and to ascertain from Sir J. Graham his decision on the point submitted to him.

Fancy Fair under the Thames.—Monday, being the anniversary of the opening of the Thames Tunnel, a fancy fair, which was repeated for three days, was held in the Tunnel. The centre arches, that divide the two parallel lines of road through the Tunnel, were adorned with evergreens, and nearly all occupied by stalls, displaying fancy goods of various kinds. The number of visitors who passed through the Tunnel at each end are computed to have averaged 2400 per hour. The crowd became so dense at the entrance on the London side of the Tunnel, in Wapping, that great numbers of persons lost their patience and crossed the river in boats to get into the Tunnel at the Rotherhithe entrance. On Monday 10,178 persons visited the Tunnel; on Tuesday 35,440; and on Wednesday 20,740; making altogether 66,367 persons, producing 276*l.* 10*s.* 7*d.* for the three days.

Woolwich.—The Boscawen, 74, is now in such a forward state at this dockyard as to insure that she will be launched on the day named, Wednesday next, April 3. The launch will take place betwixt 1 and 2 o'clock, P.M. As it will be some time before another large vessel will be ready for launching so near the Metropolis, great numbers of persons will doubtless be present to witness the ceremony.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending March 16—West Districts, 158; Northern, 185; Central, 189; Eastern, 212; Southern, 245; Total, 989. Weekly average for the last five years, 946.—The Poor-law Commissioners have issued a circular to the authorities of the various parishes, calling upon them to require the inhabitants to comply with the Vaccination Act, for the prevention of small-pox. Medical practitioners are appointed by that Act in districts throughout each parish, for the purpose of performing vaccination gratis. This intimation has been made by the Commissioners in consequence of the alarming increase of mortality throughout the metropolis, particularly the more populous parts, arising from the prevalence of small-pox.

Provincial News.

Agricultural Meetings.—The following meetings in favour of protection have been reported since our last notice. At Dunmow on Tuesday, Mr. Baker of Writtle in the chair, supported by the Rev. H. L. Majendie, Messrs. C. Clarke, W. Shepherd, M. D. Duffield, R. D. Duffield, J. Marryon Wilson, W. T. Wade, H. Cheffins, W. Johnson, S. Wood, and about 300 tenant-farmers.—At Roxburgh on the 19th, Sir John Pringle, Bart., of Stitchell, Vice-Lieutenant, in the chair, supported by many hundred landowners and agriculturists of the county.—On Wednesday week at Mold, J. W. Eyton, Esq., in the chair, supported by about 300 landowners and tenant-farmers of Denbighshire and Flintshire.—On Tuesday at Lincoln, the Hon. A. L. Melville in the chair, supported by numerous landowners and delegates from the other district Societies, at which it was resolved to form a County Central Society for Protection, to correspond with the London, and other local Societies.—On Wednesday at Yealmpton, Mr. T. Vosper, a tenant-farmer in the chair, supported by the Earl of Morley, Rev. Mr. Yonge of Puslinch, W. Radcliffe, Esq., of Warleigh, Col. Mudge of Beechwood, Col. Harris of Radford, G. Strode, Esq., of Newnham, and a large number of the neighbouring landowners and tenant-farmers.

Appleby.—It will be recollected that at the last summer assizes, at the instance of Lord Brougham, actions-at-law were tried, John Bird of Ashton, cotton-spinner, his sons, and nephew being the defendants in one action, and an auctioneer in Cumberland the defendant in the other, for the defendants laying claim to and taking unlawful possession of Brougham Hall and lands, and for making a distress for rent on one of his Lordship's tenants. Verdicts were returned for Lord Brougham. Some time after the trials the costs were taxed, and demands of payment made on the defendants, but not being able to pay, executions were issued, and the property of those of the defendants who had any was seized and sold. It appears that the goods and chattels of the defendants were insufficient in value to liquidate the amount of costs and expenses; and in consequence writs of *ca. sa.* have been issued, warrants granted, and the Birds a few days ago were arrested and sent to prison. It is understood that the auctioneer also has been sent to Carlisle gaol.

Dover.—The local papers state that the Earl of Guilford, the proprietor of the Frith Farm, near the Castle, is about to apply to Parliament for a private act, to enable him to let a portion of the valley on lease for building purposes; and that plans for the erection of terraces, said to be equal in design and magnitude to any in the kingdom, and for detached villas, have been prepared, including altogether nearly 1500 residences. It is also said to be part of the plan to make another outlet from the town into the Deal road, past the Castle Jetty, by which the Castle-hill may be avoided, and the distance to Deal considerably lessened.

Eton.—The result of the examination for the Newcastle scholarship (which was conducted by the Rev. J. Chapman, and Sir Francis Doyle, Bart.,) was announced on Saturday. There were twenty-three candidates. The following were selected by the examiners as having highly distinguished themselves:—Scholar, Drake, K.S.; Medallist, Wolley, K.S.; Hunt, K.S.; Mr. Herbert, M'Niven, Pearce Serocold, ma.; Wright, K.S.—equal by alphabetical; Buller, Thornby, Pattison, and Smith, ma.—equal by alphabetical. At a recent meeting of old Etonians, it was agreed that extensive alterations and additional buildings should be made in the College, for the accommodation of the scholars on the foundation, at the estimated cost of 23,000*l.* It is proposed to erect the new building on the site of the coach-house and stables of the Provost and Fellows, to improve the present long chamber, to form proper sewers, and to provide an apparatus for warming with hot water the apartments in which the scholars will be lodged. It is also intended to form on the ground-floor of the new building, which, from local circumstances, cannot be applied to the accommodation of the scholars, one large room for the reception of the library of the school, which may be used as an examination-room for the Newcastle Scholarship, and for the prizes given by Prince Albert for proficiency in modern languages, and also rooms in which the different masters for modern languages and mathematics may receive their pupils. There will be also two rooms appropriated in the tower for the use of the upper boys in the evening.

Hereford.—During the night of Friday week an unusual occurrence took place on Claston Estate, in the parish of Dormington, the property of Edward Foley, Esq., of Stoke Edith-park. A large piece of land, consisting of more than three acres of rock and earth, with 40 oak trees, slipped down Dadnor's-hill, a distance of 200 yards, into the valley beneath, and now presents a very curious appearance, the projected masses of rock forming fantastic shapes of caverns, &c., and some of the trees remaining upright as if growing. From the ground cracking, &c., there had been previous indication of the coming "slip," and no doubt the wet weather hastened the result. The damage is estimated at 150*l.*

Liverpool.—Another fire broke out in this town on Saturday morning, in Messrs. Pringle and Harvey's rice-mill. The flames raged with such violence that the contents of the mill were almost wholly destroyed and the surrounding premises were for some time in danger. There were two workmen in the mill at the time, and the only manner in which the fire can be accounted for is by the friction of the grinding-stones. The damage to mill and property is considerable, but the parties are insured.

Nottingham.—Another prisoner has effected his escape from the gaol of Nottingham. It appears that early on Wednesday morning a man named Shelton, who was under sentence of transportation for life for stealing sheep, contrived to elude the vigilance of the turnkeys, and climbing the walls, managed to drop into the street, and ran off. He was, however, not more than a few hours away, for the officers set out in active pursuit, and soon overtook the prisoner, and restored him to his old quarters.

Oxford.—On Monday week, the Defiance, Oxford coach, was robbed of 1500 sovs., which had been forwarded from a banking-house west of Temple-bar to Messrs. Robinson, Thomson, and Co., of the Old Bank, Oxford. The coachman, Mr. Hobson, who is a highly respectable man, it appears has been in the habit of bringing bankers' parcels to Oxford, which no doubt some of the swell mob were aware of. The box containing the gold was put in

its accustomed place of security, in the front boot, in London, but on arriving at the Old Bank, Oxford, it was missing. It is supposed that the robbery was committed by a person who occupied the box-seat, as on arriving at Benson he was seen to open the boot, during the time of changing horses, and take something out. One of the passengers, who is also supposed to be a confederate, stopped at Benson, where he was taken into custody the same night; he has undergone a private examination before the magistrates, and has been identified by the London police as a known thief. The box passenger kept his place to Oxford, and at that time not being suspected any more than any of the other nine passengers, got off the coach and has not since been heard of. Had the thieves fully carried out their intended plans, this robbery, for ingenuity, would have ranked foremost in the annals of coach robberies. It appears their intention was to have changed the parcels, as they had provided themselves with a bag exactly the size and colour of the one containing the gold, with a box in it a *fac-simile* of the banker's box, and the weight of each was about the same. From these circumstances no doubt remains of this being what is termed a put-up robbery. The thieves not being able to substitute the dummy for the bag containing the gold, and finding it would be rather inconvenient to bring it to Oxford, as it would probably have led to suspicion, contrived to drop it off the coach unobserved between Nuneham and Oxford, where it was picked up in ten minutes after the coach had passed. The contents of the bag were a brick and a quantity of sand.

Portsmouth.—A court-martial was held in this harbour on Monday, to try Mr. Jas. Hand, second engineer of H.M.'s steam-vessel Prometheus, Lieut. Pasco, for neglect of duty in allowing the water in one of the boilers to become so low that the engines were disabled, and the vessel compelled to return to England after reaching Madeira. The prisoner, at the time, alleged as his excuse that on making the discovery he was frightened, and did not know how to act. The court, after some deliberation, decided that the prisoner be dismissed the Service.—A report has appeared in the *Times*, copied from one of the local papers, stating that a reporter, who had obtruded himself into Prince Albert's barge during his recent visit to the Isle of Wight, had been summarily punished by being towed to Portsmouth in an open boat, and then dropped in the mud. This account has been denied by the reporter himself, who admits that he did obtrude himself into the Prince's barge, but states that he was treated with consideration and forbearance.

Wednesbury.—The coroner's inquest on the body of Ann Griffiths, Mr. Crowther's housekeeper, whose murder was noticed in our last, terminated after two adjournments on Saturday. Suspicion had fallen upon a man named Beard, who formerly worked for Mr. Crowther, and who had been seen going towards the house on the morning of the murder. On his being apprehended it was found that upon the wrists of his shirt were marks of blood, and without any observation being made to him he said "I did not commit the murder." Foot-marks near the house, on being compared with the prisoner's boots, corresponded exactly. The prisoner in his defence said that the boots were most certainly his, but that he was not near the place nor had he the boots on at all the day of the murder. The Jury returned a verdict of "Wilful murder" against the prisoner, after which he was fully committed to Stafford Gaol to take his trial.

Worcester.—A commission under the Church Discipline Act was opened last week to inquire into certain charges preferred by the churchwardens of Cradley in this county against the Rev. John Jones, rector of the parish. Mr. Jones is a married man, having a family grown up; and the points sought to be proved were that he had been in the frequent habit of visiting a person of bad character at a house of ill-repute in Birmingham; and that during the last summer he made excursions to Stratford and Lichfield in company with the woman, with whom he kept up a correspondence through the post-office, under the assumed name of George Hallen. The commissioners did not examine all the witnesses in attendance, but were unanimously of opinion that a *primâ facie* case had been made out. On Saturday Mr. Jones received an inhibition from the Bishop to prevent his performing the duties of the Church, which were performed on Sunday by the Rev. R. B. Hone, vicar of Hales Owen. The commissioners were the Rev. H. A. Woodgate, Bellbroughton; Rev. T. L. Claughton, and Rev. J. Downal, Kidderminster; Rev. T. Baker, Harlebury; and Rev. J. Peel, Waresley-house.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1204*l.*; Birmingham and Gloucester, 2067*l.*; Eastern Counties, 3232*l.*; Edinburgh and Glasgow, 1984*l.*; Great Western, 11,251*l.*; Grand Junction, 6335*l.*; Glasgow, Paisley, and Ayr, 1211*l.*; Great North of England, 1334*l.*; London and Birmingham, 13,283*l.*; London and South-Western, 4681*l.*; London and Blackwall, 618*l.*; London and Greenwich, 645*l.*; London and Brighton, 2455*l.*; Manchester, Leeds, and Hull, associated, 5246*l.*; Midland Counties, 2237*l.*; Manchester and Birmingham, 2672*l.*; North Midland, 3949*l.*; Newcastle and Carlisle, 1215*l.*; South-Eastern and Dover, 2661*l.*; Sheffield and Manchester, 464*l.*; York and North Midland, 1670*l.*—At the meeting of the Ulster Railway Company last week, a dividend of 15*s.* per share was announced from the balance of profits for the last half-year, which amount to 8754*l.*, the receipts having been 13,453*l.*, and the expenses 4698*l.* The sum set apart to be added to a depreciation or reserved fund was 1026*l.* 19*s.* 9*d.* The extension of the line to Armagh was discussed, including the junction at Portadown, but nothing definite was fixed, and it was understood the matter stands over till the next meeting, to be held in September.—Mr. T. Hutchinson, the eminent railway contractor, met his death last week on his way from the Sedgefield station of the Stockton and Darlington railway to the village of Morden, where he lived. He had a few glasses of whisky at the Sedgefield station, which is a public house, and in less than half an hour after he had left to walk home he was found with his head within the rails, and an engine with a train of 35 waggons had gone over his neck, right shoulder, and arms, which killed him in a moment. He has left a widow and six children.—On Thursday, special general meetings of the proprietors in the Eastern Counties and Northern and Eastern Companies were held. The meeting of the Northern and Eastern Company took place first—Mr. Paterson in the chair; who stated that the meeting had been specially convened in consequence of an application intended to be made to Parliament in the present session, for leave to bring in a Bill to enable the Northern and Eastern Company to make certain deviations in the proposed extension line to Newport. The draft of the proposed Bill was then read, and approved of. The chairman believed that the company would meet with no impediment to the extension, and that the Bill for amalgamating the interests of the Eastern Counties and Northern and Eastern Railways would be passed without opposition by the Legislature. The joint board of the two companies had determined to apply to Parliament in the next session to extend the Northern and Eastern Railway northward, from Ely to Lincoln, in such a direction as would best accommodate the traffic of the important towns of Wisbeach, Lynn, Spalding, and Boston, and which they believed would pay fairly for their cost, and add materially to the income of the main line. The proprietors in the Eastern Counties Company met afterwards, to consider a Bill now before Parliament to extend the line from the Northern and Eastern Railway at Newport by Cambridge and Ely, and from thence eastward to Brandon, and westward to Peterborough. The draft of the bill was read and agreed to. It asked power to raise 960,000*l.* for the purpose, and conceded certain privileges in favour of the University of Cambridge. The chairman intimated his belief that the bill for the amalgamation of the two companies would pass through the House without opposition, and concluded by announcing the determination of the board to apply to Parliament in the next session for a further extension of the line from Ely to Lincoln, by Wisbeach, Lynn, Spalding, and Boston.

IRELAND.

Dublin.—The *Dublin Evening Mail* recently stated that Sir R. Peel has declared that the patronage of the Irish Church shall only be bestowed on those clergymen who are favourable to the national system of education in Ireland. The *Standard* Ministerial paper has given this statement a positive contradiction, but notwithstanding this denial, the *Evening Mail* resolutely reasserts its statement respecting the receipt by Earl De Grey of the communication from the Prime Minister, prescribing to his Excellency certain terms upon which he is to be guided in his future distribution of church patronage; the terms being, that the support of the present system of national education is an indispensable qualification for ecclesiastical preferment.—The Repeal Association held its usual weekly meeting on Monday, in the Conciliation-hall. Mr. Castello, barrister, in the chair. A letter from Mr. O'Connell was read, announcing that he will be in Dublin on Monday next. The following is an extract from this letter:—"My appearance in England at this juncture has had these salutary and cheering results. Its consequences are — 1. That a great proportion of the sound and thinking part of the English nation have shown their strong and judicious conviction that justice has not been done us in the recent trials. 2. That such portion of the English nation are convinced we are victims of a monstrous perversion of law, and of the most undue practices with respect to the arrangement of the jury. 3. There is a similar conviction gaining ground that Ireland is misgoverned and oppressed, and that it is necessary for the honour and safety of the state that justice should be done to her. 4. My visit to this country has roused a spirit of inquiry, and a kindly disposition to sympathy, amongst great masses of the English people, who have been hitherto ignorant and careless of the fate and fortunes of Ireland. 5. It is demonstrated by recent events that the people of England, or, at least, all the valuable classes of society, are not partakers in the iniquities of the Government, but, on the contrary, are anxious that Ireland should be administered for in the spirit of justice and impartiality. 6. It is demonstrated that multitudes of the wise and the good in England are anxious to make the union a reality, by giving a perfect equality of rights to Ireland with those that are possessed by the English; whilst others, and they are not a few, have discovered that a local Legislature in Ireland, legislating for Irish purposes exclusively, would tend to consolidate the connexion between the two countries, and render a separation impossible." After the reading of this letter, Mr. J. O'Connell said that the Association had already expressed its appreciation of the good feeling lately displayed by the people of England towards this country, declaring at the same time the firmest determination to continue their efforts to work out the repeal. While he felt grateful for the sympathy which had been manifested, he could not avoid saying, that he thought it was time for England to awake from the apathy regarding Ireland, which had so long existed. He could make allowance for the human frailty which dissuaded men from taking much interest in matters which did not immediately concern themselves; but, he would ask, how was it possible that the prosperity of Ireland could militate against England? It was a blasphemy against Divine Providence to entertain such an idea, and the truth was, that the two countries had no interest in antagonism. But their perfect alliance could only be effected by the restoration to Ireland of her inalienable right of a domestic Parliament to watch over her interests. The rent for the week, inclusive of 114*l.* from America, amounted to 370*l.*—The Rev. Sir James King, of Weymouth, has handed over the 20*l.* which he intended as a present for Mr. O'Connell to bear a portion of his expenses in the late trial, to a charity in this city for the relief of poor debtors.—An official communication has been received from the Post-office, announcing the changes determined upon in the despatch and arrival of the English and provincial mails, commencing on the 12th of next month. On the morning of that day the English mail will be despatched at 20 minutes past 6 A.M., and will be due in London on the following morning. The night mail for Liverpool, which now leaves Kingstown at half-past 9 P.M., will be discontinued. The night mail from London will be due in Dublin an hour earlier than at present. The mails for the interior of Ireland will, on and after the 12th April, leave the Post-office at 8 P.M., instead of 9 o'clock.

Tipperary.—At Nenagh on Friday, two men named Leary and Cooke were tried for the murder of John Nowlan, near Roscrea, on the 9th June last. Nowlan was a cattle drover, and was found murdered on the high road. The case appeared to be one of highway-robbery and murder. A man named Maylan, a party concerned in the attack, was tried and convicted at a former assizes, and executed for the offence. The Jury were shut up all Friday night and did not seem likely to agree; on Saturday morning Mr. Justice Ball, who tried the case, sent for them and inquired if they had agreed? The Foreman—We have not, nor is there the least hope that we shall; we wish to be discharged. The Foreman added that he was treasurer of the savings bank, and the public would be very seriously inconvenienced if he had to remain all day; the Judge refused to discharge them. At ten o'clock at night the Jury came out and again solicited to be discharged, the Foreman saying that it was not unusual for Juries to be discharged after being confined for a whole night. Judge Ball then announced that the Judges had consulted upon this practice, and were unanimously of opinion that it was not lawful and must be discontinued; the letter of the law would in future be enforced in all such cases. Ultimately the Jury agreed in convicting one of the prisoners (Cooke), and were discharged without finding any verdict as to the other, in consequence of the illness of one of their number. Cooke was immediately sentenced to death.—On Saturday, Patrick Gleeson was tried for the murder of Thomas Tierney, on the 12th March, 1843. The murder was a peculiarly brutal one, the motive being supposed to be, that the unfortunate murdered man was to give evidence against a brother of the prisoner for some offence. A party of ruffians attacked him in the house of a neighbouring cottager where he was living with the family, and deliberately stoned him to death. The murder was committed on the evening of the Sabbath, and that morning, it appears, the priest had, in a manner, denounced the victim of this atrocity as a person likely to swear falsely. The only person who could identify the prisoner as one of the murderers was a girl of eleven years of age. Her evidence was very clear and positive, but the Jury acquitted the prisoner.

SCOTLAND.

Edinburgh.—On Monday the body of Mr. Kemp, well known as the architect of the Scott Monument, was found in the canal. He had been missing for twelve days previously, and was last seen at the house of Mr. Lind, contractor for the monument, on whom he had called to arrange about the progress of the works. It is supposed that, on his return home to Morningside, he had taken the way by the banks of the canal, and that the night being dark he had stumbled into the water at the place where he was found, an open and dangerous point beside Lochrin distillery.

Theatricals.

THE ITALIAN OPERA.—The first operatic trial of the season was made on Saturday, when Madlle. Favanti, or, in other words, our countrywoman Miss Edwards, formerly a pupil of the Royal Academy of Music, made her first appearance before the most formidable audience in Europe. Our readers are aware that her career in Naples had been a series of extraordinary successes, and on Saturday night the curiosity of the Opera public was excited to the utmost. The Opera chosen for the *debut* of Madlle. Favanti was "Cenerentola." No sooner did the curtain rise, than the audience gave one of those encouraging rounds of applause which are so well known in this country. The first part of her first duet was encored, and before the close of the first act, the audience were fully satisfied that a carefully cultivated vocalist was before them, with a voice remarkably fine in the lower region, the A below the staff being as full and sonorous as possible; but whether she could really achieve anything that would violently stir an Opera public was yet to be seen. She did this in the *finale;* and the solo, "Sprezzo quei don che versa," was an achievement of the most brilliant kind. The wonderful compass of her voice was here perfectly exhibited, and the truth and precision with which she touched the most distant intervals were admirable. This display of a most remarkable power of execution, and of a voice that reached from the lowest region of the *contralto* compass to the highest of the *soprano*, roused the audience to the greatest enthusiasm,

and after the descent of the curtain they called for her with the loudest acclamations. At the *finale* of the second act, "Non più mesta," that well-known *bravura*, on which the composer, not leaving the choice of embellishment to his vocalists, has lavished all sorts of ornaments, was another success. The brilliant passages she executed in a style which made it a beautiful specimen of the florid style of singing. As soon as it was concluded, *bouquets* were showered from several boxes; and the curtain had no sooner fallen than it was raised again for the repetition of this concluding portion of the *finale*, in compliance with the vociferous demand of the audience. After the close of the Opera, considerable anxiety was occasioned by the fact of the young *débutante* having, whilst leaving the stage, fallen down apparently lifeless. With the assistance of Mr. Wardrop she was, after some time, recovered. The nervous excitement from which she was suffering fully accounted for this occurrence; but, notwithstanding the disadvantage under which her anxiety placed her in the eyes of the audience, her success was complete, and she achieved difficulties worthy of a *prima donna* well accustomed to the Opera boards. A vocalist of such extraordinary natural powers has, perhaps, rarely been seen by any audience in this metropolis, and her management of those powers is scarcely less extraordinary. — Signor Fornasari, the new tenor, who had deservedly become a favourite with the Opera public, is now suffering so severely from water on the chest as to prevent his singing, and it is in contemplation to send for Tamburini, who will shortly be in Paris.

Law.

ASSIZE INTELLIGENCE—OXFORD CIRCUIT, HEREFORD.—*Bellers v. Chalk and Holl.*—This was an action for libel brought by the plaintiff, Wm. Bellers, Esq., of Barnard's-green, Malvern, against the defendants, who are the proprietors and publishers of the *Worcester Herald*.—The libels in this case were of an unusual character. On the 2d December an article appeared in the defendant's paper headed "Extraordinary Conduct to Horses," charging the plaintiff with cruelty to a horse, in confining it in a place so small that it could not turn round or lie down without excoriating its sides in a dreadful manner. The reason for such treatment of the animal was stated to be in consequence of a cruel determination taken by the plaintiff some years before, when the mare threw him, and he then said, swearing, "I'll make you suffer for this; I'll put you in solitary confinement for seven years." This was communicated to them by a person who was present at the time. After making this statement, the defendants then proceeded to comment on his conduct at some length. In this article no name was mentioned, but a threat was held out that unless the "inhuman man's tardy sense of justice had a proper effect upon him, his name should be held up to that scorn and contempt his conduct deserved." In consequence of this paragraph, Mr. Yewens one of the Secretaries of the National Animals' Friend Society, went to Worcester and saw Mr. Chalk, who told him that the person alluded to was Mr. Bellers, and that he had received his information from Colonel Bland. Mr. Yewens went to the plaintiff, who immediately showed him his mare, which with the exception of some marks occasioned by her having attempted to strangle herself with a halter, was in good working condition. Mr. Yewens went to Mr. Chalk again, and told him he thought he had been misled, as the plaintiff had satisfied him there was no foundation for the charge. However, on the 16th, the defendants reiterated the charge, and on the 23d published another article in which the name of the plaintiff was mentioned, and some very strong remarks made on him. A meeting for aiding the Society for the Prevention of Cruelty to Animals was a few days after held at Gloucester, the Bishop in the chair, when Mr. Thomas, the secretary to the Society, asserted that Mr. Bellers had been guilty of the conduct imputed to him by the defendants. This speech of Mr. Thomas was published by them in their next paper. Mr. Yewens was examined, and stated that after making every inquiry, he was convinced the charge was not well founded. The Rev. G. Williams, vicar of Wrehenford, and Capt. C. Beauchamp, gave plaintiff an excellent character for retired habits, humanity, and kindness, and family connexions, being a near relative to the Rev. R. Vernon, of Wimbleton. Mr. Sergeant Talfourd addressed the Jury in mitigation of damages, the defendants having pleaded Not Guilty, but put no plea of justification upon the record. Mr. Baron Parke having addressed the Jury on the question of damages, they retired, and on their return into Court, in about an hour, delivered their verdict for the plaintiff —Damages, 150*l*.—SHREWSBURY.—*Joseph Willets*, aged 17, was indicted for having, on the 16th February last, feloniously set fire to a barn and stacks of hay, wheat, and clover, the property of Joseph Morris, of Redhill-farm, in the parish of Hales Owen, Salop. The Jury, after a short time spent in deliberation, returned a verdict of Guilty. Mr. Baron Parke, in passing sentence, observed that the crime of which he had been found guilty was but a very few years ago punishable with death, and that if the law which had been altered had been still in force, the case was one in which its extreme penalty would, so far as he was concerned, certainly have been inflicted. He was almost tempted to say, so strongly did he feel with respect to the enormity of the offence, that he regretted that any alteration had been made in the punishment awarded by the law. He should pass upon the prisoner the most severe sentence which the Legislature permitted him to inflict, not with any hope of reforming the prisoner himself, who at so early an age had shown so much depravity, but with the object of deterring others from the commission of similar crimes. The sentence was, that he be transported beyond the seas for the term of his natural life.—MONMOUTH.—*Thomas Thomas*, a young farmer at the Hendy, at Pen Graig-Bargoed, was charged with having wilfully murdered Mary Jones, his infant child, on the 16th November last, at Monydtnuslone, in this county. It was proved that the prisoner took the child (which was illegitimate) from the mother, stated that he had nursed it, and received some money from the mother to pay the expenses; that the child was found drowned in the canal, having been tied up in a sack with a tram plate of 30 lbs. weight, and that the spot where it was found was not far from the place where the prisoner was last seen with the child alive. Additional evidence was adduced to show that the prisoner expressed great apprehension lest the mother should say that he had the child from her, in which case he said he should certainly be hanged; adding, that if he ran away, he should assuredly be taken. Many other circumstances were related, which tended materially to implicate the prisoner, and to confirm the testimony of the principal witnesses. Serjeant Talfourd having addressed the Jury at considerable length for the prisoner, Baron Parke summed up, the Jury retired for about half an hour, and brought in a verdict of Not Guilty.

NORFOLK CIRCUIT, HUNTINGDON.—*Gifford White*, aged 18, was indicted for unlawfully, knowingly, and feloniously sending to Mr. Isaac Platt a letter, threatening to burn him and the other farmers of the parish of Bluntisham in their beds, and also to burn their property. Prisoner pleaded Guilty. Prosecutor is a farmer living in the parish of Bluntisham, in this county, and prisoner in December last was a labourer in husbandry in the same place. On the 28th of that month one of the female servants of the prosecutor found a sealed letter inside his farmyard, directed—"To the Farmers of Bluntisham, Hunts." She took it to her master, who opened and read it; it was in these words:—"Bluntisham, Hunts. *To the Farmers*. We are determined to set fire to the whole of this place if you don't set us to work, and burn you in your beds if there is not an alteration. What do you think the young men are to do if you don't set them to work? They must do something. The fact is, we cannot go any longer. We must commit robbery and everything that is contrary to your wish. I am, 'AN ENEMY.'"—Lord Abinger, having ordered that the plea of the prisoner should be recorded, proceeded to pass sentence. The prisoner, his Lordship observed, had pleaded guilty to the commission of a crime of the greatest magnitude and enormity, and one of which the Legislature had most properly marked its sense by the severity of punishment it had annexed to it. Of what use was it that men should join together in the bonds of civil society, if there was no security for life and property, if men could not sleep in peace and a sense of security, but were to live in a state of constant terror and alarm? The conduct of the prisoner was calculated to hold the district in which he lived in continual terror, and it was not to be endured in a country in which law prevailed that men should endeavour to compel others to do that which might be against their interest or their duty by threats of suffering from loss of property, or of submitting to death by the most horrible torments. The offence was of a most atrocious character, and it might indeed almost be said, that the sending of letters threatening to burn the property of the parties to whom they were addressed was worse than the putting the threat itself into execution, for when a man lost his property by fire he at least knew the worst; but he to whom such threats were made was made to live in a state of continual terror and alarm. Such a state of society was intolerable, and in order that the well-disposed part of society might sleep not only in security, but in a sense of security under a well-founded trust in the laws, and others be deterred from a repetition of the offence of which the prisoner had admitted his guilt, he must receive the extreme measure of punishment which the law had annexed to his crime, which was, that he be transported beyond the seas for the remainder of his life.—CAMBRIDGE.—*John Searle* was indicted for the wilful murder of William Garner on the 1st of February. The deceased was a farmer in the parish of Willingham, in which place prisoner carried on the business of a miller. They were at the Vine Inn on the evening of the 1st February, and some angry words passed between them respecting the prisoner's wife. She was at that time living apart from her husband, and the deceased taunted him with the fact, and said he knew where the wife was better than her husband did himself. The prisoner made some reply, which the witnesses did not understand, and the matter died away. Gradually the company fell off, and the prisoner and the murdered man were the only persons left. After sitting together for a few minutes the prisoner left the house, and the deceased followed in a quarter of an hour. Before his death deceased made the following statement which sufficiently explains what followed:—"As soon as I had got three or four paces from the door, John Searle started out from behind the gate and took me unawares, and knocked me down by a blow on the temple, and when I was on the ground the man kicked me as hard as he could about the head and body. I begged him not to murder me, but he said he would, he certainly would, and I prayed to him like a child not to kick me any more, but he swore he would murder me before he left. And when he had done so for some time he went away, first walking and then running off; and as soon as I got my senses back, for they had left me, I crawled back to the Vine, and the people took me in." It appeared from the evidence of the surgeons, that the blows and kicks which the deceased received, had affected the nervous system in an extraordinary degree, and brought on *delirium tremens*, which was the immediate cause of his death. The Jury immediately returned a verdict of *Guilty* of manslaughter, and the prisoner was sentenced to be transported for 15 years. —*William Moss*, aged 20, was indicted for feloniously cutting down 300 trees and shrubs, the property of Mr. W. Read, and growing in his garden. The prosecutor is a gentleman farmer living at Whittlesea, and is celebrated for the beauty of his garden. He is the leader of the Horticulturists in the Fens, and it appeared had carried off the best prizes for flowers and fruits in many contests. One morning early in June, his gardener brought him the alarming intelligence that some scores of his young fruit-trees and shrubs, and the whole of his carnations and other flowers, had been either rooted up or cut down, and that the choice portion of his garden was an entire waste. It was so, but all attempts to discover the perpetrator of this gross outrage were ineffectual, although a handsome reward was offered, and the police took very active measures to assist the prosecutor. Months passed away and nothing was heard of the criminal. Early in the present year, one Pridmore, a tinman at Whittlesea, gave information which led to the apprehension of the prisoner, who had been apprenticed to him. Mr. Read upon his examination proved the fact of the trees having been destroyed. Upon his cross-examination he said he had no knowledge of the prisoner, who could have no malice towards him. With respect to Pridmore, however, he had once been summoned by that person for "shooting" at his bees, but the justices dismissed the complaint and made Pridmore pay the costs. On another occasion he had summoned Pridmore for shooting at a pigeon said to belong to him. The evidence of this Pridmore and his wife was to the effect, that on the night on which the offence was committed the prisoner expressed to the Pridmores his determination to give prosecutor a turn, and to cut down his trees and flowers. For this purpose he borrowed Pridmore's hatchet, and made everything ready to carry out his resolve. Pridmore went to bed, leaving the prisoner and his wife up, the latter alleging, as her excuse for being up, that she was "stoning raisins," a job which she could give no satisfactory reason for not performing by daylight. Presently the prisoner asked his mistress where the dusters were, and she pointed to a cupboard and nodded her head. The prisoner then, according to her account, took a couple of dusters from the cupboard, tied them over his shoes, took up his master's hatchet, and sallied forth on his malicious errand. In half an hour he returned and informed Mrs. Pridmore that he had served the prosecutor out. The prisoner's apprenticeship having expired soon after this transaction, he left Whittlesea, and after six months' lapse his late master gave information against him, induced by some letter he had received from the prisoner's father. Mr. Prendergast having addressed the jury with great indignation at the conduct of the Pridmores, Mr. Justice Patteson asked them if they could believe the evidence they had heard? The Jury said they could not, and immediately Acquitted the prisoner.

HOME CIRCUIT, KINGSTON.—*James Elsley*, a labouring man, was indicted for the wilful murder of James Edwards, Lord Grantley's game-keeper, on the 6th Jan. last, on the banks of the Wey and Avon canal. The particulars of this case appeared in this paper at the time. After a long examination, the Jury found the prisoner Guilty of Manslaughter, and the Judge, after observing that the prisoner had reason to be extremely grateful for the lenient view the Jury had taken of the case, sentenced him to be transported for life.

MIDLAND CIRCUIT, LEICESTER.—*William Beckwith*, and *Reuben Waldrom*, were charged with being out on the 29th of February, about eleven at night, entering with divers persons unknown into a close in the occupation of Benjamin Hill, to take game. Richard May, gamekeeper to Mr. Flood, of Bardon-park, proved he was on duty on the morning of the 1st of March. Observed some men go by his house, and, suspecting they were poachers, he got up, calling other men to his assistance. As he advanced, the poachers began to throw stones. The prisoner Beckwith threw one that hit the prosecutor on the breast. He had a stick also, with which he struck May a fearful blow on the head. Another witness identified Waldrom as being one of the party who assisted in beating the prosecutor. Beckwith was taken on the spot. Waldrom escaped, but was afterwards taken. A previous summary conviction by the magistrates was proved against Beckwith, who was sentenced to fifteen months' imprisonment and hard labour, and Waldrom to twelve months' imprisonment and hard labour.—*Thomas Kirby*, *Thomas Rodwell*, *Joseph Rodwell*, and *John Porter*, were charged with having, on the 25th November, assaulted John Laxton and James Farley, with intent to do them grievous bodily harm. Laxton, one of the watchers on Mr. Hartoffe's estate at Burton Lazors, proved being out with James Farley on the morning in question, between six and seven. They saw five men and two dogs, one being a very light one, and what they call a snap dog. One of the men had a bag on his shoulder, which Laxton touched, thinking it contained game or nets. An assault was immediately commenced upon him, and he was beaten about the head until he became insensible, and was smothered with blood from the head to the feet. Two of the prisoners were positively sworn to as being of the party of five on the morning in question. The other two men were seen, in company with Kirby and one of the Rodwells, coming in a direction from the spot in question. Mr. White admitted their identity, but contended the assault would not have taken place had not Laxton, in the first instance, touched the bag on Kirby's shoulders. They were found guilty, and sentenced to twelve months' imprisonment each, and hard labour.

SOUTH WALES CIRCUIT.—CARMARTHEN.—*Thomas Jones*, *David Jones*, and *Francis Davies*, were brought up to receive sentence for a burglary committed in the parish of Moddrey. They had pleaded guilty to the charge and were sentenced, Thomas Jones and David Jones to ten years' transportation, and Francis Davies to one year's imprisonment.—*John Harris*, *David Thomas*, *David Williams*, *Job Evans*, *Isaac Charles*, and *John Lewis*, all of whom had been found guilty of a riot at the Carmarthen workhouse, were sentenced as follows:—John Harris to one year's imprisonment, with hard labour, and the rest to eight months' imprisonment.—*Thomas Hughes*, *John Jones*, and *Benjamin Jones*, for demolishing the Pontarlleche toll-gate, to one year's hard labour. —*David Lewis*, *Jonathan Jones*, *Howell Lewis*, *Jonathan Lewis*, and *David Davies*, convicted of a riot at Tallog, eight months' hard labour each.—*David Thomas*, *John Jones*, *Evan Davies*, *John Thomas*, *Thomas Thomas*, *John Thomas*, and *David Evans*, for a burglary at Pontyfar, sentenced, David Thomas to transportation for 20 years, and the whole of the others to transportation for 10 years. After the passing of the sentences a distressing scene took place in Court; the families of the transports threw themselves into a perfect frenzy of grief. Sobs and cries were heard on all sides, and there was scarcely a dry eye in the Court.

POLICE.—MANSION HOUSE.—THE WILL FORGERIES.—On Saturday there was a great assemblage of people at the Mansion-house and its vicinity, in consequence of the expectation that all the parties accused of the will forgeries would be brought before the Lord Mayor and committed for trial. The curiosity was increased by the general belief that Lydia Sanders, *alias* "Emma Slack," who pretended to be a relative of Miss Anne Slack, and administered to the fictitious will by means of which the money was obtained from the hands of the Commissioners for the reduction of the National Debt, would arrive in London in time to be brought up for examination with the rest of the accused parties. Emma Slack, however, was unable to travel, having sustained so severe a shock in consequence of having, together with her husband, fallen into the hands of John Forrester, the officer, as to be wholly unfit for even the slight toil of travelling by railroad. The other prisoners, however, were placed at the bar. Mrs. Dorey, who was attended by her husband, entered with a faltering step, and was placed in a chair. Fletcher, Barber, Griffin, and Sanders were placed behind the bar. Mrs. Dorey, upon turning round and seeing the husband of her sister, "Emma Slack," sobbed hysterically, and became the object of the greatest interest in the room. A long discussion ensued on various points, and at length the prisoners were remanded for a week.—On Monday Mrs. Sanders was brought up and identified, and remanded, in order that she may again appear with the other prisoners.—The apprehension of Mr. and Mrs. Sanders will no doubt operate as a warning to others who may be tempted to engage in fraudulent undertakings under the supposition that they may not be discovered. In the case of these forgeries, so determined were those engaged for the prosecution to discover and apprehend the parties implicated, that in the early stage, before the officers could be put upon the track, all persons in any way connected with Mr. and Mrs. Sanders, either in London or the country, were so closely watched, that they could not leave their homes, or attempt any communication, personally or by letter, without the knowledge of the solicitors for the prosecution, and steam, railway, and animal speed was at the control of those employed in the plan of detection; not a day elapsed without producing one or more communications from Bristol or elsewhere respecting the result of every movement; and the two Forresters were day by day attending the offices of the solicitors for the purpose of reporting from time to time the progress of the investigations, and receiving fresh instructions. Their labour in sifting these transactions has been enormous; and it is said that they have been frequently aroused in the night in consequence of the arrival of special messengers from different parts of the country.

SPORTING.

TATTERSALL'S.—EPSOM SPRING MEETING (YESTERDAY.)—*The Trial Stakes.*—Sir G. Heathcote's Akbar, 3 yrs., beat by a length; Lord G. Bentinck's Emma, 3 yrs.; Gaiety, Hopeful, Curate, Mespelus, Nininkin filly, and Midas. Sweepstakes of 5 Sovs. each, won, in two heats, by Lord George Bentinck's Croton Oil, 3 yrs., beating Moustache, the Shirine colt, and Nora Creina. Wright, Esq., of Maldeth-hall, Lancashire, to HELEN MONCREIFFE, eldest daughter of the late Sir David Moncreiffe, of Moncreiffe, Bart.—23d inst., at St. John's, Hackney, Mr. J. S. BOLTON, of St. Paul's Churchyard, to EMILY L. COOKE, youngest daughter of Mr. J. Cooke, of Cannon-street, City—26th inst., at Speldhurst, Kent, H. GORDON, Esq., only son of Sir Orford Gordon, Bart., to ELLEN

BARNEWALL, youngest daughter of the late B. Barnewall, Esq., of Weymouth-street, Portland-place.

DIED.—29th Dec., 1843, killed in action, at Maharajpoor, Lieut.-Col. E. SANDERS, C. B., of the Bengal Engineers, Deputy Military Secretary to the Government of India. He had volunteered during the day, and fell while leading a body of H.M.'s 40th Regiment to charge a battery of the enemy's guns—Lately, W. C. MURPHY, Esq., eldest son of W. Murphy, M.D., Cork. He was an undergraduate of Cambridge. He held a Scholarship and the Wortley Exhibition for Moral Philosophy in Gonville and Caius College—8th inst., W. G. CROSVELT, Esq., after a few hours' sudden illness, at Rome—20th inst., at Wootton, near Woodstock, ALFRED THOMSON, third son of the late C. Thomson, Esq., Master in Chancery, aged 38—21st inst., at Sible Hedingham, Essex, MARY M. FOWKE, the widow of the late Rear-Admiral George Fowke—21st inst., at Hastings, J. HOLLINGBERY, Esq., only son of the late Rev. D. Hollingbery, of Winchelsea, Sussex, Chancellor of the diocese of Chichester, and Prebendary of St. Paul's Cathedral—21st inst., J. RAVEN, Esq., of Bocking-hall, Essex, aged 65—22d inst., MARY ROEBUCK, relict of the late John Roebuck, Esq., of the Royal Crescent, Cheltenham, and Painswick, Gloucestershire, aged 66—23d inst, at his residence, Grove, Camberwell, J. TAYLER, Esq., formerly of Clapham—23d inst., at Kemp-town, Brighton, JESSY KENNEDY, wife of H. Kennedy, Esq., aged 36—24th inst., at the house of her daughter, Mrs. Hilton, Grove lane, Camberwell, Mrs. SYDENHAM, the relict of the late H. Sydenham, Esq., aged 92—25th inst., at Chelmsford, ELIZABETH COPLAND, wife of J. Copland, Esq.—25th inst., at his residence, Madeley Villas, Kensington, M. JONES, Esq., late of the Island of Jamaica, aged 75—25th inst., at his residence at Edmonton, after an illness of seven months, Mr. R. WATTS, Oriental Printer and Typefounder, who for many years was most extensively engaged by the various Religious and Literary Societies, aged 71—26th inst., Mr. G. RUTHVEN, aged 52, one of the old Bow-street officers, who had been attached to the police force 30 years, and had been superannuated for some time. Among his many notorious captures may be reckoned those of Thistlewood, for the Cato-street conspiracy; the taking of Thurtell, the murderer of Mr. Weare; and the discovery of Bank robberies and forgeries on Government to an enormous amount.

FELIX SUMMERLY'S HOME TREASURY OF BOOKS, PICTURES, TOYS, &c.; purposed to cultivate the Affections, Fancy, Imagination, and Taste of Children.

TAYLOR and WALTON and all Booksellers.

One Volume, price 7s. 6d.

THE LIFE AND TIMES OF RIENZI.

Not less interesting than Sir E. Lytton Bulwer's eloquent Romance, and scarcely less romantic, is this historical record of the Conspiracy of Gabrini."—*Monthly Repository.*

"To all who have read Sir E. Lytton Bulwer's 'Rienzi,' its perusal is, in a measure, a duty."—*Spectator.*

"A curious and pleasing volume, and full of matter of historical character and illustration."—*Literary Gazette.*

"The publication of this work is well timed . . . . The Life of Rienzi is to us full of interest."—*Athenæum.*

"Those that wish to become acquainted with the true history of a man, who was, in some sort, the *Napoleon* of his own age and country, would do well to consult the extraordinary narrative of the 'Life and Times of Rienzi.'"—*Tait's Magazine.*

London: WHITTAKER and Co

TWENTY YEARS' LOSS of HAIR, and WONDERFUL RESTORATION. Church-street, Whitby, Oct. 19, 1841.——Gentlemen,—Of the last supply of OLDRIDGE'S BALM OF COLUMBIA every bottle was sold immediately on receipt, and I have many more bespoke, only waiting for a further supply, which I hope you will send without the least delay. Orders have poured in more than ever since the powerful effects of the Balm have been so decisively demonstrated in the cases of several credible and respectable inhabitants of the town. One instance, among others which have attracted particular attention, is the case of a gentleman who had had little or no hair for 20 years; he had tried numerous preparations in vain, and ultimately had his head shaved, and wore a wig. At my recommendation he tried the Balm; and after using it according to the directions for a short time, the young hair appeared, and he has now as fine a head of hair as any person in Whitby. Yours, &c., JOHN KILVINTON.—To Messrs. Kennaby, Brothers, 10, Westmoreland-buildings, Aldersgate-street, London.

OLDRIDGE'S BALM prevents the hair turning gray, produces a beautiful curl, frees it from scurf, and stops it from falling off; a few Bottles generally restore it again. Price 3s. 6d., 6s., and 11s. per bottle. *No other prices are genuine.* Ask for OLDRIDGE'S BALM of COLUMBIA, 1, Wellington-street, Strand.

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the Public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the Apparatus; and B. and H. can safely recommend it from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices, to 130, Fleet-street.

BULB CUCUMBER-GLASSES, for Watering by Evaporation during the growth of the Fruit, 2s. 6d. to 3s. 6d. each; GRAPE-GLASSES, with holes, 1s. 9d to 2s. 6d. each; BEE-GLASSES, 1s. to 2s. 6d. each. Cylindrical CUCUMBER-TUBES, from 6d. to 4s. each; PROPAGATING-GLASSES, Green, 1s. per lb.; white, 1s. 2d. per lb.; or 2s. 6d. to 24s. per dozen; FISH-BOWLS, from 1s. 6d. each; ditto, with hole in the bottom for Fountains, 2s. 6d. per lb., at APSLEY PELLATT'S Falcon Glass Works, Holland-street, Blackfriars. Orders from the country, accompanied with a Post-office order, will meet with prompt attention.

SILVER TEA-SERVICES.—A. B. SAVORY and SONS, Manufacturing Silversmiths, 14, Cornhill, London, opposite the Bank of England, submit the price of the following Silver Tea and Coffee Services. The Cottage Pattern is plain, standing on shell feet, the tea and coffee-pot with a flower ornament on the lids. The King's Pattern is richly embossed with flowers and scrolls. The shape of either is new and elegant.

Cottage Pattern.		*King's Pattern.*	
Strong Silver Tea-pot	£12 0s	Strong Silver Tea-pot	£12 0s
Ditto Sugar-basin	6 16	Ditto Sugar-basin	7 10
Ditto Milk Ewer	4 10	Ditto Cream Ewer	5 10
Ditto Coffee-pot	15 0	Ditto Coffee-pot	15 0
Complete....	£38 6	Complete....	£40 0

A variety of upwards of 50 tea and coffee services may be seen in the show rooms, where may be selected every article of silver requisite for the side-board or plate-chest. Pamphlets of prices, illustrated with sketches of the various articles, gratis, and forwarded, postage-free, to any part of the kingdom.—A. B. SAVORY and SONS, 14, Cornhill, London, opposite the Bank of England.

BERDOE'S SUPERIOR REALLY WATERPROOF FROCKS, for the present season. An extensive variety of the above, in NEW and greatly-improved materials (in lieu of the unsightly rubbish made by slopsellers), now ready, guaranteed to exclude any rain whatever; and confidently recommended to those who regard a respectable appearance, or wish to avoid disappointment and vexation. FIRST-RATE CLOTHING of every description upon the lowest terms possible, consistent with TRUE economy, and ultimate satisfaction. W. BERDOE, Tailor, Waterproofer, &c., 69, Cornhill, (North side.)

METCALFE'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most effectual and extraordinary manner, and is famous for the hairs not coming loose—1s. An improved Clothes Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh Brushes, of improved graduated and powerful friction. Velvet Brushes, which act in the most surprising and successful manner. The Genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE'S Sole Establishment, 130B, Oxford-street, one door from Holles-street.

Caution—Beware of the words "From Metcalfe's," adopted by some houses.

A SINGLE BOTTLE OF BETTS'S PATENT BRANDY may now be obtained in a perfectly genuine state. This convenient arrangement for both vendor and purchaser, and their mutual security against deception, is effected by the use of BETTS'S PATENT METALLIC CAPSULE, made of pure and SOLID METAL, (not Tin Foil) which completely encloses the cork and mouth of the bottle, and is embossed with the words "BETTS'S PATENT BRANDY, 7, SMITHFIELD BARS," the *fac-simile* of which is engraved on a label affixed to each bottle.

In the present day it is impossible to produce anything new and useful without exciting the cupidity of imitators. Already attempts are made to mystify the identity of the original and genuine article, by foisting upon the public the contents of bottles having a Tin Foil covering, falsely denominated "a neat metallic capsule." J. T. BETTS & Co. therefore deem it essential to impress upon purchasers the absolute necessity of comparing the embossed Capsules with the Labels, as an infallible mode of detecting fraudulent substitutions.

BETTS'S PATENT BRANDY, thus protected, may be obtained of the undermentioned Wine and Spirit Merchants, at 3s. 6d. per Bottle, Bottles included; or at 18s. per Gallon, as heretofore, at

Bishopsgate Street	W. Stevens, Nos. 78 and 80.
Bayswater	Charles Simpson, 22, Bayswater Terrace.
Blackfriars Road	S. Silcock, No. 1.
Brixton	S. Hawks, Brixton Washway.

FURNISHED COTTAGE or APARTMENTS WANTED.—A Parlour, three Bed-rooms, and a Kitchen, with Garden, in a rural situation, within 10 miles of London, in Surrey or Kent, near to a railway station or steam-boat pier, for four or six months, at a moderate rent. A Farm-house or Gardener's house preferred.—Direct, post-paid, A. H. Z., 64, Bankside.

ROWLAND'S ODONTO, OR PEARL DENTIFRICE, patronised by "HER MAJESTY," H.R.H. Prince ALBERT, the Royal Family, and the several Courts of Europe. A FRAGRANT WHITE POWDER, prepared from Oriental Herbs of inestimable virtue, for strengthening, preserving, and cleansing the teeth. It eradicates the factitious formation of tartar, and by the removal of that extraneous substance leads a salutary growth and freshness to the gums. It removes from the surface of the teeth the spots of incipient decay, polishes and preserves the Enamel, substituting for discolour and the aspect of impurity the most pure and pearl-like whiteness; while, from its salubrious and disinfecting qualities, it gives sweetness and perfume to the breath, bestowing at once cleanliness, and the appearance and reality of health. Price 2s. 9d. per box, duty included.

CAUTION.—To protect the public from fraud, the Hon. Commissioners of Her Majesty's Stamps have authorised the Proprietors' Signature to be engraved on the Government Stamp thus—A. ROWLAND and SON, 20, Hatton Garden, which is affixed to each BOX. Ask for ROWLAND'S ODONTO. Sold by them, and by Perfumers and Chemists.

*** All others are SPURIOUS IMITATIONS.

BEE-HIVES.—GEORGE NEIGHBOUR & SON beg to inform their Apiarian friends that they have prepared for the season a large supply of "Nutt's Patent Bee-hives" (for the sale of which they are the only authorised agents), in which are embodied all the recent improvements. Their selection now comprehends most varieties in general use at the present time, including the "Single Box Hive," the "Ladies' Observatory Hive," the "Improved Cottage Hive," with glasses, &c., from either of which the produce may be taken at any time of the gathering season, without destroying the Bees.

G. N. & SON have also Glass Hives, and other articles connected with Bee management, a catalogue of which, with drawings, may be obtained. Letters of inquiry must have postage stamps inclosed.—Apiarian Depot and Honey Warehouse, 127, High Holborn, London.

NUTT ON BEES, Fifth Edition, now Published.

SEED TRADE.

WANTED immediately, a SHOPMAN, well acquainted with the business; one who has been used to travel would be preferred.—Apply by letter to W. J. NUTTING, 46, Cheapside.

WANTED an intelligent active young Man as good plain Gardener, who thoroughly understands all the routine of a Kitchen Garden, the Pruning of Fruit-trees, and the Management of Hotbeds.—Apply at Messrs. JACOB WRENCH and SONS, London Bridge. Wages moderate.

WANT PLACES.—All Letters to be post-paid.

AS HEAD GARDENER.—A young married Man, who well understands the management of Vines, Pines, and Framing of every description, and is, moreover, proficient in all the branches of his business; his Wife being competent to manage a small Dairy, if required.—Direct to Messrs. WM. WOOD and SON, Nurserymen, Maresfield, near Uckfield, Sussex.

AS HEAD-GARDENER.—A respectable middle aged Man, who can give satisfactory reasons for leaving his situation, and whose present employer, as well as numerous gentlemen to whom he is well known as a very successful grower of Pines, Grapes, Orchidaceæ, &c., would be ready to give him testimonials of first-rate abilities as a general Horticulturist and Gardener.—Direct to R. P., at WHITE and Co.'s Nursery, Poole.

AS GARDENER.—A young Man who has had upwards of 14 years' experience in the practice of Gardening, and is well acquainted with the various branches of the profession; the most satisfactory references can be given.—Direct to A. R., at Mr. Rowsell's, Clay Hill, Enfield.

AS GARDENER.—G. MILLS, Gardener, Gunnersbury-park, Acton, Middlesex, has a young Man, 27 years of age, who has served him 2 years in the different departments of that establishment. He would feel great pleasure in recommending him to any nobleman or gentleman in want of a Gardener, as a competent and trustworthy servant.

AS GARDENER, where one or more Men are kept.—A young Man aged 34, of respectable habits, who has had great practice in all the superior branches of Gardening, and is capable of taking the management of any collection of plants; has no objection to the charge of meadow land, or to reside in any part of the United Kingdom. He can have an unexceptionable character from the gentleman he has lived with.—Direct to A. G., at Barton's Post-office, Holloway.

AS GARDENER.—A married Man, aged 28; has been in some good establishments in Scotland, likewise in England; has a proper understanding of his business in all its branches, and can have three years' good character from where he has just left.—Direct to C. H., Bedford Nursery, Hampstead-road.

AS GARDENER.—A single Man, 26 years of age, who thoroughly understands his business in the Kitchen and Flower Garden, Forcing, and Framing, and has a thorough knowledge of Pines and Grape-growing. Can have an unexceptionable character from the gentleman he last lived with two years.—Direct to E. C., care of Mr. BROWN, Nurseryman, Hampstead Road.

AS GARDENER.—A Married Man, who thoroughly understands his business; has no objection to make himself useful. His character will bear the strictest investigation.—Direct to A. B., Messrs. LODDIGES, Nurserymen, Hackney.

AS GARDENER, a Married Man, aged 36, without encumbrance, who thoroughly understands his business, with land and stock, if required; can have five years' character, and be strongly recommended by the gentleman he has just left. Direct J. P., Mrs. Thomson, Baker, Marlborough Road, Chelsea.

AS BAILIFF.—An active Man, aged 35, wishes to engage himself with a Nobleman or Gentleman, as Bailiff. He is a good Accountant, and perfectly understands the Kentish system of Agriculture in all its branches; can have an unexceptionable character from a Nobleman, his late employer.—Direct to Y. Z., at Mr. Thomas Mills, Farmer, Edenbridge, Kent.

AS COACHMAN, or as GROOM and GARDENER.—A respectable Married Man, aged 28 years. Can have a good character from the situation he is about to leave.—Direct A. B., Post-office, Sandhurst, Kent. A Gardener's place would be preferred.

TO LANDED PROPRIETORS, AGRICULTURISTS, &c.

AS AN OVERLOOKER OF LABOURERS.—The son of a gentleman, who has been trained to Agricultural pursuits, although not sufficiently experienced to cultivate a Farm himself, would be found very useful on any property in the above capacity. No salary is expected, but a comfortable lodging on the premises. References of the first respectability can be given.—Direct to A. C., Post-office, Curzon-street, Mayfair, London.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—SOUTHAMPTON MEETING.—Prize-Sheets and Regulations for the Exhibition of Stock, Implements, &c., together with the blank Printed Forms of Certificate required to be filled up by Exhibitors, and copies of the printed Programme of the Meeting, may be had on application, either personally or by letter, addressed to the Secretary, No. 12, Hanover-square, London.

Exhibitors are particularly requested to observe, that all Certificates for Implements, &c., must be sent, complete, so as to reach the Secretary on or before the FIRST OF MAY; and all Certificates for Stock on or before the First of June.

By order of the Council, James Hudson, Secretary.

London, March, 1844

CHOICE PANSIES.

J. HENCHMAN begs to inform cultivators of the PANSY that he is now sending out healthy plants of six good seedling varieties, for 21*s*. the set. Also a few choice kinds at 15*s*. and 18*s*. per dozen.—Edmonton, March 1844.

WOODLANDS NURSERY, MARESFIELD, near Uckfield, Sussex

WILLIAM WOOD AND SON have much pleasure in acquainting their numerous Patrons and Friends that they have been appointed Agents for the sale of that most invaluable article—WHITNEY'S CHEMICAL TRANSPARENT WATERPROOF COMPOSITION, samples of which may be seen, and the composition in use, at Wood and Son's Nursery. Sold in bottles, with ample directions for use, pints 2*s*. 6*d*., quarts 4*s*. 6*d*. each. Discount to the Trade.

SEEDLING FUCHSIA, CACTUS, and PANSY, HOLLYHOCK SEED, &c.—LYNCOMBE VALE NURSERY, BATH.

J. KITLEY begs to inform the Nobility, Gentry, and the Public that he has purchased of Mr. Pond his unequalled SEEDLING FUCHSIA (PONDII), allowed by all who have seen it to be one of the largest and handsomest Fuchsias of the day; tube and sepals bright crimson, with darker corolla, and extremely free bloomer; fine compact habit; cannot fail to give satisfaction. 5*s*. per plant.

J. K. has a few more plants of fine SEEDLING CACTUS (SPECIOSA SUPERBA), 10*s*. 6*d*. per plant. Also, good healthy plants of his SEEDLING PANSY (LYNCOMBE VALE RIVAL). This Flower, both for shape and decision of colour, is decidedly the best light PANSY out. 3*s*. 6*d*. per plant.

J. K. can recommend his HOLLYHOCK SEED, with the greatest confidence, having taken great care to select from his best full and very double Flowers of 1843 20 distinct varieties, named to colour, which he will forward to any purchaser post-free, on the receipt of a Post-office order for 5*s*. The whole of the above are now ready to send out.—Bath, April 5, 1844.

WILLIAM MILLER begs to direct attention to his Advertisements of Petunia "Punctata," New Verbenas, &c., in the past Numbers of the *Chronicle*.—Providence Nursery, Ramsgate, April 4, 1844.

PELARGONIUMS, AURICULAS, CARNATIONS, AND LILIUM LANCIFOLIUM.

H. GROOM, Clapham Rise, near London (removed from Walworth), by Appointment Florist to Her Majesty, begs to inform the Nobility, Gentry, and Amateurs, that in consequence of the success he has had in the cultivation of the above Flowers at his new Garden (where he requests an inspection of the quality of his plants), he can offer them at very moderate prices. His Catalogue of PELARGONIUMS, AURICULAS, and NEW PLANTS, is now ready, and will be forwarded by post on application. The Trade supplied.

BUSHELL'S Light Seedling DAHLIA, "Emma."—Plants in May, 10*s*. 6*d*. Colour white, tipped with deep cherry; the petals, form, and centre good; the largest, most constant, and free in flowering, of any Dahlia yet propagated, and has obtained several prizes. "Pet Rival," plants in May, 5*s*. Colour, purple maroon; fine cupped petal, and free bloomer; exhibited in several winning stands last season. "Kennington Rose," plants in May, 5*s*.; most constant rose grown. To be had of Messrs. Ansell, Camden-town; S. Girling, Stowmarket; P. and A. Smith, Hackney; and J. Bushell, 12, Hall-place, Kennington-lane.

CARNATIONS AND PICOTEES.

JOHN SLATER, Florist, Cheetham Hill, near Manchester, has on sale upwards of 1000 pairs of healthy plants of Carnations and Picotees, which he will sell at low prices. 20 pairs of Carnations and Picotees, one pair of each variety for 20*s*., package included, provided the selection is left to J. S.

FASTOLFF RASPBERRY.

J. T. WILLMER begs to announce to his Friends and the Public generally that he is able to supply a few hundreds of the above-named Raspberry, in strong Canes, at 40*s*. per 100, warranted to be the genuine kind, packing included, with carriage paid to London; or in less quantity, price in proportion. Fine showing sorts of CARNATIONS and PICOTEES, in 12 kinds, one pair of each, 24*s*. AURICULA.—Strong Plants of showing sorts, 12 plants, in 12 sorts, including basket and packing, the selection left to J. T. W., who possesses a large healthy stock.—Sunbury Nursery, Middlesex, April 5, 1844.

A CATALOGUE of CHOICE DAHLIAS, sold by W. R. WHALE, Florist, &c. &c., Elcot, near Hungerford, Berks.

Whale's Preceptor, a seedling of 1842; bright crimson scarlet; good substance and outline; beautifully cupped petals; splendid show flower; fine habit; height, 4 ft.	10*s*. 6*d*.

Oakley's Surprise, Nihile, &c. &c. &c.

MAY'S "QUEEN OF MAY" CINERARIA.—The above new and beautiful Cineraria is now ready to be sent out by post, or otherwise, at 5*s*. 6*d*. each, including case, prepaid. It is confidently recommended as being one of the most splendid novelties that has been offered in Cinerarias; the colour being a beautiful light sky-blue; the flowers large and of good form; the plants compact, shrubby, and dwarf in growth.

W. M. begs to state that his descriptive List of new, superb Calceolarias may be had on application to William May, Hope Nursery, Bedale, Yorkshire.

W. M. also begs to intimate that he cannot supply any more Eucharidium grandiflorum.

MESSRS. MARNOCK and MANLEY beg to inform their Friends and the Public, that their DESCRIPTIVE CATALOGUE OF FUCHSIAS, VERBENAS, CINERARIAS, DAHLIAS, &c., with a Treatise on the best and most successful Modes of Cultivation, is now ready, and may be had on application.

N.B.—Their beautiful Fuchsia, Marnock's Princess Sophia, is now ready to be sent out; the stock is not large, therefore early orders will prevent disappointment.

Nursery, Hackney, April 5, 1844.

EXHIBITION of CAMELLIA JAPONICA, or Japan Rose.—A Collection of these beautiful Exotics is now in bloom at Chandler & Sons' Nursery, Vauxhall. Admittance gratis.

SPLENDID LARGE, DEEP-BLUE ANAGALLIS and SUPERB CINERARIAS.—Plants of that large, splendid deep-blue, full and complete round-petalled ANAGALLIS BREWERII, being of a strong and vigorous habit, are well adapted for bedding out; 12*s*. per dozen.

SUPERB CINERARIA SEED, saved from the most esteemed named kinds, and other new and beautiful Seedlings, comprising every shade of dark and light-blue, at 2*s*. 6*d*. per packet. Strong flowering plants of the above, 12*s*. per dozen. Applications, including Post-office orders, will be immediately executed.—Direct to Michael Brewer, Sen., Cambridge Nursery.

SEEDLING FUCHSIAS, PHLOXES, and VERBENAS.

S. GIRLING begs to inform the admirers of the above, that he will have fine healthy plants of his superb Seedlings ready for delivery by the 20th of April. S. G. offers them with the greatest confidence, being well convinced of their superiority over any others he cultivated last year, which included about 100 varieties. The Fuchsias have been seen by Dr. Lindley, whose opinion on their merits will be found in the *Gardeners' Chronicle*, pages 528 and 561, of 1843, under the signature "*S. Girling.*"

FUCHSIAS.

CANDIDATE.—Deep crimson tube and sepals, petals bright violet-purple, reflexing so as to show the corolla. Price per plant, 5*s*.

GLOBOSA COCCINEA.—Tube nearly globular, dark vermilion sepals, and violet petals. 3*s*. 6*d*.

HERO OF SUFFOLK.—Dr. Lindley's description of this is—"No. 5 is a handsome seedling, with short crimson vermilion tube and sepals of good substance, the latter expanding so as almost to reflex, after the manner of Magnifica; stamen and pistils much exserted." Price 7*s*. 6*d*.

PHLOXES.

KING OF THE WHITES.—The best white out; height, 3 feet. Price 5*s*.

SPECTABILIS.—Shaded lilac, very fine, height, 3 feet. 3*s*. 6*d*.

DRUMMONDI, var. SPLENDENS, a new annual of great beauty, being of the richest crimson scarlet, and quite circular in form. In packets of 12 seeds: 2*s*. 6*d*. per packet.

VERBENAS.

DEFIANCE.—Bright rosy pink; the best in its class. 3*s*. 6*d*.

TRESOR PARFAIT.—Bright violet purple, shaded with deep crimson; quite distinct from any Verbena known. 3*s*. 6*d*.

S. G. also begs to state that his Catalogue of Florist's Flowers is ready, and may be had on prepaid application; it will be found to contain nearly every novelty of the season, any of which S. G. will be happy to receive orders for, and which shall have every care and attention. The Fuchsias and Verbenas will be sent by post, free of charge, where preferred. The Phloxes are now ready for delivery.

Dane Croft Nursery, Stowmarket, March 23, 1844.

OLIVER'S "Young Heir" Dahlia.—To be sent out the first week of May, at 7*s*. 6*d*. each.—A. Oliver begs respectfully to call the attention of Dahlia-growers to the above Seedling, which gained prizes at the following Open Shows:—Fetton, Sept. 27th, 1842, First Seedling Prize; Fetton, August 31st, 1843, an Extra Prize, Nine Blooms; Fetton, Sept. 28th, 1843, First Seedling Prize, Nine Blooms; Alnwick, Aug. 29th, 1843, in the first stand of 12; also the Premier prize, Self-colour; also the First Seedling Prize, Five Blooms. The above Dahlia is one which the Advertiser flatters himself will give every satisfaction to purchasers, being a free bloomer, and never showing the eye; good petal, good centre, first-rate outline; colour, rosy crimson; height, from 3 to 4 feet. A. Oliver would take one-half in plants from the Trade. The following Nurserymen in the north will be able to supply plants, viz. Newton, Newcastle; Janson and Finney, Gateshead; Hancock and Son, Durham.—Eslington-house, Whittingham, Northumberland.

WARNER & WARNER beg to inform their Friends they can supply all the varieties of Fuchsia, Petunia, and Verbena now out, either in single plants or collections. They have also all the new Cinerarias, Calceolarias, Geraniums, Dahlias, &c., now in cultivation.

Catalogues of the above may be had. Plants of the new black Nemophilla, 9*d*. each.—Agents for the late Mr. Loudon's works.

NOW READY FOR SENDING OUT.

YOUELL AND CO.,

PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN; HIS MAJESTY THE KING OF THE BELGIANS; NURSERYMEN AND FLORISTS BY SPECIAL APPOINTMENT TO HER MAJESTY THE QUEEN DOWAGER.

A SELECT CATALOGUE of the NEWEST and VERY BEST VARIETIES OF FUCHSIAS, VERBENAS, PETUNIAS, CHRYSANTHEMUMS, & ANAGALLIS, offered by YOUELL & Co.

YOUELL & Co., in submitting their Catalogue of FUCHSIAS for 1844, take the present opportunity of drawing the attention of admirers of the above elegant tribe of plants, to their select and superb Collection. They have spared no expense in forming a selection of such as are really good, to the exclusion of many that are mere nominal varieties; and they would refer to the numerous testimonials of success which attended their mode of selecting, last season, collections for Amateurs, for competition at the various Horticultural Exhibitions throughout the kingdom.

YOUELL & Co. being the parties who first sent out per post, with safety, these tribes of plants, are desirous of calling attention to their advantageous method of executing orders, namely, that they will deliver them free of postage (on the receipt of a Post-office order), to any part of the United Kingdom, upon the following terms:—

12 Extra Fine varieties, 12*s*., the Selection left to Youell & Co.
12 ditto ditto 21*s*., the Selection left to the Purchaser.
50 Fine varieties . . 40*s*., the Selection left to Youell & Co.
50 Extra Fine ditto . 60*s*., the Selection left to the Purchaser.

With the exception of those marked thus. *

The plants are strong and healthy, and ready for delivery: thus ensuring to the Purchaser fine plants for competition in the ensuing season.

NEW AND SPLENDID SEEDLING FUCHSIAS.

* "FUCHSIA LINDLEYANA." This brilliant Fuchsia, the entire stock of which is in the possession of YOUELL & Co., is now for the first time offered to the notice of the public.

Its exceedingly large tube and sepals are of the most vivid vermilion, and excessively expansive, surpassing in brilliancy any hybrid that has yet been raised. It was exhibited at the London Horticultural Society's Meeting, Regent-street, and greatly admired, and was pronounced by all who saw YOUELL & Co.'s specimen plant to be the most dazzling object of this tribe they ever witnessed. The foliage and habit exceedingly fine, a most abundant bloomer, and will be found a desideratum to every collection. Plants will be ready for delivery by the first week in April, at 7*s*. 6*d*. per plant. Usual discount to the Trade, when not less than six plants are ordered.

YOUELL & Co., in calling the notice of Amateurs and others to the following seedling Fuchsia, raised in their nursery, beg to state that in the summer of 1842 they bestowed every care in hybridising the best varieties in cultivation, from which they succeeded in raising upwards of 3000 plants, to the flowering of which one house was entirely devoted last year. And although many varieties possessing superior claims to the attention of those cultivating this elegant tribe, were submitted for the opinion of Dr. LINDLEY, and most favourably noticed, yet YOUELL & Co. feel that, in making a selection of the following six varieties, to which a most accurate description is affixed, will prove not only satisfactory to the purchaser, but to themselves.

These are now ready for delivery, and as the stock is very limited, early orders are solicited.

* "QUEEN VICTORIA." Tube and sepals smooth, of a bright vermilion, corolla stout, long, of a fine purple rose colour, forming a good contrast, and of fine texture, price 7*s*. 6*d*. per plant.

* "PRINCE OF WALES." Tube and sepals rosy vermilion, the latter tipped with green, expanding well, and showing a fine corolla of maroon purple; price 7*s*. 6*d*. per plant.
